The presence of advertiser-supported media coupled with media-licensed or character merchandise has become normalized. The distinction between where the advertisement ends and the content begins no longer exists, particularly as children's play both on- and offline becomes a branded environment. Since children are early adopters of new technologies and new media, they are inducted into a media culture and hence a branded culture early in life. Revisiting public policy and cultural expectations concerning the "clear separation" principle becomes even more important in the digital world. The water in which children now tread is murky, and further examination of the water is needed.

Women's Portraits Present in Print Fashion Advertisements

A Content Analysis of Spanish Fashion Magazines from 2002 to 2009

Paloma Diaz Soloaga and Carlos Muñiz

ABSTRACT

This chapter presents the findings of a content analysis of 568 luxury brand (e.g., Gucci, Dior, Loewe, Chanel) print advertisements published between 2002–2005 and 2007–2009 in high-circulation Spanish women's magazines – *Vogue*, *Telva*, *Elle*, *Cosmopolitan*, and *Woman*. We address the following two research questions: (1) Which female stereotypes are used to portray women in the luxury fashion brands' print advertisements? (2) Do certain factors explain the use of each female stereotype in advertising? Our findings reveal the most frequently portrayed role for female models in these ads is the "hedonist and sensual," which shows women above all as objects of pleasure who also narcissistically contemplate their own beauty. This advertising stereotype reinforces and crystallizes the social stereotype of the woman who is *valuable* as long as she is physically attractive.

If, on the other hand, we sum up the "female" historical duty of having to be beautiful, it will also be valid in a broad, abstract sense, which naturally rejects the reduction of beauty, for example, to a pretty face. We would not be violating this concept if we say that a hunchbacked old woman can be "beautiful," because in its broad sense the concept means harmony of the total being in itself, that brings to the work of art, the most harmonious human work in itself, its relationship, not always properly inter-

preted, with “beauty,” and also means the unity of the interior and the exterior with its symbolism, frequently full of circumlocutions, meaning the capacity to always rest upon itself with self-satisfaction.

(Georg Simmel (1983, p. 90))

In the early 1970s, the critic John Berger claimed that “publicity persuades us of such a transformation by showing us people who have apparently been transformed and are, as a result, enviable. The state of being envied is what constitutes glamour. And publicity is the process of manufacturing glamour” (1972, pp. 131–132). But he also pointed out that it is important not to confuse advertising with the pleasure or benefits to be enjoyed from the real things it publicizes: clothes, accessories, cars, cosmetics, baths, food, and so on. But for Berger, publicity is not about objects but about social relations. Its promise is not of pleasure but of happiness: happiness as judged from the outside by others.

This chapter aims to study the female image created by advertisements published in women’s fashion magazines in Spain. The resources and strategies of fashion brands change as time goes by, just as in other market sectors. Fashion advertisements mostly use human models in easily recognizable situations or behaviors, thus resorting to stereotypes in part because (1) we look at advertisements for a very short length of time – fractions of a second – and (2) they target a wide-ranging, diverse audience in terms of age, social class, and culture. Therefore, stereotypes are effective in achieving the objective of the advertisement being understood as quickly as possible, by the largest possible audience. Very often these advertisements target an even larger audience since campaigns are usually directed at international markets where cultural differences increase the need to ensure that the advertisements are understood as easily as possible. One example is a campaign run by the French brand Louis Vuitton for fall/winter 2010. The advertising images inspired by the North American TV series *Mad Men*, set in the United States of the 1950s, made a big impact on others’ brand collections for the same fall/winter season. In 2008 Vuitton, in collaboration with The Climate Project, former US Vice President Al Gore’s nonprofit organization, did a series of ads with celebrities like Catherine Deneuve, Steffi Graf, and Sofia Coppola, among others, who share common interests with the brand. Both are examples of representations of female images present in fashion brands’ graphic ads that can be found in women’s magazines everywhere, in multiple countries. Given the fact that many high-fashion, luxury brands like Vuitton are marketed on an international scale, it is important to study the images contained in their advertisements.

Literature Review: Studying the Portrayal of Women in Advertising

Nearly 40 years have gone by since Erving Goffman published his famous study *Gender Advertisements* in 1976. His analysis of female images depicted in

advertisements sought to demonstrate that women are presented by advertising as a reflection of the values existing in society and culture at a specific time. Goffman's study, which adapted the classic frames of editorial news content analysis to advertisement content analysis, has become an academic model for many scholars studying the portrayal of the female body in the media, as well as for those studying the portrayal of any figure in advertising. In his work, Goffman identified six frames that stem from a perspective of male superiority over women: Relative Size, Feminine Touch, Function Ranking, The Family, The Ritualization of Subordination, and Licensed Withdrawal. These frames allowed him to demonstrate that the image of women is strongly stereotyped by the media and, specifically, by advertising.

Mee-Eun Kang (1997) replicated Goffman's study with advertisements collected between 1979 and 1991, obtaining similar findings. Other works, such as that of Penny Belknap and Wilbert Leonard II (1991), formulated with a methodology that was very similar to Kang's and proposed as a conceptual review of Goffman's study, questioned the validity of the six categories. In their study, Belknap and Leonard claimed that Goffman's methodology was controversial, especially his sampling technique: "Instead of randomly selecting advertisements, he drew a purposive sample. That is, he chose advertisements from newspapers and magazines that were judged to be representative of some none-too-easily understood nor recognized themes reflecting gender differences [...] he deliberately selected advertisements that mirrored gender differences, sometimes ones that captured the nuances of social relationships" (1991, p. 106). In their own study they collected 1,000 advertisements from *Good Housekeeping*, *Sports Illustrated*, *Time*, *MS*, *Gentlemen's Quarterly*, and *Rolling Stone* and found that the frames of Feminine Touch and Ritualization of Subordination were discovered fairly often; Licensed Withdrawal was infrequent; and Relative Size, Function Ranking, and The Family were very rare. From this, they began a debate on whether advertising is a passive reflection of society or an active influence on society.

More recently, Katharina Lindner's work (2004) used Goffman's six concepts as a starting point and enriched them with contributions from other authors, such as Kang (1997) and Jean Umiker-Sebeok (1996). Interestingly, she found that female images in general interest and fashion magazines were still strongly stereotyped, appearing in settings such as kitchens, bedrooms, bathrooms, or unreal and decontextualized surroundings. Meanwhile, the female image had become increasingly objectified, being used as an object of beauty or pleasure. Despite the interest aroused by Goffman's research, his methodology does not actually meet the standards demanded nowadays for quantitative or qualitative analyses, since the categories or frames are established *a priori* by the author on the basis of his subjective opinion.

While some authors continue to employ and/or test Goffman's frames, other scholars take different approaches. For example, prior to Goffman, Alice Courtney and Sarah Wernick Lockeretz (1971) analyzed 729 advertisements published in 1970 in several general US magazines in order to discover whether the portrayal of women was particularly stereotyped and narrowly defined. In their conclusions they highlighted the fact that, despite the feminist demands of that era, very few advertise-

ments could be considered offensive for women. Years later, Courtney and Thomas Whipple (1983) co-authored a book on sex stereotyping in advertising that illustrated the way in which advertisements divide women by contextualizing them in professional or homemaking settings, while drawing our attention to the alarming objectification (dehumanization) of women in advertising. In this same manner, although in a popular way, Jean Kilbourne (1999) documented how advertising objectifies women's bodies in order to sell. Her research, documented in her four influential *Killing Us Softly* documentaries (1979, 1987, 2000, 2010), has been an important contributor to the dialogue.

Gary L. Sullivan and P. J. O'Connor (1988) also conducted analysis of the portrayal of women in advertising compared to their professional performance in real life between 1958 and 1983. This content analysis allowed the authors to affirm that some of the stereotypes identified by studies conducted in the 1970s, such as "a woman's place is in the home" or "women do not do important things or make important decisions," or "women are fundamentally objects of pleasure for men," had changed.

Finally, while the above studies are traditional quantitative content analyses, a growing body of research has sought to analyze the topic from a more qualitative, cultural studies perspective, including the work of Diane Barthel (1988), Carolyn Kitch (2001), Carolyn M. Byerly and Karen Ross (2006), Anthony J. Cortese (2008), and Juliann Sivulka (2009).

The Role of the Media in the Crystallization of Stereotypes

It is well known that stereotypes provide a shortcut for knowledge and offer a way of being easily understood by the majority of the members of society, even though, as Walter Lippmann explains (1997), they can also lead to errors in the interpretation of reality. For Lippman stereotypes are also the guarantee of self-respect of any individual since they protect our identity and understanding of the world surrounding us against the assaults of others. Contrary to Lippmann's sharp but neutral appreciations, Lawrence Blum (2004) gives a very negative description of stereotypes, pointing out that they are largely, though not entirely, false and misleading judges of the groups that render them. Similarly, stereotypes are also immune to counterevidence. For Blum, from a moral perspective, stereotypes are used only with regard to false or misleading generalizations since the falseness is both part of and a necessary condition for them. "It is false, or at least misleading, to say that Jews are cheap, Blacks lazy, Asians good at math, women emotional, and so on" (Blum, 2004, p. 256).

Focusing on the mechanisms through which stereotypes may be acquired, Stangor and Schaller (1996) emphasized that these involve attention, recall, and integration of information. For these authors, it is a fact that stereotypes are learned and can be

changed, first of all through the information that individuals acquire through direct contact with members of other social groups. These authors base their assertion mainly on the individual mental process of creating stereotypes, and pay only scant attention to the influence by which stereotypes may also be learned and changed through indirect sources such as leaders, parents, peers, and the mass media.

Ellen Seiter (1986) considers that media influence is more than evident and demonstrates that television, radio, magazines, the Internet, and so on are central to understanding the normalizing process of stereotyping by individuals. Seiter (1986) and Patricia Devine (1989) also claim that stereotypes are activated subconsciously and applied in a controlled and free manner based on one's decision to use the stereotypic information in a specific judgment. For this reason, many other scholars who have analyzed media content focus mainly on race and gender to find images and representations that might contribute to the reinforcement of social stereotypes (Brown Givens & Monahan, 2005; Cusumano & Thompson, 1997; Gorham, 2006, 2010; Kilbourne, 1990; Valls-Fernández & Martínez-Vicente, 2007). To this end we may cite William Kilbourne, who did an experimental study in 1990 that demonstrated the influence of exposure to stereotypical images of men and women depicted in leadership or nonleadership attitudes.

Nevertheless, regardless of the commercial intentions of the issuer – in the case of commercial communication, we are referring mainly to marketing directors, designers, advertising creative directors, and fashion photographers – social stereotypes crystallize as a result of the repetition of stereotyped messages. Consequently, fashion brand advertising displays only certain models for women: how they should act or present themselves in order to be successful in private and public settings.

It is well known that one of advertising's main aims is to shock its target audience into ultimately purchasing the product that is being promoted. In order to accomplish this, and given the heterogeneity of the members of this target audience, preliminary knowledge must be obtained through analysis of the socioeconomic and psychosocial characteristics, given that these obviously vary according to the socio-cultural context. The first objective is to show, to a wide and heterogeneous group of women, images that they can easily understand and admire. Secondly, advertisers want to create a unique universe of values that can be identified with the brand and never mistaken for others.

While some authors believe that choosing this strategy is a way to save costs, others are doubtful of its true effectiveness in international markets. Nelson and Paek (2007) conclude that proponents of standardization argue for a strategy based on shared consumer traits, economic savings, and the benefits of a shared global brand, while opponents assert the dangers of global strategies due to different local market conditions and cultural uniqueness. Nevertheless, global campaigns cannot be denied in the design of current image strategies by major advertisers.

Fashion brands also resort to these advertising standardization strategies in order to promote their products because they are aware of women's interest, and they continue to put considerable pressure on women when depicting the brand universe

and values that define each fashion house. The majority of advertising campaigns are designed with global markets in mind, and the same advertisements are placed in the magazines of countries that are culturally very different. Most luxury brand campaigns are designed in the country of origin of the brand, mainly Italy, France, Britain, or the United States, and are then placed in fashion magazines in hundreds of countries all over the world.

For example, in 2010, we analyzed fashion advertisements published in high-end magazines from Portugal, China, and Spain to be able to compare women's images from different countries and find differences and similarities among them. Not surprisingly, we noticed that representations of women in fashion magazines were almost the same throughout the world. To simplify, we can say that the main reason for this is that the international fashion brand campaigns are primarily generated in Europe or the United States and then distributed worldwide. Thus the images that we see in fashion magazines in each country are very similar to each other or even the same. However, we should note that "although advertisements can be fairly similar across cultures, the content does not allow us to assess if women share the same meanings cross-culturally" (Nelson & Paek, 2007, p. 79). Moreover, this does not mean that women from these countries all dress the same, since they customize and adapt the outfits and make them local, adding a cultural touch. According to Mooij (2004), global brands are rarely consumed or used in the same way in different countries. However, there is an emphatic predominance of the occidental female stereotype advertised in the fashion magazines.

The advantages and disadvantages of standardizing advertising through the use of stereotypes are not only that they homogenize the image of women offered to society as a whole, but also that real women tend to identify and compare themselves with this stereotype.

A Study of Fashion Brand Advertising

This chapter reports on the findings of a content analysis of 568 print advertisements published between 2002 and 2009 exclusively in women's and fashion magazines in Spain. Unlike Goffman, we did not base our study on a set of frames used as a basis for arranging the advertisements but preferred to undertake the study without the "bias" of such frames, and to allow the results of the content analysis to speak for themselves. Our aim was to allow the advertisements to tell us whether any concrete stereotypes existed, and to indicate the proportion of each stereotype in the overall sample selected. The formulation of a code book was very useful for this purpose, in which we "asked" – in a rhetorical way, since they were unable to talk to us – the female models who were present in the advertisements about their physical features, dress style, poses, or attitudes in front of the camera. Some questions were based on

Goffman and Lindner's categories; others were generated by the researchers trying to find the values that could define stereotypes. On the basis of the images reflected by the models, we attained a "profile" of each model that, when brought together, allowed us to extract the women's general features and the stereotypes generated, as well as their permanence over time since we were analyzing advertisements for seven different years during the period from 2002 to 2009. (Advertisements from 2006 were not included in the analysis since there were insufficient representative advertisements collected from that year.)

Research Questions and Methodology

Given the previous research on this topic, this study was guided by two research questions:

- RQ1 Which female stereotypes are used to portray women in the luxury fashion brands' print advertisements?
- RQ2 Do certain factors explain the use of each female stereotype in advertising?

In order to address these questions, we analyzed print fashion advertisements – in particular luxury fashion brands such as Gucci, Dior, Loewe, or Chanel – appearing in the Spanish women's publications with the greatest circulation: *Vogue*, *Telva*, *Elle*, *Cosmopolitan*, and *Woman* since they comprise the main source of information for consumers, most of whom are women. A total of 97 brands from this sector were identified and classified in turn into six groups, according to the type of product being advertised:

- 1 Clothing
- 2 Cosmetics
- 3 Beauty treatments
- 4 Perfume
- 5 Accessories (handbags, shoes, belts, glasses)
- 6 Others (such as lingerie, jewelry, or watches)

Based on the analysis of these magazines from 2002 to 2009, a set of advertisements was selected to conduct the content analysis, and a total of 568 print advertisements for luxury fashion brands were identified. All luxury fashion ads found during the years under study were included except (1) those that did not include women and (2) those in which the women's features were not visible. We also eliminated duplications. Fifteen percent of sample advertisements were published in 2002, 9.2% in 2003, 15.3% in 2004, 19.5% in 2005, 12% in 2007, 11.1% in 2008, and 18% in 2009.

Since the aim of the study was to determine the female stereotypes or profiles reflected in fashion brand advertising, the "character" in the advertisement was used

as the unit of analysis for the study rather than the fashion brands. Male characters who sometimes appeared in the advertisements accompanying the female characters were not included in this analysis since our focus was specifically on female images.

In order to conduct the content analysis and answer the research questions on the basis of the theoretical framework reviewed, a code book was created. While some researchers carried out their content analyses following Goffman's classifications, we took these frames into consideration only to be able to formulate four groups of questions: (1) those that referred to the descriptive variables; (2) those that referred to some aspects of external appearance; (3) those that referred to the values and stereotypes that the models express through their external appearance, attitude, behavior, or body position; and (4) those that refer to the environment of the place pictured in the advertisement. Lindner's (2004) work was significant at this point, even though we did not specifically replicate her outline since our goal was to let the statistic "talk" about the stereotypes that emerge through this content analysis of the women present in the advertisements.

This process yielded the following main sections:

(1) *Identification of stereotypes.* In order to determine which female stereotypes exist in the fashion advertisements analyzed, the presence (1) or absence (0) of certain aspects or characteristics (29 items) related to the external appearance of the female characters located were coded. Specifically, the study analyzed whether the character reflected "love," "family," "maternity," "listlessness," "weakness," "sorrow," "submission," "triumph," "freedom," "conquest," "faithfulness," "transgression," "sexual attraction," "pleasure," "seduction," "modernity," "comfort," "emotional success," "aggressiveness," "joy," "personal effort," "friendship," "enjoyment," "professional success," "competitiveness," "risk," "violence," "failure," and "homemaking." Because some terms overlapped in their meaning, we operationally defined some words to assist the coders. For instance, joy and enjoyment do not have exactly the same meaning and we defined them to make the coder's job easier: joy was defined as happiness due to a spiritual experience – the contemplation of beauty, seeing something good – whereas enjoyment was defined as a pleasure caused by a physical experience – eating, smelling, or touching something; it is also related to sexual feelings. We did this for the Spanish words, since each language has its linguistic differences that correspond to certain concepts.

(2) *Predictor variables in the use of stereotypes.* In order to study the factors that would explain the presence of each stereotype in the advertisements or, to be more precise, the fashion advertisements analyzed, 19 variables were established that would be either independent or predictor variables in the study. Specifically, the following characteristics of the advertisements were studied and grouped into categorical variables: the type of product advertised (1 = clothing, 2 = beauty products, 3 = perfume, 4 = accessories, such as handbags, shoes, watches, or belts); the social class of the female character, paying attention to her clothes and accessories, as well as the context of the advertisement (1 = lower or middle class, 2 = upper class) – this

categorization was used when just a single character portrayed as belonging to the lower class was detected; the character's build (1 = extremely thin, 2 = slim, 3 = normal). To explain the interest of observing the context of the advertisement in more detail, what we were trying to find out when we looked at the income-level appearance of the character was whether this was evidence that the luxury brands sometimes emulated the low-income classes as a sales proposition.

The presence of the following characteristics was also coded dichotomously (1 = yes, 0 = no): (1) whether the advertisement used people who were famous; (2) whether the models were young looking; (3) whether the models had athletic bodies; (4) whether the models had androgynous features; and (5) whether the models were being seduced by men.

Even though we did not analyze male images, we paid attention to men's interactions with women. This was essential for the definition of women's attitudes toward men and toward other women. In this sense it is a common assertion that women usually dress to impress other women more than to impress men. Women somehow tend to think that men pay attention not to the fashionable characteristics of their outfits but to their bodily appearance as a whole. Even though it is impossible to verify this hypothesis solely with the content analysis we carried out, at least we could offer an idea of what is important in women's representations, and thus demonstrate what forms part of the ideal of women today.

Another clarification necessary at this point refers to the meaning of the "androgynous aspect" of the models. By this characteristic we refer to the intention of the photographer and the brand to show women who are not very feminine but have some "masculine" features: having short hair, wearing a tuxedo or tailored men's suit and/or braces, posing in a typical and well-recognized male position – for instance, portrayed as Indiana Jones or Dracula. To ensure that the coders clearly understood this component, we showed them some examples of each before they started.

(3) Furthermore, a *dichotomous evaluation* was performed of whether the advertisement displayed nude or semi-nude bodies, perfect bodies, or just the character's face; whether the model's body was used in the advertisement as an aesthetic value; and whether the external appearance of the character was related to happiness. Finally, and more closely related to the space recreated in the advertisements, an analysis was conducted to determine whether in the advertisements the consumption of the product was related to beauty, conveyed luxury, and was realistic, whether the product brand was presented as a status symbol, and whether out-of-focus images were used when advertising luxury brands. The answer options were 1 = yes and 0 = no.

At this point we also need to clarify the statistical techniques we used to answer our research questions. As was mentioned previously, we collected a number of advertisements on which we conducted a content analysis of the visual information that the models gave us through their facial expression, outfit, posture, and so on. We then applied factor analysis to the resulting data, with the main goal being to

find groups of homogeneous variables from a large number of variables. Those homogeneous groups were made from the correlation of variables among them; we also tried to ensure that the groups were independent from one another – in other words, homogeneous inside the group, heterogeneous among others. Since we collected a great deal of data from the content analysis, we were interested in knowing whether the answers could be associated in a typical path; that is, if there were variables with a common significance. Through this process we could simplify the number of dimensions that might explain the images of the advertisements and the stereotypes that the models represent. For this aspect we recommend reviewing the works of Papacharissi and Oliveira (2008), Semetko and Valkenburg (2000), and d’Haenens and de Lange (2001).

Factor analysis is a technique that can reduce data dimensions. Its goal is to look for the minimum dimensions that can explain the maximum information that the data contain. For this reason it was the perfect tool to achieve our aim. In the case of this research, all variables were codified as “dummy,” and we measured the presence or absence of certain characteristics in the advertisements’ models. The reason for using factor analysis in this project was to reduce the data with the idea of detecting the stereotypes that emerge from the fashion ads.

A group of university students from the Centro Universitario Villanueva and the Universidad Complutense de Madrid assisted in the coding and recording of the units of analysis. An initial training period in coding was completed in order to guarantee the highest possible level of homogeneity in the interpretation of the questions, and the first 20 units of analysis were analyzed jointly. This was of particular importance in those questions referring to the values that were present in the characters, and consequently the meanings of some of the terms that might be ambiguous (e.g., pleasure, joy, listlessness, weakness) were defined. Afterwards, once the data had been coded and recorded in the databases, a statistical analysis was conducted using the program SPSS v.15.0, the results of which were interpreted in relation to the research questions put forward.

Findings

Female Stereotypes Portrayed in Advertising

As mentioned earlier, in order to answer the first research question, it was determined whether the characteristics or values of the women portrayed in the advertisements could describe certain stereotypes most frequently used by advertisers to present luxury fashion brands. For this, an initial factor analysis, with varimax orthogonal rotation, of the principal components was completed using the 29 items that define the “stereotype features” in order to determine the extent to which they were organized among themselves into different components or factors. The quality of this factor analysis was tested using the Kaiser-Meyer-Olkin (KMO) test, which

produced a value of .72, and Bartlett's test of sphericity, which was statistically significant, $\chi^2(406) = 4130.438$, $p < .001$. All of these data demonstrated the quality of the analysis conducted. A total of nine factors were obtained from this initial factor analysis, which together explained 60.48% of the variance. In order to simplify the factor solution, the factors that consisted of a single item were eliminated. The internal consistency of each of the remaining items was also analyzed (Cronbach's alpha) in order to rule out the items that did not achieve an acceptable level of reliability for this type of exploratory study. This produced a total of 18 items that represented the women's characteristics or values, which are grouped into the four factors with the highest internal consistency.

In order to corroborate whether these four factors bring together the characteristics of the characters in such a way that they could be considered as different female stereotypes in advertising, another factor principal component analysis, with varimax rotation, was performed to determine the relationship of these factors within the resulting factors. The resulting Kaiser-Meyer-Olkin (KMO) statistic offered a value of .75 and Bartlett's test of sphericity was statistically significant, $\chi^2(153) = 2733.259$, $p < .001$, and therefore the quality of the analysis conducted was established. Based on the results (see Table 3.1), the existence of four factors could be determined which

Table 3.1 Second factor principal component analysis (with varimax rotation) of the characteristics or values reflected by the women in the advertisements

Characteristics or values of the women	Factors			
	1	2	3	4
The character conveys competitiveness	.750			
The character conveys professional success	.726			
The character conveys triumph	.684			
The character conveys modernity	.625			
The character conveys transgression	.615			
The character conveys conquest	.611	.458		
The character conveys emotional success	.551		.470	
The character conveys pleasure		.742		
The character conveys sexual attraction		.722		
The character conveys seduction		.595		
The character conveys joy		.545		
The character conveys family			.818	
The character conveys maternity			.735	
The character conveys love		.416	.644	
The character conveys homemaking			.607	
The character conveys sorrow				.801
The character conveys weakness				.761

Eigenvalue	3.042	2.479	2.367	1.937
Percentage of explained variance	16.899	13.775	13.152	10.763
Total percentage of explained variance	54.589			

Figure 3.1 Mean score of the female stereotypes detected in advertising.

together explained 54.59% of the variance. These factors matched other female stereotypes present in the advertisements analyzed:

- 1 *Modern woman* ($\alpha = .78$, $M = 0.32$, $DE = .29$), consisting of the items in which the woman reflected the values “competitiveness,” “professional success,” “triumph,” “modernity,” “transgression,” “conquest,” and “emotional success.”
- 2 *Traditional woman* ($\alpha = .67$, $M = 0.02$, $DE = .11$), consisting of items that are related to “familiarity,” “maternity,” and “homemaking.” “Love” was eliminated from the scale since it decreased the internal consistency of the indicator.
- 3 *Hedonistic-sensual woman* ($\alpha = .65$, $M = 0.40$, $DE = .32$), consisting of the items “sexual attraction,” “pleasure,” “joy,” and “seduction.”
- 4 *Fragile woman* ($\alpha = .66$, $M = .09$, $DE = .21$) related to images of “sorrow,” “weakness,” and “listlessness” (see Figure 3.1).

Stereotype Usage Patterns Over Time

Once the female stereotypes present in advertising had been detected for the years studied, we went on to investigate whether a joint usage pattern existed among them in the advertisements that were analyzed. As can be seen in Table 3.2, a significant joint presence was observed of the *hedonistic-sensual woman* and *modern woman* stereotypes, $r(566) = .118$, $p < .01$. Nevertheless, their association with the *traditional woman* stereotype, $r(566) = -.090$, $p < .05$, and, in particular, with the *fragile woman* stereotype, $r(566) = -.137$, $p < .001$, was negative. This proves that there was no tendency to present these stereotypes together in the fashion advertisements analyzed. The joint use of the *fragile woman* and *sensual woman* stereotypes, $r(566) = .132$,

Table 3.2 Correlation between female stereotypes and year of publication

	1	2	3	4	5
Modern woman	–	.118**	–.090*	–.137***	.163***
Hedonistic-sensual woman		–	–.149***	.132**	–.031
Traditional woman			–	–.068	–.136***
Fragile woman				–	–.181***
Year of publication					–

$N = 333$. The associations were significant at *** $p < .001$; ** $p < .01$; * $p < .05$.

$p < .01$, was also detected, while a separation strategy existed in the advertisements for the *sensual woman* and *traditional woman* stereotypes, $r(566) = -.149$, $p < .001$.

Moreover, on studying the association between each stereotype and the variable related to the year of publication (see the results in Table 3.2), a significant correlation was detected with the *fragile woman*, $r(566) = -.181$, $p < .001$, and the *traditional woman*, $r(566) = -.136$, $p < .001$, stereotypes. Therefore, it seems that there was a tendency to use these stereotypes less in advertising over the years, although this decrease was not particularly sharp considering the value of the relationship (see the data in Table 3.2). Regarding the *modern woman* stereotype, $r(566) = .163$, $p < .001$, the findings offer an image of moderate linear growth in its use throughout the years studied. A linear association was not detected for the *hedonistic-sensual woman* stereotype and therefore its presence remained stable throughout the eight years studied.

Explanatory Factors for the Use of Stereotypes in Advertising

The identification of the four female stereotypes made it possible to address the second research question, that is, to determine the factors that affect or explain the use of each stereotype in the advertisements studied. For this, multiple linear regression analyses were conducted using each of the stereotypes as a criterion or dependent variable. The characteristics of the advertising message were taken as independent or predictor variables of the stereotypes, making it necessary to transform the items that were of a categorical nature. Consequently, based on the variable “product type,” four new variables were generated in which the presence of each type of product was measured (clothing, cosmetics, beauty treatment, or accessories), with the absence corresponding in each case to the groups that were not selected or that of “others,” which was left out of the regression analysis. The same procedure was followed for the “social class” variable, where the variables for lower class and upper class were generated; the “build” variable, where the categories extremely thin and

normal formed the new dummy variables; and finally, the type of brand, creating two dichotomous variables that measured the presence of conventional or unconventional brands. The rest of the predictor variables, which were dichotomous in every case, were used just as they were defined, contemplating the presence (1) or absence (0) of a certain characteristic.

The first multiple linear regression analysis was conducted, with the successive step method, using the *modern woman* stereotype as the criterion variable. This method was selected right from the start since it is the most suitable for an exploratory study. The regression model was statistically significant, explaining 53% of the variance, that is, the presence of the stereotype in advertising. Therefore, 11 factors were identified that explained the presence of this stereotype in advertising, 9 of which corresponded to the character's characteristics and the other 2 to the formal aspects of the advertisement. The most important of the variables related to the character was that the character displayed androgynous features, $\beta = .526$, $p < .001$, followed at a distance by a slim build, $\beta = .168$, $p < .001$, and being represented as a member of the upper class, $\beta = .135$, $p < .001$. The influence was also acceptable when the advertisement showed the model's body as an aesthetic value, $\beta = .133$, $p < .001$, the model had a normal build, $\beta = .121$, $p < .001$, an athletic body, $\beta = .115$, $p < .001$, or was portrayed as a member of the middle class, $\beta = .103$, $p < .01$. The fact that the character was being seduced by a man, $\beta = .070$, $p < .05$, or was not nude, $\beta = -.070$, $p < .05$, was also an explanatory aspect of the use of the *modern woman* stereotype, although to a lesser extent. Finally, the fact that the advertisement related product consumption to beauty was observed as an explanatory formal aspect, $\beta = .196$, $p < .001$. The presence of this stereotype tended to decrease in beauty product advertising, $\beta = -.055$, $p < .10$, although the result was tendential rather than significant (see the data in Table 3.3).

Another multiple linear regression analysis was conducted, with the successive step method, but in this case to determine which variables predicted to a greater extent the presence of the *hedonistic-sensual woman* stereotype in advertising. The regression model was also statistically significant and managed to explain 30% of the variance of the stereotype being analyzed (see the data in Table 3.4). In short, six factors were observed to be significantly explanatory regarding the use of the stereotype. As a result, the advertisements that mostly used the *sensual woman* stereotype were the ones that showed models being seduced by men, $\beta = .330$, $p < .001$, that showed nude or semi-nude bodies, $\beta = .197$, $p < .001$, and in which the product consumption was related to beauty, $\beta = .336$, $p < .001$. The greater presence of middle-class characters was also an explanatory variable, $\beta = .108$, $p < .01$, tending in this case to make the presence of the use of the *sensual woman* stereotype increase. Moreover, certain variables used as independent variables in the model explained the use of the stereotype, but in this case in a negative fashion. Therefore, when the advertisements advertised beauty products, $\beta = -.103$, $p < .01$, or the model did not display androgynous features, $\beta = -.100$, $p < .01$, the use of the *sensual woman* stereotype decreased.

A multiple linear regression analysis, with the successive step method, determined that there were seven variables that predicted the use of the *fragile and/or submissive woman* stereotype. Once again, the regression model was statistically significant, explaining in this case just 20% of the variance of the female stereotype studied (see the data in Table 3.5). A review of the results made it possible to observe that the factor that explained to a greater extent the presence of this stereotype in the adver-

<i>F</i>	20.814***		
<i>R</i> ² corrected	.20		

N = 568. The associations were significant at ****p* < .001; ***p* < .01; **p* < .05.

tisements analyzed was the fact that they presented characters with an extremely thin build, $\beta = .262$, $p < .001$. The fact that the advertisements related product consumption to beauty, $\beta = .213$, $p < .001$, the character was young looking, $\beta = .154$, $p < .001$, or displayed an athletic body, $\beta = .124$, $p < .01$, also explained in a positive manner the use of this stereotype. It also explained positively the fact that beauty products were being advertised, $\beta = .008$, $p < .05$, although this association was very slight. Furthermore, two variables were detected that generated a less frequent use of the stereotype: the fact that the character's external appearance was related to beauty, $\beta = -.145$, $p < .001$, or that the character displayed androgynous features in the advertisement, $\beta = -.106$, $p < .05$. In both cases, the appearance of these characteristics in the advertisement was related to a lower presence of the *sensual woman* stereotype.

Finally, the predictor variables of the use of the *traditional woman* stereotype were analyzed by means of a multiple linear regression analysis in successive steps in order to detect just the explanatory variables of the stereotype usage. The resulting equation was statistically significant, explaining 13% of the stereotype variance. Of the 8 items detected as explanatory, 5 were related to the formal features of the advertisement. This stereotype was the one whose presence in the advertisements was explained to the greatest extent by the formal aspects rather than by the character's physical characteristics (see the data in Table 3.6).

The fact that in the advertisement the brand presented was being portrayed as a status symbol, $\beta = .221$, $p < .001$, that cosmetics were being advertised, $\beta = .127$, $p < .01$, and that it had a highly realistic appearance, $\beta = .104$, $p < .05$, was the formal aspect that contributed positively to the increase in the presence of the stereotype. With regard to the character's features, the fact that the model's external appearance

was related to happiness, $\beta = .154$, $p < .001$, and she seemed young looking, $\beta = .090$, $p < .05$, also positively explained the use of the stereotype. As in the other regressions completed, factors that contributed negatively to the presence of models characterized as traditional women were also detected. This occurred with the presence of models displaying androgynous features, $\beta = -.160$, $p < .001$, the portrayal of luxury in the advertisements, $\beta = -.256$, $p < .001$, or the association of the advertised product with beauty, $\beta = -.100$, $p < .05$.

Discussion and Conclusions

As can be observed throughout the text and tables in this chapter, the most frequently portrayed female stereotype in luxury fashion brand advertising studied was the "hedonist and sensual," which shows women, above all, as objects of pleasure. Its presence can be described as overabundant since it represents a very high percentage of the overall sample. The woman depicted in this stereotype is mainly concerned with her physical appearance for the purpose of seducing or being seduced, while displaying herself as a source of pleasure and narcissistically contemplating her own beauty. This advertising stereotype reinforces and crystallizes the social stereotype of the woman who is *valuable* as long as she is attractive on the outside.

The stereotype with the second highest presence in the sample is the so-called "modern woman," defined by values that are similar to those of the "hedonist and sensual" stereotype but with a greater portrayal of the concept "modern," that is,

with the aesthetic use of features that the coders interpreted as “current,” “ground-breaking,” and “up-to-date.” This means that compared with the hedonist woman, the modern woman appears to be androgynous, is strikingly thin, and is identified with the upper class. Remarkably, together these two stereotypes make up 72% of the total sample. This is even more disturbing if we consider that the fragile woman represents only 0.08% of the sample and the traditional woman just 0.02%. In other words, they are underrepresented as female stereotypes.

Perhaps one of the most noteworthy aspects to emerge after analyzing and comparing the findings of studies conducted from the 1960s to the 1980s is precisely the suppression of the family- and home-loving female stereotype, and a change of direction toward the hedonist woman, who is concerned with her appearance, has no ties or commitments, and seeks self-affirmation in the conspicuous consumption discussed by Thorstein Veblen (2008). Even though we only analyzed advertisements published in fashion magazines and not general interest or housekeeping magazines, we should point out that Goffman’s study also had fashion advertisements in his sample, as did other authors.

Therefore, the media and the advertising structure – at least those related to the fashion world – do not seem to have achieved the expected triumphs of liberation proposed for female imagery since the times of Erving Goffman or Alice Courtney, given that the stereotype has simply veered from women who are dependent on men to women who voluntarily objectify themselves to achieve their goals. In both cases, the portrayal of women and the role they play is still that of submission, although it could be said that nowadays submission is voluntary, a point that is yet to be proved.

As explained earlier on, the image of the traditional woman, defined by the features of familiarity, maternity, and homemaking, is practically nonexistent in the high fashion advertisements. Despite the harsh criticism of radical feminism in the 1970s, current postfeminist trends no longer view maternity as a symbol of submission or a strategy of man’s power over woman. Nevertheless, fashion brands do not select images of women who are committed to maternity or family. They have discovered that it is more interesting in terms of sales to favor the image of an “independent” woman who is fully self-sufficient. We have highlighted the word independent because the woman portrayed does not appear to be fully independent, since she is not depicted as a working professional with the capacity for self-finance. We definitely consider that this can continue to nourish an artificial need to possess objects and use beauty to attain the desired objects: the conspicuous consumption defined by Veblen.

This simply consolidates a stereotype – unconnected to reality – of a woman who succeeds in life exclusively by herself, without any emotional, personal, freely acquired commitments. The majority of women all over the world continue to consider the values of maternity, family, and love as essential components of self-fulfillment.

We believe that these female stereotypes can also have long-term consequences on the development and consolidation of sexual identity. Specialists in this field like

Jutta Burggraf (1995) indicate that three aspects must be considered in the sexual identity development process: biological gender, psychological gender, and social gender. The latter, also known as “civil gender,” is assigned to each person at birth and expresses the way in which that person is perceived by those surrounding him or her. It is the result of a cultural and historical process that is unique to each individual and highlights the functions, roles, and stereotypes that are allocated to diverse groups of people in every society. Psychological gender refers to each person’s psychic experiences and their awareness of belonging to a specific sex; it normally coincides with a person’s biological gender, although it can also be profoundly affected by education, culture, and the environment in which he or she lives, particularly during childhood and adolescence.

Without going into a detailed analysis, since we do not have sufficient data and it is not the objective of this chapter, we consider that the development of the psychological gender can also be affected by this media phenomenon.

We would argue that blaming men for this excessive presence of stereotypes seems to be unreasonable. In her book about women who have worked in the US advertising industry since its origins, Juliann Sivulka (2009, pp. 17–18) indicates that “women became increasingly involved in the design, marketing, and advertising of commodities, they also had a significant influence in shaping lifestyles, perpetuating stereotypes, and engendering the practice of consumption as a feminine pursuit,”¹ thus demonstrating that very often it is women, and not just men, who have contributed to the perpetuation of certain social stereotypes in the way in which they show reality through advertising.

Once more the initial assertion emerges: society is a reflection of advertising and advertising influences society, in some way making it change and progress and maintain the systems of the past. After all, we can state that they both influence each other, but the media have a special responsibility since they might be challenged about the evil consequences of using stereotypes on purpose to harm or degrade a group or just to perpetuate a disrespectful image of it. But luxury brands have no conscience about doing so with women. Or do they?

Marketing Militarism to Moms

News and Branding after September 11th

Mary Douglas Vavrus

ABSTRACT

This essay fuses a feminist analysis of news media with political economy and branding research to examine a case study of how a group of mothers – “Security Moms” – became branded and pressed into profitable service for the Republican Party and a “peace through strength” think tank. I argue that constructed identities like this one, which come in and out of vogue in mainstream news media, tell important stories about the media’s relationship to feminism. Since the 1990s, news stories in the United States have popularized groups of women and men supposedly cohering around particular practices: “Soccer Moms” and “NASCAR Dads,” for example. Such identities not only prove to be profitable for corporations, they also politicize identities and reinforce both neoliberalism and self-surveilling governance.

Walking through a parking lot several years ago I spotted a bumper sticker that caught my eye. “Soccer Mom and Proud of It!” it exclaimed. This bumper sticker stuck out not only because I have researched the Soccer Mom identity and how it has been used by mainstream news outlets to talk about women as a swing-voting bloc (Vavrus, 2002), but also because it underscored a phenomenon this chapter addresses. That is, the woman who drove this shiny new SUV had willingly adopted a media-generated, media-circulated label for her identity, and in the process had

given herself over to being part of the desirable Soccer Mom niche market – one that, I argue, has attained the status of a brand. That the Soccer Mom has attained the status of a brand is evident in the various sites in which that label has appeared – this bumper sticker, t-shirts, electoral politics, advertising campaigns, marketing literature that predicts women's consumer habits – and in how the label circulates culturally to define a group of women. But I am less interested in self-professed Soccer Moms than I am with a larger process: how and why groups of people are constituted and then labeled by mainstream news media and what happens to these labeled groups once they are brought into existence. This chapter's case study is based on one such group: Security Moms.

Soon after the United States had begun its preemptive war on Iraq and then President Bush had declared "Mission Accomplished," and amidst a massive propaganda campaign to convince the public of Iraq's Saddam Hussein's involvement in the events of September 11, 2001 (McLaren & Martin, 2004, p. 288), the Security Mom debuted in news narratives about women and electoral politics. The Word Spy website defines a security mom as a "woman with children who believes the most important issue of the day is national security, particularly the fight against terrorism" (www.wordspy.com/words/securitymoms.asp). Security Moms emerged during the 2004 presidential campaign season ostensibly to identify a group of women predicted to be a swing-voting bloc, much like the Soccer Moms of preceding campaigns (e.g., see Tumulty & Novak, 2003); but unlike Soccer Moms, Security Moms' public statements legitimated both right-wing military policy and a patriarchal gender dynamic prevalent in public discourse after September 11, 2001 (Enloe, 2007; Faludi, 2007). As this chapter will illustrate, news discourse mainly frames Security Moms as being desperate for protection, especially that offered by a strong patriarchal figure like George W. Bush, whom they claim to trust completely. In their performance of Bush administration propaganda about the War on Terror, Security Moms' media constitution encourages adherence to a historically specific, post-9/11 security regime, their fearfulness presenting a rationale for heightened state surveillance and the incorporation of surveillance and security technologies into their domestic lives (Grewal, 2006; Hay, 2006).

Media institutions in the United States continually produce new labels like "Security Mom" for human behaviors, compressing layers of complex and often contradictory practices into catchphrases: think "Mean Girls" or "Generation X," for example. Instead of taking these labels at face value, this chapter posits that the gendered life practices captured in these phrases and then circulated throughout the media in both news and entertainment are more significant than their light-hearted media treatment would suggest. Some of these labels evolve into brands as they circulate through media windows, their meanings becoming increasingly multi-layered and valuable for political institutions, political parties, polling organizations, media corporations, and the public relations and marketing industries.

Following Rakow (2010), who argues for the value of analyzing identity, my research challenges "the notion of identity as a stable and unvarying natural category

without political or material consequences” (p. 139). She cites the “rising incidences of hatred and threatened violence in response to [Barack] Obama’s election,” which illustrate starkly that the “politics of gender, race, and class are far from over.” In this example alone, it is “possible to see the contested and arbitrary nature of identity categories, as well as what is at stake in the process to define and enforce them” (p. 139). My analysis of media-constructed identities relies mainly on the news media’s own terms for them, and traces linkages between these identities and the institutions that constitute and circulate them. What I argue is that media-constructed identities come into existence as a result of a confluence of efforts by powerful and resource-rich organizations that stand to gain when these identities are perceived as *prescriptive* as well as *descriptive*. I concur with Fejes, who asserts that, “[u]pdating Foucault, it would seem that today the consumer-based media, and not the state, the church, or the scientific professions, are the far more effective creators and regulators of identities and desires” (2001, p. 207).

Constructed identities that become brands, and come in and out of vogue in mainstream news media – like Security Moms and Soccer Moms – tell important stories about both the media and the political interests that influence media content. Since the 1990s, US news media have popularized groups of women and men whose identities supposedly cohere around particular practices: “Soccer Moms” and “NASCAR Dads,” for example. I focus this chapter on a case study of Security Moms, which reveals the patterns of representations used to construct this identity as well as the political stakes in its public acceptance. I argue that this case of constituting and politicizing identity – branding – encourages governance of gendered conduct that aligns with the military and foreign policy agendas of the Bush White House after September 11, 2001.

Because gender is crucial to the constitution of this media identity, I utilize a feminist analysis, the chief goal of which has been articulated clearly by Riordan (2002):

Feminism seeks to understand and theorize power as it pertains not only to women, but also to other groups marginalized on the basis of their race, class, sexuality, religious background, ethnicity, age, dis/ability, etc.” (p. 13, n1)

In feminist scholarship, gender is the primary, albeit not the exclusive, aspect of interest; as Dow and Condit (2005) argue, feminism is “ultimately oriented toward the achievement of ‘gender justice,’ a goal that takes into account the ways that gender always already intersects with race, ethnicity, sexuality, and class.” Moreover, “gender justice may include but can also go beyond the seeking of equality between men and women, to include understanding of the concept of gender itself as politically constructed” (p. 449). This is, as van Zoonen (1994) has phrased it, a cultural process: “a negotiation over meanings and values that inform whole ways of life” (p. 41). Such a negotiation is evident in almost any discourse in which mothers and their conduct are central, as they are in this case study.

Because the Security Mom identity is produced and reproduced in news media, I focus on these narratives. News texts possess credibility for being straightforward, transparent reflections of reality,¹ and thus express normative lessons to viewers, listeners, and readers about how they should understand and fit into the world around them; for this reason, they are potentially significant for establishing norms in all sorts of areas: gender, race, class, politics, and so on. Consequently, news media provide fertile ground for entrenching masculine dominance and its unfortunate counterpart, feminine irrelevance, and have therefore long inspired feminist scholars to both analyze and alter news reporting about women and feminism (for an excellent and comprehensive review of the “historic dialog” between news and feminism, see Barker-Plummer, 2010).

Gallagher’s (2005) enormous (and enormously useful) report on gender and international news media reveals a number of unsettling trends in mainstream news found in 76 countries from around the world. Among other trends, she shows that women are “dramatically under-represented in the news,” that “women’s points of view are rarely heard in the topics that dominate the news agenda,” that “as authorities and experts women barely feature in news stories” (p. 17), and that “news on gender (in) equality is almost non-existent. [...] Stories with a gender equality angle are almost completely absent from the major news topics of politics (3%) and the economy (1%)” (pp. 19–20). Such patterns only reinforce the legitimacy of women’s invisibility; as Gallagher points out, “if issues and people do not make the news, they can be dismissed as unimportant. They need not command public attention” (p. 28). I would add that on those occasions when gender is front and center, it is likely to take the form of an identity such as Security Mom – one that serves a marketing purpose of promoting a lifestyle, a politics, or some combination.

Some feminist scholars, myself included, have concluded that *postfeminism* informs media representations of women and girls (Gill, 2007; McRobbie, 2009; Tasker & Negra, 2007; Vavrus, 2002). I have defined postfeminism as a “revision of feminism that encourages women’s private, consumer lifestyles” (Vavrus, 2002, p. 2) – one that “rejects feminism’s more provocative challenges, such as those grounded in critiques of capitalism and class privilege” and takes for granted – not to mention benefits from – the gains brought about by the first and second waves; however, postfeminism asserts that “feminism actually harms women, overall, because it gives women unrealistic expectations – that we can ‘have it all’” (p. 22).

In this chapter, I use the term postfeminism, although I recognize that Douglas (2010) departs from the term, substituting “enlightened sexism” in its place. Her rejection of the term is due to its suggestion

that somehow feminism is at the root of this when it isn’t – it’s good, old-fashioned, grade-A sexism that reinforces good, old-fashioned, grade-A patriarchy. It’s just much better disguised, in seductive Manolo Blahniks and an Ipex bra. (p. 10)

Postfeminism does indeed reveal sexism at its core and reinforces patriarchy, but it also illuminates feminism – for both positive recognition and blame. In other words,

although feminism blaming is a recurrent theme in postfeminism, it is accompanied by an implicit recognition of the gains for which feminism and feminists are responsible (Vavrus, 2010). I have found that what Gill (2007) calls a “postfeminist sensibility” pervasive in news discourse, including that which constitutes Security Moms. That is, the Security Mom brand is productive of a lifestyle used to sell a militaristic politics of motherhood in much the same way as consumer products are marketed; in this way it aims to govern private as well as public conduct by appealing to women’s desires to exercise political agency and choose a politics that will best serve their family’s interests.

As I will show, this identity does not arise organically or emerge from average women’s everyday practices, but is instead produced as part of an Astroturf campaign (see Stauber & Rampton, 1995, for an explanation of hallmarks of and purposes for such a public relations campaign) that attempts to maternalize security to advance the agenda of the Bush White House and minimize the gender gap for Republicans. Because the influence of advertising, public relations, and marketing is strong and even ubiquitous in news today (e.g., see Bagdikian, 2004; McChesney, 2008; Potter, 2010), news media research must consider how news content is shaped by these industries as well. I have done this examining NASCAR Dads (Vavrus, 2007) and Soccer Moms (Vavrus, 2002), for example. Other feminist work in this vein can be found in King’s (2006) work on cause marketing and Gunn and Vavrus’s (2010) research on the marketing of menstruation-related remedies. Using a Foucauldian analysis of biopower, these latter two consider the means by which women’s bodies, cycles, and diseases may become the targets of marketing campaigns that center on the production of self- and other-surveilling subjects.

The analysis of Security Moms in this chapter also draws on the concept of biopower: the “power over life” (Foucault, 1978, p. 139) that modern institutions seek to manage in populations by encouraging self-disciplining subjects who exercise “judgment and self-judgment concerning the normal and abnormal in relation to an identified norm” (Gunn & Vavrus, 2010, p. 118). Biopower explains a gendered brand such as Security Mom’s function as a governing apparatus: the examples I provide in this chapter illustrate how the brand attempts to establish a normative discourse about family life, domesticity, and emotional labor in the post-9/11 United States using terms that emphasize the well-being and safety of the population of mothers and children it aims to govern. With such a population of parents, the discursive constitution of the power over life definitive of biopower emerges clearly with emphasis on filial responsibilities (especially pronounced for mothers). This brand thus provides a functional model of gendered conduct; by analyzing it, my goal, like Dean’s, is to lay bare its “taken-for-granted character” (1999, p. 36), understand the power relations that inhere within it, and illuminate the political stakes for its incorporation as a governing discourse. The remainder of this chapter explains, first, my rationale for and use of the Foucauldian concepts of governmentality and biopower in this context, and, second, illustrates how these operate with the branding process generally, and finally, with the Security Mom brand in particular.

Governing Gender through Brands

According to the CEO of Saatchi & Saatchi, Kevin Roberts, the goal of branding is to inspire “loyalty beyond reason” among consumers (quoted in Conley, 2008, p. 2). To achieve this, marketers use numerous means and sites to attempt consumer identification with their products and services, so that each brand appears to hail us personally, as individuals, as we aspire to reach our goals (Gobé, 2001; Turow, 2006). Lury (2004) believes that brands are “compelling object[s] of sociological concern,” not least because they are “linked to practices of government and self-government” and have “regulatory effects” (p. 150) on the consumers they hail. Typically associated with consumer products, brand image is created using information gained through test marketing consumers, mining demographic and psychographic data, and scrutinizing the results of marketing surveillance conducted by services like ACXIAM and Epsilon. According to Vass (2005), imprinting a brand’s aura on popular consciousness requires inundating the public with as many means of communicating its marketing message as possible, including press releases, advertisements in multiple sites, direct marketing, news stories, and face-to-face contact.

Each identity brand I have scrutinized – from Soccer Moms to NASCAR Dads to “metrosexuals” – has been featured prominently in news media for a period of at least a few months, and represents efforts by numerous organizations to constitute it, articulate it to a population, and reference it with a label that simultaneously expresses organizational goals for governance and links these to the agendas of larger organizations. Deployment of the NASCAR Dad brand, for example, benefited the news organizations that aired stories about it, NASCAR broadcasters, the hundreds of NASCAR-sponsoring corporations, various branches of the military that recruit at NASCAR races, and the Republican Party (Vavrus, 2007). Each brand encourages behaviors and desires that fall within bounds established in the circuits of exchange between these organizations. Arvidsson refers to brands such as these as “political brands,” and argues that they offer “an answer to the homelessness of post-modern subjects. Like commercial brands [they profit] from this homelessness by offering a possibility for identification within a prestructured space” (2006, p. 92).

Thus, viewing constructed, gendered identities as brands may reveal the purposes for these persistently invoked and circulated constructions and how and where they articulate to governing agendas. The concept of governing conduct emerges from Michel Foucault’s later writings on governmentality (see Foucault, 1991), in which government refers to “‘the conduct of conduct’: that is to say, a form of activity aiming to shape, guide or affect the conduct of some person or persons” (Gordon, 1991, p. 2). Government is thus not reducible strictly to domination; instead, it comprises

those practices that try to shape, sculpt, mobilize and work through the choices, desires, aspirations, needs, wants and lifestyles of individuals and groups. This is a perspective

[...] that seeks to connect questions of government, politics and administration to the space of bodies, lives, selves and persons. (Dean, 1999, p. 12)

The “space of bodies, lives, selves and persons,” or a population, is a concept crucial to governmentality, as the objects of government are people and their practices, through both self- and other-regulation.

A population is constituted by a governing apparatus, which works by identifying a “population in need of calibration at the same time as it mobilizes that population to perform its own transformation” (Greene, 1999, p. 5) – often around some form of their practice, such as hygiene, reproduction, or consumer habits. Josh Gunn and I (2010) coined the term “gyniatric apparatus” to analyze advertising campaigns for three different menstruation-related drugs (Serafem, Seasonale, and Remifemin) that, we argued, together resulted in a “life-long project – from menarche through and beyond menopause” of medicalized self-surveillance and perpetual transformation (p. 113). As we will see, news media hail mothers as a population “in need of calibration” – one whose personal and familial safety has been compromised by terrorists and must therefore be recuperated; recalibration in this context appears possible only when mothers capitulate to the post-9/11 logic of security as the best means to protect their families.

In this view, a population transforms not because of overt manipulation but because of a perception that it is pursuing self-fulfillment by exercising freedom and choice (despite its choices being constrained within the bounds set by the very institutions that benefit from its actions) (Dean, 1999, p. 32; Graham, 1997). As Rose (1996) points out:

Contemporary practices of subjectification [...] put into play a being that must be attached to a project of identity, and to a secular project of “life-style,” in which life and its contingencies become meaningful to the extent that they can be construed as the product of personal choice. (p. 195)

Governing objectives guiding the Security Mom lifestyle are produced by interactions between numerous institutions: news organizations, TV networks, advertisers and marketers, think tanks, and political parties, all of which contribute to the discourse exhorting mothers to choose the Republican Party as a means of fostering both familial and national security. Nor are such appeals at all accidental; rather,

[i]t is the expertise of market research, of promotion and communication, underpinned by the knowledge and techniques of subjectivity, that provides the relays through which the aspirations of ministers, the ambitions of business, and the dreams of consumers achieve mutual translatability. (Rose 1996, p. 162)

The Security Mom brand embodies one such relay, and aligns neatly with the ministerial aspirations of the post-9/11 Bush White House, and the Departments of Defense and Homeland Security, as well as the business ambitions of corporate news

media outlets perpetually in search of affluent demographic groups to which to pitch their narratives and, most importantly, their sponsors' wares (Bagdikian, 2004; McChesney, 2008). Whether any consumers' dreams were realized as a result of the Security Mom brand's existence is less certain.

Arvidsson describes brands as "complexes of information that enter into the informational flows of daily life and direct and anticipate it in particular ways." Further, what makes consumer brands effective is also the case for identity brands like the Security Mom: "like many other forms of contemporary governance, [brands] rule through the freedom of its [*sic*] subjects, empowering them in particular directions" (2006, p. 127). As I will demonstrate below, news media constitute Security Moms as subjects whose political affiliations ebb and flow as domestic and geopolitical conditions change: when Bill Clinton was president, so-called Soccer Moms were represented as Democrat-voting liberals; after 9/11, their label changed to Security Moms, and they were cast as safety-obsessed Republicans (some newly so, having just abandoned the Democrats), voting to protect themselves and their families from terrorists. Even once this campaign was over, vestiges of this brand remain in public discourse (e.g., though not necessarily called out by name, Security Moms live on in Sarah Palin and the "Mama Grizzlies" she represented during the 2010 midterm election season).

The Politics of Motherhood in the Post-9/11 World

Two chief aspects of Security Moms highlight their brand as productive of governing and self-governing gendered conduct: first, their willing submission to patriarchal power, and, second, their intense fearfulness about terrorist attacks that, they assert, pose the greatest threat to the sanctity of their home and family.² The Security Mom brand maternalizes "power over life" as a governing apparatus that recalibrates Soccer Moms; by shifting their gender and electoral politics to the right, normalizing the militarization of their everyday lives, and performing propaganda, the Security Mom represents a media makeover and political transformation for this population. Using these elements, news media craft a brand identity that renders mothers as uniform supporters of President Bush, his administration's policies, the war, and the military, all in the name of security at home.

As a generic modifier, the term "security" denotes safety and comfort, but its use after September 11, 2001 obliquely calls up a construct that has become articulated to the US's anti-terrorism policies. That is, since the attacks on the United States that occurred on September, 11, 2001, "security" has become an enthusiastically utilized, yet vigorously contested, term that now connotes those activities begun by the Bush administration (and mostly continued by the Obama administration) as part of the "War on Terror": wiretapping; Internet and other digital surveillance; no-fly lists; preemptive war; and a heightened militarization of society, among others (Grewal,

2006; McLaren & Martin, 2004). As it is constructed in media texts, the Security Mom brand legitimates these measures and, by referencing the new brand's once-liberal Soccer Mom qualities, models how and why other concerned mothers might recalibrate their politics, too. This brand justifies patriarchal masculinity, sanctioning it as acceptable – even necessary – to make home and the homeland safe from external threats.

Time magazine's early coverage gave Security Moms their most visible debut. "Goodbye, Soccer Mom. Hello, Security Mom," the June 2, 2003 cover headline trumpeted, as the story inside presented the Soccer Mom as having "'morphed into Security Mom'" (Tumulty & Novak, 2003, p. 1). *Time*'s initial narrative sets the tone for subsequent treatments of Security Moms, which hew to the same formula and style of expression: using passive voice, reporters disavow any responsibility they or other journalists may have for constructing and propagating the identity while they simultaneously assign to it specific qualities, often relying on only the slimmest – or no – evidence:

Swing voters have always been elusive creatures, changing shape from election to election. The profile and assumptions about them in one contest seldom apply to the next one. This axiom is proving true again with that most-talked-about slice of American political demography: the Soccer Mom. Since 9/11, polls suggest she has morphed into Security Mom – and that development is frightening to Democrats, who have come to count on women to win elections. (Tumulty & Novak, 2003, p. 1)

Even while they claim no responsibility for its emergence, the reporters personify this alleged new bloc, ascribing qualities to its members and providing readers a sense of its members' politics:

She used to say she would never allow a gun in her house, but now she feels better if her airline pilot has one. She wanted a nuclear freeze in the 1980s and was a deficit hawk in the 1990s, but she now believes the Pentagon should have whatever it wants. Her civil liberties seem less important than they used to, especially compared with keeping her children safe. She's someone, in short, like Debbie Creighton, a 34-year-old Santee, Calif., mother of two who voted for Bill Clinton twice and used to choose the candidates who were most liberal on abortion and welfare. "Since 9/11," Creighton says, "all I want in a President is a person who is strong." (Tumulty & Novak, 2003, p. 1)

The Security Mom articulates the ideology of post-9/11 security and all it has come to encompass, to a gendered practice – being a good mother – in news coverage that draws from, deepens, and extends the historical experience and knowledge of that gendered practice. When media texts yoke "mom" to "security" during this tumultuous time in the United States, the historical specificity of both terms must be considered. Here "mom" reverts to a traditional, patriarchal motherhood: one that cedes responsibility for her safety and that of her family to a strong, male figure – President Bush – in the interest of their domestic security (see Faludi, 2007, for a book-length

analysis of the resurgence of intensely patriarchal protection narratives circulating since September 11, 2001). In the context of political news stories, “mom” naturalizes family and domestic caretaking responsibilities as those properly belonging to women, whose parental fears and concerns after the September 11 attacks are adroitly exploited in this discourse.

Conservative media commentator Michelle Malkin’s inflammatory manifesto in *USA Today* several days before the Democratic Party’s national convention in July 2004 fleshed out the Security Mom further:

I am what this year’s election pollsters call a “security mom.” I’m married with two young children. I own a gun. And I vote. Nothing matters more to me right now than the safety of my home and the survival of my homeland. I believe in the right to defend myself, and in America’s right to defend itself against its enemies. I am a citizen of the United States, not the United Nations. [...] What I want is a commander in chief who will stop pandering to political correctness and *People* magazine editors, and start pandering to me. (2004, p. 11A)

Malkin’s demand further set the tone for media coverage of Security Moms, who granted interviews to television programs, print media outlets, and radio news shows throughout the 2004 campaign season, when their votes were sought by Democrats and Republicans alike. Although Malkin’s extreme-right political position was not the only one these media Security Moms held, in television news it dominated and defined these mothers by virtue of the fact that more of them appeared to echo that position than any other (Malkin is, by her own account, a Soccer Mom too [Grewal, 2006, p. 32]). Malkin’s op-ed and reporters, too, thus reproduce the commonsense view that, *en masse*, these women had moved rightward on the political spectrum after the attacks of September 11, 2001, had disrupted their halcyon days as Democrats, when they could simply enjoy their children’s soccer games without fear.

The Security Mom’s nurturance is thoroughly steeped in militarism and pro-Iraq War sentiment, but by 2004, US voters were expressing increasing dissatisfaction with the Iraq War, particularly its seeming endlessness and ever-increasing casualty count (Harris & Muste, 2004, p. A4). The Security Mom brand thus legitimated unpopular Bush administration war policies by personifying support for them and then articulating that support to a group of mothers who, in recent history, had consistently supported Democratic – not Republican – presidential candidates (since the 1980s this gender gap has plagued Republican candidates; the 2004 election was no different [Gender Gap, 2004]). The Security Mom accomplished this in part by fusing maternal nurturance with the public and private logic of the post-9/11 security apparatus in the United States, and clearly expressing the belief that only George W. Bush could keep them safe.

As I noted earlier, Security Moms are likely the product of an Astroturf campaign – one designed to popularize policies that, at the time the brand emerged, were becoming deeply unpopular among the US public. Both the Center for Media and

Democracy's "Source Watch" and the Institute for Policy Studies' "Right Web" (both media source monitoring organizations) have revealed that the term "security mom" was created and spun by a group called Family Security Matters (FSM). FSM is a front group for the Center for Security Policy, a "hawkish security policy and think tank and advocacy group" that advocates US military interventions, such as attacking Iran as a means of achieving stability in the Middle East (Source Watch, 2008, p. 1). Soon after it was formed, FSM "claimed to represent 'security moms'" and acted to "communicate to American women what we need to know" (Source Watch, 2008, p. 1). The founder of FSM and its chief spokesperson is Carol Taber, who also sits on the board of the right-wing Independent Women's Forum (Right Web, n.d., p. 1). Another spokesperson for the group, Gay Bryant, describes FSM as a "non-profit, non-partisan communications initiative formed by a group of passionate women." Their role, she continues, is to "build grassroots efforts and resources for making the Security Moms' voice heard in the White House and on Capitol Hill" (Source Watch, 2008, pp. 1–2). So whereas her male counterpart, the NASCAR Dad, is both ideological and commercial (see Vavrus, 2007), the Security Mom's brand identity is much less a site for the showcasing of consumer commodities than a pitch for mothers to embrace Bush administration policies, politics, and propaganda – decidedly difficult to sell to people otherwise disinclined to support military expenditures and militarization (as Security Moms were said to be prior to September 11, 2001).

The brand also permits feminist politics (embodied by Debbie Creighton, among others) to be disarticulated from progressive second-wave goals of dismantling patriarchal laws and practices, and rearticulated to an ideology constituted of markedly patriarchal and militaristic policies and practices. Because Security Moms are former Soccer Moms (read: liberal), they lend credence to the notion that feminism and other liberal positions on issues are impractical and even dangerous after September 11. Ironically, their ability to be Soccer Moms at all is possible, as Grewal (2006) points out, only because successful feminist agitating to pass Title IX resulted in "a huge influx of girls and women into recreational activities as well as increased school and college athletic opportunities for them" (p. 33). Such a political erasure is a classically postfeminist denial of the importance of feminism in women's lives today, as is the accompanying expressed desire to be led by a "strong" and patriarchal male figure.

Thus (and not surprisingly given their hawkish think-tank origins), Security Moms in news media are shown as mostly white, mostly Republican, 18- to 49-year-old fiercely protective mothers living in traditional, nuclear family households. They are referred to as "target demographics," revealing their potential usefulness for marketing unpopular policies. Although a few Democratic and undecided Security Moms appear in news stories, they are far outnumbered by Republican women. Describing Security Moms, broadcast and cable news programs ascribe these qualities to them: "More than any single issue, security has defined that battle for women voters and has created a new swing group, the security mom" (Capus, 2004); "[c]oncern about terrorism and the safety of their young families has turned these soccer moms into security moms" (Cable News Network, 2004). What's more, Security Moms know

that “during crises [...] mommy issues often take a backseat to security” (Eldridge, 2003). “The women who are worried about the war in Iraq are worried about the safety of their own families. And they accept the idea that we are fighting over there to protect ourselves over here” (Fischer, 2004). They are “voting this year not only for a president but for peace of mind” (Capus, 2004). FSM’s Carol Taber defines Security Moms “both demographically and psychographically. Demographically she’s a woman with children in the household. [...] Psychographically, when they go to the polls, they have the A Number 1 concern, the safety and security of their children and they’re going to be voting on this issue” (Eldridge, 2004).

That the terms “demographic” and “psychographic” appear here suggests that the Security Mom’s greatest value lies in her ability to market a lifestyle to both women and news media outlets: one that reproduces and reinforces Bush administration claims about war and homeland security, and recapitulates planks in the 2004 Republican platform.³ Again a spokesperson for FSM, Carol Taber reported that her organization had conducted focus groups with undecided female voters. On the subject of the security of their families (which she claimed was their “A-number 1 concern”) she said,

President Bush scores very well here because they really do see him as a strong and resolute leader. But they don’t see the same thing in John Kerry. [...] Some women said about Mr. Kerry, I don’t trust him. Some said I don’t know what it is about him; I just don’t like him. Some women said he looked sneaky. [...] Some women said he’s too rich to be president. [...] they saw President Bush [...] as very strong, very consistent, and a defender of America and American families. (Eldridge, 2004)

Throughout Security Mom news coverage, commentators and guests present the act of acceding to President Bush’s benevolent patriarchy as both inevitable and desirable, as Bush is the most trust-inspiring presidential candidate featured in these news stories whereas John Kerry is viewed with suspicion. One Security Mom with a military husband, for example, told CNN that she thought President Bush was the candidate who would do the right thing by the armed forces. She said, “in my heart I know that President Bush is looking out for these guys. I mean, in his heart he’s doing what he thinks is best” (Cable News Network, 2004). Although she wasn’t referring specifically to Security Moms, Cynthia Enloe aptly explains the phenomenon voiced by these women: “[I]t is much easier to claim the authority to speak for others if one can claim to be The Protector; it is much easier to be silenced and to accept that silencing if one absorbs the self-identity of The Protected” (2007, p. 60). Although these Security Moms are not literally silent, they cede their right to vocalize criticism when they capitulate to the paternalism of the president, who by then had accumulated a long record of intolerance to criticism of his administration (McLaren & Martin, 2004).

In this discourse, George W. Bush emerges as The Protector and Good Father, the preferred alternative to John Kerry’s First Husband. But by also mixing incestuous

metaphors and using language such as “wooing” and “courting,” the same discourse presents both Bush *and* Kerry as suitors pursuing Security Moms as if they were potential romantic partners. For example, one Fox correspondent exclaimed that “the courtship is on” (Eldridge, 2003). And on *The Early Show*, a correspondent noted that both candidates appeared with their wives in televised interviews with Dr. Phil, an effort for President Bush to “win more women over” and for Senator Kerry to “try to win them back” (Neufeld, 2004). The gendered dimension of this coverage plays into traditional expectations about male protectiveness and female vulnerability that Faludi (2007) and Enloe (2007) argue have prevailed in public discourse since September 11, 2001; the attacks of that day and responses subsequent to them reactivated and intensified a narrative in which Security Moms play the part of women seeking protection from terrorists for themselves, their children, and their country.

Enloe’s term “militarized motherhood” (2000) describes the exploitation of mothers by warmakers eager to garner ideological and material support for the armed forces – a practice that goes as far back as the Revolutionary War. Militarized mothers aid in the process of recruiting bodies to fight wars because, despite military service being imbued with resonant symbols of masculinity and national pride, military recruitment is still a difficult business – particularly with an all-volunteer military attempting to win simultaneous wars in Afghanistan and Iraq (since 2004, the military has had problems meeting recruitment goals) (see Cooper & Jaffe, 2004; Moniz, 2005). Enloe argues that, historically, this situation invites “[r]ecruit-hungry government officials” to

wield more than the idea of masculinized, militarized citizenship. They have needed to craft and deploy a specially honed concept of motherhood. Designing militarized motherhood, however, also requires marginalizing or suppressing alternative notions of motherhood. (2000, p. 247)

Indeed, the 2004 Security Moms displace in news stories the once ubiquitous (and liberal) Soccer Moms, attempting to secure maternal allegiance both to the GOP and to the War on Terror. Security Moms perform as exemplary militarized mothers, exhibiting obedience to what the commander in chief asks of them and trust that he is doing what’s best for them, their loved ones, and their country. The contemporary militarized mother, however, is not asked to relinquish her children to the war effort; instead, individuals and groups ancillary to the military attempt to persuade her capitulation to the rationale underpinning the War on Terror and ideological support for the wars in Iraq and Afghanistan. It is worth noting that no Security Mom in these news stories raises questions about the wars or national security policy, despite the public’s increasing skepticism and doubt about both during this time.

With respect to their children, Security Moms appear neurotically fearful. One fretted that, “I watch my kids go to school and I hope they come back” (Capus, 2004). Another echoed her paranoia, “I don’t let my kids go anyplace. I’m – you know, we’re talking about going on vacation. Where can we go? How do we get through the

airport? How do – where is a safe place?” (Neufeld, 2004). Michelle Malkin’s manifesto included this confession that showcases not only her neurosis, but also her ability to echo a Bush administration talking point (Nichols & McChesney, 2005) to connect two figures – Osama bin Laden and Saddam Hussein – whose alleged collusion justified war on Iraq:

I make my husband take his cell phone with him everywhere – even on a quick milk run or on a walk to the community pool. We have educated our 4-year-old daughter about Osama bin Laden and Saddam Hussein. She knows that there are bad men in the world trying to kill Americans everywhere. [...] And at night we ask God to bless our troops as they risk their lives trying to kill the bad men before they kill us. (Malkin, 2004, p. 11A)

Security Moms thus legitimate a gated community mentality, justifying a divided society in which They (the “bad men”) are separated from Us (Americans and “our troops”), thereby minimizing the threat They pose to Us (Low, 2003, p. 139). Moreover, they set out the rationale for mothers – good mothers, that is – to deploy all those surveillance technologies marketed to quell the fears of anxious parents when they are away from their children. Katz (2001) refers to this as the “child protection industry” (p. 48), and notes that it is

part of the \$1.1 billion home surveillance industry brought about by the migration of spy technologies and logics across the domestic frontier. Its products enable parents to monitor from afar their children, childcare workers, and others interacting with their kids. (p. 48)

Security Moms voice fears that because even home is not a refuge from terrorists, mothers must be fully committed to taking every protective measure possible. Perhaps they will move to a gated community or introduce security technologies such as GPS devices in their children’s clothing (Goodman, 2007) or nanny cams (Rodino, 2005). To quell their fears, they expand their homes and childcare practices to include security technologies, thus increasing their own surveillance capabilities and optimizing their ability to protect their families. Further, these technologies potentially improve their capacity for biopower, for which they have been assigned responsibility by dint of being mothers. This news coverage thus has a dual propaganda function: to sell the so-called War on Terror and rationalize the defensive actions, services, and products perceived as necessary to metaphorically transform home into a modern fortress from which to guard against terrorists.

In addition to this performance, news media constitute Security Moms as a synecdoche for how “everything changed” for the United States after September 11, 2001; as such, they legitimate tactics used in the so-called War on Terror, including the War on Iraq and everything else falling under the sign of “security” at this historical moment. One reporter used an image evocative of the security checkpoints at airports to claim that Security Moms are on one side of a “security threshold” that

Democrats will have to “pass” before they could even hope to gain or regain Security Mom support (Guarino, 2003). During the 2006 Congressional election season, another Security Mom, this one a former co-director of the group “Security Moms for Bush,” asserts that

moms have a choice this November when they go into the voting booth. They can choose to vote for officials who have supported programs such as the NSA surveillance program, CIA detainee program or the PATRIOT Act – the programs which have made this country safe and not have an attack in five years – or they can vote for those who have sought to undermine or even rejoice when they killed those programs. (Fox Broadcasting Company, 2006)

That this Security Mom is open about her conservative political stance *and* appears on a Fox news program makes her statement predictable; what is less predictable is that this meme is woven throughout Security Mom discourse, even that emanating from purportedly nonpartisan outlets such as CBS, NBC, and PBS.

The Security Mom embodies attributes and beliefs that govern conduct by making controversial policies seem practical, rational, and sensible for women to embrace. Connecting a policy – or even a war – to maternal love justifies it, enhances its attractiveness, and dulls its controversies, which, in the case of war on Iraq, concern the grounds for conducting a preemptive war, the use of torture in interrogations, and the attempts to quash dissenting views on the war. For their potential to obscure these controversies or make them palatable, Security Moms in 2004 become part of the right’s strategy to eke out enough public support for an increasingly unpopular war to push President Bush to a second term. After the 2004 election, their reemergence in 2006, 2008, and again as Mama Grizzlies suggests a continuing need to buttress neoconservatism and cast in a positive light those Bush administration policies that have been subjected to public scrutiny and protest (e.g., the NSA’s wiretap program, to which the Security Mom above refers, was made public in December 2005 by James Risen and Eric Lichtblau of the *New York Times* – to widespread public dismay and White House chagrin). This is exemplified in a *CBS Evening News* segment on 2006 Security Moms, which introduces Julee Floyd – the main Security Mom in the piece – with this comment: “since September 11, there has been a serious side to almost every decision mom Julee makes.” Ms. Floyd elaborates: “I would say after 9/11, you know, there are all sorts of issues that you start thinking about. What if I was on that plane? What if I was on that building? What if my child ended up being in that building?” (Hartman, 2006). On *Fox News*, the former Security Mom for Bush co-captain ends her entreaty to voting mothers this way:

Look, moms have a choice: When they go to the voting booth they can choose to wake up in a country where they get up in the morning and worry about whether or not they are going to get their kids to school on time or wake up in a country like Israel, where it is a leap of faith to put their kids on the school bus every morning or take them to the pizza parlor or the mall. (Fox Broadcasting Company, 2006)

The rhetoric of choice imbues Security Moms' sentiments; in this example and elsewhere mothers can opt for the post-9/11 security state to protect children or risk the United States turning into a "country like Israel." Such a sentiment illustrates well the notion of governing conduct through choice and freedom, and it is not difficult to see that no real choice is being offered here: mothers must support the candidate and party promising to best protect their families. Rodino argues that this is how *matres bellicosae* have functioned historically, and that their contemporary incarnation as Security Moms "demonstrates the durability of maternal constructions that advocate destruction in the name of preservation" (Rodino, 2005, p. 383). Such is the paradox of the Security Mom: as she accepts war and the trappings of a security state to ensure that her children live safely, she consigns Iraqi children (and adults) to life in a war zone and all that entails.

Conclusion

The story of the Security Mom is a cautionary tale for news audiences, feminists, and anyone else concerned about achieving gender justice, for it plays a role in reproducing the (masculine) protector/(feminine) protected dichotomy that Enloe (2007) identifies. Such a dichotomy is fraught with problems, not the least of which is that the

protected's natural habitat is the domestic sphere – that is, the sphere of life where caring matters more than strategizing. Consequently, the protected is feminized insofar as the protected needs somebody who can think strategically and act in her (the protected's) best interests. (p. 61)

I would add that such a structure also vests protectors with exclusive rights to understanding national security matters, and therefore sole province over and responsibility for protecting mothers and their children – in this case, from terrorism.

Circulation of the Security Mom brand thus reproduces and rationalizes patriarchal "family values," pro-war propaganda, and maternal fearfulness that justifies Bush White House policies and politics. The corporate news media go along with assertions about Security Moms, never disclosing (and perhaps not knowing) that the source for this construction is a front group for a right-wing think tank, one that promotes Bush administration policies. The Security Mom is not the first example of a media construction being deployed to govern maternal conduct (see Douglas & Michaels, 2004, for many other examples); nor is it the only example of an attempt to militarize mothers, as Cynthia Enloe (2000) has shown. However, the Security Mom's politics of motherhood is taken up in news reports with such ease and credulity that this example should serve as a reminder to regard news constructions of motherhood with skepticism.

Such wholesale promotion of front groups' messages as news has become a common media practice, as investigative reporting budgets at many outlets have been cut to the bone if not eliminated entirely (McChesney, 2008; Potter, 2010). However, this should not excuse these outlets for being played in this way and, advertently or inadvertently, participating in the circulation of Bush administration propaganda to elicit from this target population "loyalty beyond reason." This brand is hardly a neutral description of a population's actions and beliefs; instead it accords with a controversial ideology and set of policies whose chances of acceptance by a dubious public may have benefited from being performed by mothers.

On the other hand, this case study also suggests that the maternal voting public is dubious about enlisting as Security Moms, despite Family Security Matters' best efforts to influence their hearts and minds. That is, although *news outlets* have uncritically adopted the Security Mom brand and constructed an intensive campaign around it, the women to whom this campaign was marketed appear to have been much less receptive to its claims and premises; in other words, this branding campaign was at least a partial failure. To reiterate note 3 below, Elder and Greene's election *post hoc* data analysis revealed that "[m]others, like women overall, were distinctive in being less supportive than men on most defense and war-related issues in 2004" (2007, p. 11). Their data show that the gender gap this campaign attempts to redress resisted think-tank machinations and instead remained about the same in 2004 as it had in prior election years. This is but one example from this time period that illustrates a stark difference between what the news media and the general public are willing to accept about rationales for war and national security policy. For example, while US news media beat the drums of war loudly and persistently in late 2002 and early 2003 (something that many reporters and even then Secretary of State Colin Powell have issued *post hoc* regrets about having supported [see Moyers, 2007]), protests *against* the United States going to war in Iraq erupted globally. After a weekend of such protests in February 2003, which brought hundreds of thousands of people into the streets, President Bush responded with the following: "Size of protest – it's like deciding, well, I'm going to decide policy based upon a focus group" (Purdum, 2003).

To dismiss the hundreds of thousands of people opposing war as a "focus group" expresses at the very least the anti-democratic sentiment that marked President Bush's two terms in office. But it also points to a perhaps unconscious gesture indicating the important role marketing and branding played in the Bush administration's attempts to sell the Iraq war as a product (Solomon, 2005, documents this in great detail). The Security Mom branding campaign fits in well with the larger Bush propaganda-marketing campaign, and further articulates consumerist notions of "freedom" and "choice" to war policy in an attempt to win public consent to fight a war large segments of the public opposed. Despite this brand's ultimate failure, we will doubtless witness other such attempts to exploit maternity and govern a population through bumper sticker slogans. If nothing else, this chapter suggests why we might want to look more closely at a bumper sticker with "mom" on it to discover who or what is sitting in its driver's seat.

NOTES

- 1 See Meehan (2005) for a discussion of the endurance of the metaphor of TV as a window on the world, and how TV industry economics render this view meaningless.
- 2 To be clear: I do not ascribe these qualities to women myself; rather, I provide examples from the news media's discourse about them to illustrate the assumptions conveyed about women labeled Security Moms and their political tendencies.
- 3 Political scientists Elder and Greene – who used National Election Study data from the 2004 campaign to investigate the Security Mom and NASCAR Dad constructions – conclude that there is “no support whatsoever for the idea of ‘Security Moms’” (2007, pp. 10–11). Moreover, their data show that, in 2004, women were significantly less likely than men to support increases in defense spending and spending on “the war on terror,” that women were less likely than men to think the Iraq War and the war in Afghanistan were worth it and less likely to think that the Bush administration had made the country more secure. Thus, the “Security Mom” label was not only inaccurate, it also misrepresented the position of mothers to some extent. Mothers, like women overall, were distinctive in being less supportive than men on most defense and war-related issues in 2004 (Elder & Greene, 2007, p. 11). Their study affirms the Security Mom brand's propaganda function: it attempts to mold and sculpt women's politics to adhere to Bush administration policies and the Republican National Committee's agenda as Bush (and Republicans before him since Ronald Reagan) faced the prospect of a large gender gap in the November 2004 election (Center for American Women and Politics, 2004). The fact that four years later, in 2008, these brand qualities and values could be condensed into one high-profile person – vice presidential candidate Sarah Palin, who would go on to almost single-handedly energize her party's conservative evangelical base – shows that the brand's value lay primarily in its ability to showcase and glorify the ideology of a party whose policies had grown unpopular (to say nothing of disastrous) over the preceding eight years of its dominance.

“Honey-Drenched, Rags to Riches, Good versus Evil Stories”

The Telenovela as a Cultural Referent in the US Press

Guillermo Avila-Saavedra

ABSTRACT

A telenovela is a Latin American form of serialized television melodrama. Until recently, telenovelas were only broadcast in the United States for Spanish-speaking audiences. This essay explores how mainstream American print media framed the telenovela genre in their coverage of four telenovela adaptations broadcast in English on My Network TV (a Fox-owned station) in 2006 and 2007. The analysis helps locate the coverage of the telenovela in a larger social and cultural context. Specifically, My Network TV's telenovelas suffered from an identity crisis. They were never embraced as telenovelas by the network, they were promoted as a new US genre, and their Latino identity was never explicit enough to be relevant.

Ever since the first Spanish-language television network, SIN (Spanish International Network), started broadcasting out of Texas, California, Florida, and New Jersey in 1961 (Veciana-Suárez, 1990), Spanish-speaking audiences in the United States have been watching telenovelas. In doing so, they have been keeping a tradition shared by millions of television viewers in Latin America. In fact, this form of serialized melodrama has been the cornerstone of Latin American television since the first television adaptations of radionovelas were made in Cuba in the 1950s and were quickly exported throughout the region (La Pastina, 2004). Over several decades, the telenovela became

a multibillion dollar industry reaching far beyond the borders of Latin America. Mexican, Venezuelan, Brazilian, and more recently Colombian telenovelas have been dubbed and successfully exported to Europe and Asia (Mato, 2005). The global success of telenovelas can be explained on multiple levels: the universality of melodrama, the familiarity of topics, and the appeal of serialized narratives. On the other hand, in the United States telenovelas have remained mostly the privilege of Latino households. However, even if mainstream US audiences are not aware of them, the United States has been host to an extraordinary evolution of the telenovela genre.

This evolution has taken place along with the development of Spanish-language broadcasting and the growing influence and presence of Latinos in the United States. Today, in fact, some of the most successful telenovelas are produced in Miami by a subsidiary of NBC with international casts and then sold around the world (Mato, 2005). According to Sinclair (2003), the telenovela industry in Miami is “a kind of cultural equivalent of the Hollywood film industry” (p. 212) that is becoming the essence of Latino media in the United States. Moreover, telenovelas are now being adapted for English-speaking audiences by mainstream networks.

This unprecedented form of cultural crossover is illustrative of the more influential role of Latinos in the United States. The interest in adapting telenovelas for mainstream viewers is indicative of the growing influence of Latinos as producers and consumers of media. One advertising industry report claimed that “births are outpacing immigration as the main source of Latino growth, and these US-born Latinos – already 60% of all Latinos – are less likely to speak Spanish as their primary language and are better educated, higher earners and more prone to marry outside their ethnic group than the immigrant generation that preceded them” (Navarro, 2006a, p. C4). If advertising money is any indication, media analysts predict that “as technology transforms media consumption into a pull mechanism with consumers in control, we will see an explosive growth and demand for Hispanic-oriented English-language media, in all forms” (Cartagena, 2006, p. S6). One of the first indications, the first bilingual television commercial in mainstream television, aired during the 2006 Super Bowl broadcast by Toyota (Ostrow, 2006). Telenovelas broadcast in English could appeal to millions of younger second- and third-generation Latinos, while introducing a new television genre for mainstream audiences at the same time. On the other hand, how telenovelas are adapted and received by English-speaking audiences may reflect the changing status of Latinos in mainstream US society. This essay examines the origin, generic structure, cultural relevance, critical and audience reception, and eventual cancellation of four telenovela adaptations broadcast on My Network TV (a Fox-owned station) in 2006 and 2007.

The Latin American Telenovela

Broadly defined, a telenovela is a Latin American form of serialized television melodrama that always comes to a narrative conclusion. Telenovelas air five nights a week

for an average of six months. This definition resists the temptation to compare telenovelas to US soap operas with their never-ending narrative arcs or to network television prime-time dramas, which air once a week and where returning seasons are dependent upon ratings. Beyond structural differences, a telenovela can be defined in stylistic terms as well; its melodramatic tone has come to be regarded as a distinctly Latin American aesthetic. Scholars discuss the role of the telenovela as an icon of cultural identity.

Roura (1993) labels the telenovela as “the empire of the domestic” (p. 37) and identifies particular elements that characterize the genre. Traditional telenovelas require an evil female character, an “Eve,” who is usually evil beyond rationality and comprehension. Her counterpart is a “Maria,” the good female character defined as “virginal, submissive, good, loyal, naïve, fragile, and incapable of the sexual act” (Roura, 1993, p. 62). Other important elements are the male protagonist, who is often the source of female antagonism, and a setting that displays luxury in order to highlight the class differences that often prevent the protagonists from being together. Gómez (1996) articulates the themes that constitute the genre. Happiness is difficult and does not come easily, good eventually overcomes evil, the role of destiny shifts from sadistic force to provider of happiness, and the value of marriage is confirmed as a sacred reward. An interesting element of Roura’s analysis is that she defines telenovelas as a pornographic genre. She argues telenovelas are gendered texts. Just like sexual pornography is designed to stimulate and release masculine fantasies, telenovelas are designed to satisfy women’s emotional needs. This explains their popularity beyond their original contexts of production and consumption.

Defining the boundaries of the genre can be problematic for telenovela research. Traditionally all telenovelas were constructed as love stories. These days, however, telenovelas can follow the adventures of a high school class or the successes of a fashion designer. According to Acosta-Alzuru (2003b), there are two broad categories of telenovelas: the telenovela *rosa*, which focuses on the romance and misfortunes of a heterosexual couple, and the telenovela *de ruptura*, which explores social issues perceived as problematic. Mandoki (2002) identifies 15 very specific categories of telenovelas, classified by age groups and topics, although she acknowledges that they often overlap. González (1992) argues that given the lack of a proper definition of the genre, each researcher has to articulate her own. This discussion is, however, purely academic. Audiences recognize a telenovela when they see one, based on its serialized format, the recurrence of actors, and the anticipated joyous conclusion.

La Pastina (2001) identifies cultural capital as a key variable in the process of interpretation among telenovela audiences in rural Brazil. In exploring the influence of telenovelas on the working class of Brazil, Vink (1988) discusses the telenovela as a social discourse where “the dominant and best formulated discourses are those on personal and private relations: gender, love, marriage, and family; discourses on social classes and their relations are secondary” (p. 181). Acosta-Alzuru (2003a) examines a Venezuelan telenovela whose producers refuse to label it as feminist despite its innovative way of portraying gender roles. She argues that even when more positive

gender portrayals are gaining a space, telenovelas still reinforce a notion of feminism as undesirable.

González (1992) points out the need for a cultural approach in telenovela research. He argues that although telenovelas are commercial products, their real significance lies in collective and cultural interpretation. Martín-Barbero (1993) highlights the economic relevance of the telenovela, linking its commercial and cultural environments. He argues that telenovelas, with their emphasis on the dramatic elements of perceived ordinary lives, constitute a cultural defense against the increasing commodification of life. Straubhaar (1984, 1991) highlights the role of the telenovela as a form of regional cultural expression that challenges notions of US cultural imperialism and promotes a Latin American identity. In that sense, telenovelas constitute a vehicle of regional cultural identity.

Telenovelas and Cultural Identity

As discussed in the previous section, telenovelas challenge notions of cultural imperialism from the North to the South. Telenovelas are exported as a Latin American genre, but little has been said about their national identities. La Pastina, Rego, and Straubhaar (2003) attempt a classification of telenovelas according to country of origin. Mexican productions tend to have little context; Colombian telenovelas are more comic and ironic; Venezuelan productions are more emotional; and Brazilian telenovelas are the most realistic with clearer temporal and spatial contextualizations. These authors argue that telenovelas are both entertainment and information because they are producers of cultural meaning and images congruent with social processes in Latin America. According to La Pastina and colleagues (2003), it is difficult to spot future trends in telenovela research as they become more and more globally interconnected with other forms of entertainment. They argue that telenovelas are evolving to a point of “continuous re-adaptation and integration within the urban landscape they have become symbolic of” (p. 5). In other words, they believe telenovelas have the potential to promote social change and future research should focus on how audiences incorporate these narratives into their daily lives.

Acosta-Alzuru (2003b) examines a number of nontraditional telenovelas dealing with issues such as sexual harassment, domestic abuse, abortion, and homosexuality. She argues that viewers only receive as acceptable telenovela narratives those issues that have long been part of an open public debate. Telenovelas cannot freely deal with issues that are perceived to be overly controversial and have not been extensively debated. Telenovelas constitute sites of mediation between production, reception, and culture. Understanding each instance of the culture circuit provides a clearer understanding of the production of meaning out of media texts. Each instance can be studied independently but is dependent on the others. As Acosta-Alzuru notes, “these articulations are underpinned by tensions between the commercial demands

of the genre (high ratings) and the creative-ideological demands of the author" (2003b, p. 212). In other words, production and consumption are interconnected.

In her analysis of three popular Mexican telenovelas, Beard (2003) argues that because of their popularity and media monopoly, telenovelas exercise great influence on the social construction of gender and the maintenance of cultural meaning in Mexico. According to Beard, despite their perceived differences in terms of content, style, and intent, Mexican telenovelas tend to reflect images of gender, sexuality, race, and class that validate the dominant system in force. For example, she notes that the only indigenous-looking characters in telenovelas tend to be maids and household help. In terms of gender, Beard argues that telenovelas reinforce "appropriate feminine" behaviors and support the idea that "only certain forms of female behavior and appearance, only certain gendered performances, are considered normal in society" (2003, p. 82). Finally, in terms of class, Beard argues telenovelas support a capitalistic economic model by constantly "blurring the lines between advertisement and entertainment" (2003, p. 86). It is interesting to note that, according to Beard, Televisa executives reject pushing a political agenda since the network envisions telenovelas as reflecting reality rather than as educational instruments.

Because telenovelas in Mexico dominate ratings and the networks' programming, González (1992) argues that it is essential to understand the relationship audiences establish with the programs; textual analysis of telenovelas is irrelevant and inconsequential. González focuses on how audiences use telenovelas. He argues, for example, that audiences find telenovelas helpful when solving problems on issues ranging from financial decisions to childrearing. Therefore, telenovelas perform cultural and educational functions beyond their mere aesthetic or entertainment value.

On the other hand, according to Mandoki (2002), research on audience reception often ignores telenovelas' aesthetic value. Their popularity in places as far as Russia and China suggests there is something universally meaningful about them. She argues that telenovelas "need no training for appreciation, and their aesthetic value is as obvious to its fans as it's negligible to its detractors" (2002, p. 183). Mandoki wants to understand what kinds of relations are established between telenovelas and their audiences, and she concludes that telenovelas are "far from the sublime and close to the ordinary" (2002, p. 208) but have the potential to reflect situations that are relevant for their audiences and therefore an important field for exploring media's social and cultural influence.

The work of other scholars ties telenovelas' commercial logics of production with their cultural logics of consumption. Martín-Barbero (1993) argues that telenovelas are significant subjects of analysis because of their economic relevance for Latin American media industries and because of their "modeling presence" of social customs and values. He argues that the commercial success of telenovelas in Latin America is a consequence of Latin American societies' struggle between increasing commodification and loss of the melodramatic aspects of traditional culture. Telenovelas constitute a sort of weapon in this struggle. They are a defense strategy against the commodification of daily life and against the loss of identity.

Tufte (2000) argues that telenovelas are globally the most successful genre of television fiction. Through an ethnographic approach to the reception of a particular telenovela in different parts of Brazil, he argues that audiences' interpretation is the result of a negotiation between direct readings of the telenovela text and audiences' particular situations. Tufte also argues that the economic and cultural conditions in Brazil are best represented as a hybrid between tradition and modernity. Telenovelas exemplify this inherent contradiction that is part of Latin Americans' daily lives. Also in the context of Brazil, Vink (1988) examines the incredible popularity of the genre. According to Vink, telenovela narratives emphasize the characters' romantic lives and family situations, while ignoring most of the social and economic contexts where they take place. He argues that in Brazilian telenovelas, when the narrative touches on socioeconomic issues, the discourse of class is morally charged with a critical view of the upper class and an idealized view of the working class. Vink concludes that by presenting the lower economic classes as a sort of ethical ideal, telenovelas have limited capacity to promote social change.

An element of telenovela research that remains insufficiently examined relates to the reception of these programs outside of Latin America. In exploring the reception of telenovelas among Latinos in the United States, Barrera and Bielby (2001) define five specific cultural functions that telenovelas perform for Latinos in the United States: (1) recreating Latino culture; (2) providing familiar narratives; (3) offering an opportunity to hear the native language; (4) portraying more traditional gender roles that are more consistent with Latino culture and hard to find on mainstream Anglo television; and (5) providing a representation of extended families that is valued by Latinos in the United States. Barrera and Bielby conclude that telenovela audiences in the United States gain much more than entertainment; telenovelas are instrumental in "recreating and maintaining a strong cultural bond to Latin America" (2001, p. 13). However, the telenovelas included in their research are Latin American productions aired on US-based Spanish-language networks. The English-language telenovela, intended for both English-speaking Latinos and mainstream audiences, is a recent, completely unprecedented development. An understanding of telenovelas' ability to transfer across geographical and cultural borders is relevant to the core of this analysis.

International Telenovela Flow

Latin American telenovelas can be discussed as a form of resistance against cultural imperialism from US media. Due to their global popularity and economic success, telenovelas in fact represent a contra-flow media form, a concept that explains how cultural production is not limited to flow from rich to poor countries but is rather a two-way street. For example, more than half of the Eastern European television channels have Latin American telenovelas in their programming (Biltreyst & Meers,

2000), and one of the main producers in the region, Brazil's Red Globo, exports telenovelas to more than 128 countries (La Pastina, 2004). Beyond cultural and historical comparisons, the ground for Latin American telenovelas' success is economic; telenovelas are relatively inexpensive to produce compared to other foreign media products. Biltereyst and Meers believe that Latin American telenovelas should be seen as equal players in the globalized media market. Media conglomerates such as Televisa in Mexico, Red Globo in Brazil, or Venevision in Venezuela should not be considered different from US-based media corporations. According to Biltereyst and Meers, Latin American telenovela producers have clear commercial strategies by responding to an increased demand for cheap television programming. Therefore, efforts to replicate the success of telenovelas in countries outside of Latin America are tied to the telenovela's ability to provide inexpensive programming that attracts large audiences.

Examining telenovelas' global appeal, La Pastina and Straubhaar (2005) argue that audiences approach media texts based on cultural proximity, defined in both geographic and linguistic terms. On the other hand, the global appeal of telenovelas beyond Latin American relative cultural homogeneity can be explained from multiple levels: the universality of melodrama, the familiarity of topics, and the cultural, historical, and linguistic similarities in Latin America (La Pastina & Straubhaar, 2005). However, telenovelas are cultural texts and their ability to transfer across borders, without substantial adaptation, is limited. Arguably, the extreme success of telenovelas in their domestic markets can only be replicated by reproducing the genre in the specific social and cultural contexts where the television text would be consumed. That would be the commercial rationale behind the US-produced, English-language telenovela.

Mato (2002, 2005) argues that the big production centers, such as Mexico, Brazil, and Venezuela, have resisted a complete cultural homogenization of their telenovelas. When distributing telenovelas in Latin America, producers still face resistance to local accents and national references. According to Mato, "the city of Miami has become consolidated as a 'territorial' point of reference for the transnationalization of [the telenovela] industry" (2002, p. 195). Miami-based telenovelas, with multinational casts and lack of specific references, appear as culturally neutral productions. Mato argues that in the context of media globalization, Miami can become the center of production of a homogenized Latin American telenovela industry. Ever since NBC purchased Telemundo in 2002 (James, 2007), the Miami-based telenovela has been replacing Latin American productions as the main source of telenovelas for Latinos in the United States. This development can also be considered the immediate precedent to the US-produced, English-language telenovela.

Despite the fact that millions of people in the United States regularly follow telenovelas, and the documented stylistic and aesthetic influence of telenovelas on US soap operas (Bielby & Harrington, 2005), until recently the telenovela genre had seldom been covered by the mainstream press. A simple LexisNexis search for the term "telenovela" in major national newspapers reveals how the number of stories

jumped to 589 in 2006 from 106 in 2005 and 149 in 2004. This sudden burst of journalistic attention was not of course gratuitous. It responded to the announcement by all the major networks of plans to adapt and develop telenovelas for mainstream, English-speaking audiences, and it took momentum with the launching of a new television network wholly devoted, at least initially, to the idea of the English-language telenovela.

My Network TV

In 2006, the invasion of the telenovela in US television seemed imminent. Several English-language telenovela plans were announced and reported in the press (Albiniak, 2006). Mexican actress Salma Hayek reached an agreement with ABC to adapt the widely successful Colombian telenovela *Yo soy Betty la fea* (I'm Betty, The Ugly) for mainstream audiences; the show, *Ugly Betty*, premiered in September 2006. Latina television producer Nely Galán was reportedly working on an adaptation of the novel *The Dirty Girls Social Club* by Latina author Alisa Valdes-Rodríguez as a telenovela for Lifetime (Huff, 2005). Another Latina television executive, Nina Tessler, was quoted several times working on telenovela adaptations for CBS (Fernández, 2006). However, it was a new network, born of a melodramatic, telenovela-esque saga of corporate mergers and acquisitions, that finally gave the green light to the first truly US-produced, English-language telenovelas.

In the first half of 2006, CBS Corporation and Warner Bros. decided to merge their struggling networks, UPN and WB respectively. Both UPN and WB had been created in recent years in order to target a younger, more racially diverse demographic, and both had independently delivered mediocre results to their parent companies. The result of the merger was the CW television network. Local affiliates that signed with the new network acquired the new logo and corporate image as well as the most successful programming from the deceased networks, including *America's Next Top Model*, *Smallville*, and *Everybody Hates Chris*. However, a problem arose in those markets where both UPN and WB had local affiliates. Suddenly there were local stations without network affiliation and without programming. The solution came from Fox (Bauder, 2006; James, 2006).

Because of different agreements, purchases, and mergers, the Fox network already owned several UPN local affiliates. Fox immediately announced the creation of a new network, My Network TV, to supply programming and support to all the local stations left without network affiliation after the UPN–WB merger, and hopefully to more local stations around the country. In that sense, My Network TV is innovative; it is a hybrid between a traditional network and a syndication company. For example, WPHL in Philadelphia is now called MyPHL17 and borrows the logo and image of My Network TV, while WHP in Harrisburg is still a CBS affiliate that happens to buy some of its programming from My Network TV. This identity crisis is just one of the confusing aspects of My Network TV and might explain the lack of an “About

Us” link on the company’s website. Fox announced the launching of My Network TV for September 5, 2006. Fox also announced that the cornerstone of its programming would be prime-time daily dramas with 13-week narrative arcs. The network did not publicize the fact that the scripts had been adapted from successful Latin American telenovelas. In fact, the network did not hire writers but “translators who condense and convert old telenovela scripts from Spanish to English” (Bianco, 2006a, p. E3). As far as identification is concerned, some network executives called the new shows “short dramatic series” (Elliott, 2006b). Others in the press called them really long miniseries; nobody from the network called them telenovelas, even though that is clearly what they are. Just as clear was Fox’s intention to create a new network in order to lure a particular demographic, since “telenovelas broadcast in English could appeal to millions of younger second- and third-generation Latinos who speak English more frequently than Spanish” (Elliott, 2006a). My Network TV’s offering consisted of four one-hour shows that ran in pairs between September and December 2006 and between December 2006 and March 2007 and that eventually failed to deliver the expected ratings. The shows were *Desire*; *Fashion House*; *Wicked*, *Wicked Games*; and *Watch Over Me*. This essay explores how mainstream print media framed the telenovela genre in their coverage of these telenovela adaptations. This discourse analysis helps locate the failure of these shows in a larger social and cultural context.

Methodology

Although similar in some fundamental elements, discourse analysis is more complex than content, narrative, or rhetorical analyses because it emphasizes not only the meaning of the text but also the social construction of meaning through the text (Acosta-Alzuru & Lester-Roushazamir, 2000). Therefore, language is analyzed in light of the social positions of the speakers and the relationship of power between them. MacMillan (2006) defines discourse analysis as the “broad area of language study, containing a diversity of approaches [...] and very different methodologies” to investigate the social use of language (p. 1). According to van Dijk (2001), the fundamental nature of discourse analysis is “understanding the nature of power and dominance and how discourse contributes to their production” (p. 301). Van Dijk (2001) argues that ideologies play a vital role in discourse analysis since ideologies function as interpretative frameworks that determine social attitudes and beliefs (Dellinger, 1995). Therefore, van Dijk envisions language and discourse in the same way as Stuart Hall and other cultural and media scholars envision media texts. The political, economic, social, and cultural contexts where discourse is produced and consumed are fundamental for understanding the relationship between language and power. An approach to discourse analysis that emphasizes and exposes the relationships among texts, ideologies, and cultural power has been favored by a poststructuralist, cultural studies-oriented branch of media studies. According to Fairclough

(1992), the relevance of discourse analysis is “showing how discourse is shaped by relations of power and ideologies, and the constructive effects discourse has upon social identities, social relations and systems of knowledge and belief” (p. 12). He argues that discourse analysis should consider ideas and values that are both present and absent in the text.

In media studies, discourse analysis requires multiple in-depth readings of the text subject of analysis, identification of themes and categories, and the establishment of relationships between themes and the broader social and cultural contexts where the media text takes place. When analyzing media texts, the focus of discourse analysis is on social conditions and how media language legitimates social control and allocates cultural power (MacMillan, 2006). According to Fairclough (1995), media discourse should be placed in the “wider cultural context of detraditionalization and informalization which are profoundly changing traditional constructions and conceptions of self-identity” (p. 73). Discourse analysis of mediated texts is useful to reveal the larger dynamics behind the production of those texts. Acosta-Alzuru and Lester-Roushanzamir (2000) define discourse as “a system of representation in which shared meanings are produced and exchanged; discourse emphasizes relations of power while also attending to relations of meanings and the process of production and exchange are therefore ‘materialized’ within the text” (p. 307). They apply discourse analysis to their examination of the social and political dimensions of journalistic coverage during wartime, while Gavrilos (2002) applies discourse analysis to understand how news media represent and construct an ethnic community in the United States.

Analysis of the press coverage of television programs is relevant to understand the social and cultural contexts of production and reception. According to Mittell (2001), the examination of television genres requires a discursive approach that considers the different dimensions where television texts take place. Television analysis, Mittell notes,

[s]hould gather as many enunciations of the genre from the widest possible range of sources, including corporate documents, press reviews and commentaries, trade journal accounts, other media representations and the texts themselves. Linking together these numerous discourses will begin to suggest more large-scale patterns of generic definitions, meanings and hierarchies. (2001, p. 4)

Through analysis of the mainstream press coverage of each of these telenovela adaptations, this essay examines the social and cultural discursive connections around the telenovela genre present in the United States today. Discourse analysis is useful because, as stated above, it emphasizes not only the meaning of the text but also the social construction of meaning through the text (Acosta-Alzuru & Lester-Roushanzamir, 2000). The analysis focuses on the extent, tone, and intent of coverage of the telenovelas, not only as a new television genre but also as a cultural product of Latin American origin. The press articles analyzed come from six prominent

newspapers (*New York Times*, *Washington Post*, *USA Today*, *Los Angeles Times*, *Tampa Tribune*, and *Houston Chronicle*), one media-related popular magazine (*Entertainment Weekly*), and one trade publication (*Broadcasting and Cable*). The newspapers were chosen either due to their national relevance or because they represent a geographic area in the country where Latinos are more numerous. All of the articles were obtained from the Lexis-Nexis database. The time frame studied ran from August 1, 2005 (shortly before the start of the 2005–2006 television season) to May 15, 2007. The search terms included “telenovela,” “my network TV,” and the program titles. Additional background and contextual information was gleaned from the network’s website descriptions of the plots and characters, weekly 10-minute recap videos posted on the network’s websites, and my own nonsystematic viewing of the programs and familiarity with some of the original Spanish-language productions.

Desire

Initially, My Network TV had announced that all their shows would take the umbrella title of *Desire*. Eventually, however, they decided to identify only their 8 to 9 p.m. show with that name. *Desire* is an adaptation of the successful Colombian telenovela *Mesa para tres* (Table for Three), produced by Caracol TV in 2004. Although several changes were made to adapt the story to the US context, the basic plot is quite simple and remains the same. Two brothers, on the run from the mob, hide in a new town and become restaurateurs; the real drama begins when they realize they are in love with the same woman (*Desire*, 2006). Even though *Desire*, being a new experiment for the network, benefits from a smaller budget than comparable prime-time shows, it is undeniable that the US adaptation has much higher production values than the Colombian original.

The adaptation of the script tends toward “Americanizing” the characters rather than the plot. The show’s director, Alex Wright, is quoted as saying that “generally Americans have less body language than Colombians do, so we have less of that; throwing your hands up in the air and saying ‘Dios mío,’ all that stuff is out” (Navarro, 2006b). However, regardless of how mainstream the characters appear, taken out of their Colombian context some elements of the plot (e.g., Colombian drug lords become New Jersey Italian mobsters; the social and cultural oddness in the United States of grown men’s extreme closeness to their mothers) seem particularly alien to US social and cultural contexts. The show performed poorly for the network; the debut obtained a 1.0 rating and the remaining episodes averaged a 0.4 rating in the key 18–49 demographic (Benson, 2006). It is never explicitly stated but the network’s intention to attract the Latino audience is obvious given the casting decisions; therefore, opportunities to draw cultural references abound. Latinos would not only be attracted presumably by the genre and plot, but they would find familiar faces among the actors as well. Tomy Dunster, who plays George Marston in the show, has appeared in the Argentinian telenovela *Rebelde way* (Rebel’s Way) and the

Mexican telenovela *Mientras haya vida* (As Long as there's Life). Eliana Alexander, who plays the brothers' mother Rita Thomas, appeared in the Miami-based, Spanish-language network Telemundo production *La ley del silencio* (The Law of Silence), broadcast in the United States and throughout Latin America in 2005.

Fashion House

The 9 to 10 p.m. timeslot in the network's initial offering was occupied by *Fashion House*, an adaptation of the Cuban telenovela *Salir de noche* (Going Out at Night), produced by ICRT (Instituto Cubano de Radio y Televisión). The plot revolves around the hostile takeover of a fashion company by two competing industry tycoons whose families and histories are dramatically intertwined (Fashion House, 2006). *Fashion House* was the network's safest bet due to its two big, if somewhat forgotten, stars. Bo Derek and Morgan Fairchild portray the two rival fashion gurus and there is more than enough fighting and screaming between them. As suggested by television critics (Bianco, 2006b; Shattuck, 2006), for mainstream US audiences this fictional relationship would be strongly reminiscent of that played out by Joan Collins and Linda Evans in *Dynasty* throughout the 1980s. Latino audiences, however, would also recall other memorable strong female leads in famed Latin American telenovelas, such as Lupita Ferrer's role in the 1985 Venezuelan telenovela *Cristal* (Crystal), produced by Radio Caracas Televisión, which was also set in the fashion world. Furthermore, the feisty heroine who is not afraid to throw a tantrum has had multiple incarnations in Latin American telenovelas, from 1983's *La fiera* (The Fiery One) to 1987's *Rosa salvaje* (Wild Rose) and 1985's *Las Amazonas* (The Amazons). As noted earlier, telenovelas are designed to satisfy women's emotional needs (Roura, 1993), so overly dramatic, emotional female characters are recurring elements of Latin melodrama, from Mexican telenovelas to Almodóvar's award-winning films. In *Fashion House*, Cuban American actress Natalie Martínez, as the frustrated fashion designer Michelle Miller, also adds to the Latino flair. *Fashion House* performed only slightly better than *Desire*, averaging a 0.6 rating throughout the show's 13-week run (Benson, 2006).

Wicked, Wicked Games

Even if publicly disappointed by its first shows' performance, My Network TV, and implicitly Fox, bet on a second two-show round of English-language telenovelas from December 2006 to March 2007. The 8 to 9 p.m. timeslot of the second offering was occupied by *Wicked, Wicked Games*, an adaptation of the 1998 Venezuelan telenovela *Aunque me cueste la vida* (Though It Might Cost Me My Life), produced by RCTV (Radio Caracas Televisión). The plot is a story of revenge. A woman (played by Tatum O'Neal) is rejected by the object of her infatuation; she returns 25 years later,

rich, beautiful, and powerful, to take revenge. She plans to use her innocent twin sons to seduce the daughters of her former lover and take control of his possessions. Her plans fall apart as the youngsters fall genuinely in love (*Wicked, Wicked Games*, 2006). This is the one show that lacked explicit Latino appeal. None of the cast members is Latino and the business-like setting feels alien to the core of the story. In fact, some stylistic elements of the plot were severely toned down for mainstream audiences. In the original telenovela, the story of revenge took place in a context of magic spells and gypsy curses, elements that are completely absent in the US version. However, these changes work against the adaptation since such a wicked thirst for revenge, witch-like laughs and evil stares included, appears disproportionate in the context of profit margins and stock values provided by the show. *Wicked, Wicked Games* performed just as disappointingly as the previous shows, averaging a 0.7 rating throughout its run (Benson, 2006).

Watch Over Me

The 9 to 10 p.m. timeslot in the second round of English-language telenovelas was taken by *Watch Over Me*, an adaptation of the Argentinian telenovela *Resistiré* (I Will Resist), produced by Telefe in 2003. In 2006, Televisa produced its own adaptation for the Mexican market titled *Amar sin limites* (To Love without Limits). The plot is a love triangle. Julia (Dayanara Torres), “an alluring graduate student and rare beauty” (*Watch Over Me*, 2006), is engaged to a wealthy man involved in criminal activities that she ignores. Julia falls unexpectedly in love with a poor but honest man. Because of her engagement, she struggles to keep her feelings secret until the true nature of her fiancé is revealed. Of all the My Network TV shows, *Watch Over Me* has the most explicit Latino appeal. Dayanara Torres might appear as a newcomer to mainstream US audiences, but US Latinos would remember her as the 1993 Miss Universe from Puerto Rico who went on to star in multiple telenovelas and married and divorced singer Marc Anthony. Furthermore, her character, Julia Rivera, is clearly identified as Latina while both her love interests are Anglo men. The Latina/ Anglo love ensemble has been a rare occurrence on mainstream television. In addition, Julia’s openly gay brother Ryan was played by Omar Avila, who was recently seen by Latino audiences in the 2005 Venezuelan telenovela *Soñar no cuesta nada* (*It Doesn’t Cost Anything to Dream*), produced by Venevisión and broadcast in the United States on the Spanish-language network Univision. Colombian-born actress Catalina Rodríguez and Mexican American actor Tony Castillo also had recurring roles in the show. However, *Watch Over Me* performed just as poorly as its predecessors and its final episode marked, at least for the time being, the end of telenovelas as the cornerstone of My Network TV’s programming.

On March 1, 2007, just days before the final episodes of *Wicked, Wicked Games* and *Watch Over Me*, My Network TV announced it was abandoning the telenovela format. The shows were replaced by two weekly serialized dramas, *American Heiress* and

Saints & Sinners, and the rest of the programming schedule was filled with movies and sports shows. In February 2009 My Network TV announced it was moving from a network model into a hybrid programming service (Malone, 2009). Under this model, My Network TV provides only limited prime-time programming to its affiliates, which need to turn to syndication services to fill their schedules. Currently the network offers no original fictional programming. The consequences of the failure of My Network TV's English-language telenovelas are significant. In a media market where more and more networks and cable channels compete for the same advertising money, other networks are unlikely to repeat the telenovela experiment. Furthermore, even if these telenovela adaptations were not explicitly targeted to Latinos, the alleged influence of bilingual Latinos as a media audience is now questionable. The failure of a new television genre takes on social and cultural dimensions.

The mainstream press followed the birth, troubled life, and apparent demise of the English-language telenovela with much interest. The importation and adaptation of television genres or programs is not necessarily big news. Adaptations of reality television shows like *Big Brother* and *American Idol* as well as of comedies like *The Office* and dramas like *Queer as Folk* have made their way from Europe without much fanfare. After all, Europe has always been a cultural referent in the United States, and audiences are not likely to even be aware of the precedence of television concepts. That is certainly not the case for the importation of telenovelas from the South because it represents a little reminder that cultural currents actually run both ways. Therefore, the idea of a US-produced, English-language telenovela is not something that goes easily unnoticed for critics or audiences. According to González (1992), telenovelas require no definition since Latin American audiences recognize one when they see one. Mainstream audiences, however, are not familiar with telenovelas, and the proper introduction of a new idea always requires a definition. Like any media text, telenovelas constitute sites of mediation between production, reception, and culture. Therefore, the style and tone chosen by the mainstream press to define the telenovela for the greater public are illustrative of their approach to the whole collection of people, cultural meanings, and social conventions that the idea of an English-language telenovela represents. Based on a discourse analysis of mainstream US press coverage of these programs, I have identified the following themes: (1) a devaluing of the telenovela genre and (2) the use of the telenovela as a cultural proxy for Latinos.

Devaluing the Telenovela Genre

Definitions of the telenovela found in the press are relevant precisely because they are not academic definitions. Arguably, television critics in newspapers and magazines exercise more influence on the public's appreciation of the new genre than culture and media scholars. Interestingly enough, in the US mainstream press telenovelas are defined either in reference to or in opposition to soap operas and recent serialized

prime-time dramas. Even though “any channel surfer can see that Latino prime-time dramas have more oomph than that yanqui ‘Days of Our Lives’ fuss” (de la Torre, 2005), most critics find the telenovela/soap opera reference useful. Therefore, in the words of newspaper television critics, telenovelas can simply be “melodramatic soap operas that are hugely popular on Spanish-language networks” (Levin & Bianco, 2006) or, more explicitly, “telenovelas are melodramatic, episodic TV programs, broadcast in Spanish, that combine elements of soap operas, mini-series and serialized shows like ‘Dynasty’ and ‘Desperate Housewives’” (Elliott, 2006a). In obvious and sarcastic reference to some less than memorable television shows, an *Entertainment Weekly* television critic thinks of telenovelas as “Aaron Spelling suders on speed” (Bierly, 2006). (Spelling was the producer of such 1980s prime-time soap operas as *Melrose Place* and *Beverly Hills, 90210*.) An interesting aspect of this approach to defining telenovelas is that it does not acknowledge telenovelas’ influence on recent serialized television programming in the United States. *Desperate Housewives* is an obvious reference to define telenovelas precisely because the show, and other recent serialized programs, borrows heavily from the Latin American genre and not the other way around (Thottam, 2006).

When it comes to style and aesthetics, some definitions border on offensive while somehow remaining just playful. In such cases, telenovelas are “saucy, spicy, campy soap operas” (McDaniel, 2005) or “sex-drenched stories centered on impossible love affairs, implacable enemies and insoluble family problems” (Elliott, 2006a, p. C6). Although similar notions of the genre have long been held by Latin American scholars and critics, in the context of the US mainstream press they take on a different connotation. By obvious association, they reinforce stereotypes of Latinos as overly sexual, overly emotional, family-centered people. Saucy and spicy are not necessarily bad characteristics, but they tend to portray Latinos as one-dimensional and predictable.

Culturally sensitive approaches tend to be the exception and are mostly found in the *New York Times* and the *Washington Post*. Other sources’ definitions can take a very negative tone. Again, it is worth considering that these definitions are more than media reviews, they are also harsh evaluations of a foreign culture. It is only the fact that they are dealing with television shows that frees these critics from the political correctness of US journalism. Very condescendingly, a telenovela can be described as “a steamy low-budget soap opera genre that has become the staple of television programming in Spanish-speaking countries” (Carter, 2006), “over the top and unintentionally comedic,” “produced dirt-cheap” (Levin, 2006, p. 1D), as simple as “honey-drenched, rags to riches, good versus evil stories” (Porter, 2005, p. AR1), and consist of “heaving bosoms, breathless dialogues and betrayal” (Whoriskey, 2006, p. A1). A devastating definition describes the “classic conventions of the genre” as follows:

Scenes are videotaped; unhappy couples consult priests as well as therapists; men and women alike weep big, glistening glycerin tears of rage and sorrow; the maid wears a starched apron and uniform; the villain cackles; and the music is as exaggeratedly melodramatic and campy as a soap opera parody on “The Carol Burnett Show.” (Stanley, 2006, p. E3)

This expert assessment suggests not only a lifetime of telenovela watching, but also an absoluteness that finds nothing salvageable in telenovelas, not even the campiness others celebrate. If telenovelas are no better than parodies of soap operas, an already underappreciated genre, the obvious question is why would anyone want to reproduce such bad television in the United States? Starting with this rhetorical question as an assumption, it is fair to say that journalistic assessment of My Network TV and the first English-language telenovelas was hardly objective. With an average circulation of 2.3 million and claiming more than 4.3 million readers (*USA Today*, 2007), *USA Today* is the nation's top-selling newspaper. Given its wide reach and presumed lack of regional flavor, arguably *USA Today* represents the average, mainstream cultural taste of people in the United States. Therefore, the assessment of the newspaper's media critic, Robert Bianco, is particularly relevant. Bianco is at best skeptical of the English-language telenovela:

We can debate forever whether there's a prime-time audience for telenovelas in English. (Isn't part of their appeal to a Spanish-speaking audience precisely the fact that they're in Spanish?) Even so, in the countries where the genre is big, one assumes the shows are able to attract correspondingly big talent. Here not so much. (2006b, p. 3D)

At worst, he appears derisive. Speaking about the translation of telenovela scripts into English, Bianco notes, "one can only hope the scripts have lost something in the translation – though my guess is they would be awful in everything from English to Esperanto," and then concludes, "think of the most incompetent soap opera you've ever seen, imagine something even worse, and there you have My Network TV" (2006a, p. E3). At least from the perspective of *USA Today*, which echoes throughout coverage from other sources, the failure of the network seems to have been both expected and desired.

The Telenovela as Cultural Proxy

Some television critics attempt a more sophisticated approach and try to locate telenovelas within a cultural and social context. Navarro, of the *New York Times*, explains that for US Latinos telenovelas "function like a kind of cultural touchstone" and that even bilingual Latinos follow them because they show "a Hispanic presence not found in most English-language programming" (2005, p. AR1). Telenovelas are part of a Latino heritage. Sometimes critics define telenovelas not by comparing them to soap operas but by their unique characteristics. They quote network executives praising telenovelas' "rich cinematic look" (Elliott, 2006b, p. C8) and "crazy, fun, dramatic and melodramatic" narratives (Bierly, 2006). Navarro concludes, rather ominously, that "the genre is so distinctive that some say it is better left alone" (2006b). However,

even culturally aware critics work with a rather limited definition of the telenovela, and a variation of the genre that is very popular and deals with historical and political issues is never commented on.

Even if assuming that media critics cannot greatly influence the tastes or media consumption of US audiences, their opinions are still relevant. Media critics represent the voice of the mainstream press, an important social institution. Arguably, critics do not approach a media text in isolation, but rather within a social and cultural context. Television critics found problems in almost every aspect of the telenovelas, from the music – “this Americanized melodrama is underscored – but mainly undermined – by mournful pop tunes” (Stanley, 2006) – to the production values, evidently inferior to other network prime-time dramas (Cridlin, 2006). Even the name chosen for the network created suspicion (really a spinoff of another Fox-related venture, the My Space website). Some wondered if the name was too explicitly Latino, given the tendency to use the possessive to signal that something is meant for exclusive consumption by US Latinos, as in “tu canal” or “nuestro canal” (“your station” or “our station”) often seen in Spanish-language television stations. The obvious implication, even before the shows premiered, is that mainstream audiences will feel alienated. The fear of Latino influence is also evidenced by the use of Spanish in several of the shows’ reviews, for example: “it will be *muy interesante* to see whether this import will prove mainstream enough [and can] deliver *la pasión* in English” (Treviño, 2006, p. 11A). Arguably, such use of Spanish highlights the foreign nature of telenovelas with an emphasis on cultural stereotypes.

However, most critics took issue, perhaps rightly so, with the shows’ poor writing and acting. Speaking of the shows’ supposed cliffhangers, Bianco (2006c) comments: “Can you stand the suspense? Yeah, odds are you can” (p. 10D). On the other hand, even critics who tried to explain the failure of US-produced, English-language telenovelas by the inability of the network to respect the essence of the genre in the adaptation process end up, perhaps unconsciously, undermining the genre itself. Stanley notes:

“Desire” and “Fashion House” try to follow their Spanish-language models more faithfully and falter. If nothing else, they prove that some things are good because they are bad. These seek to freshen the Latin prototype with more expensive cinematography and hipper music and are, of course, much worse. Imitation may be the sincerest form of flattery, but sincere imitation is downright insulting. (2006, p. E3)

The argument here is multifold. Media reviews are critical of these adaptations for being poorly made, but they are also critical of the telenovela genre in general. More importantly, by constantly highlighting the telenovela origin and popularity in Latin America, arguably media critics in the mainstream press are critical of the discerning taste of Latinos as a cultural group.

Discussion

In the introduction to her latest book, *Once upon a Quinceañera: Coming of Age in the USA*, author and essayist Julia Alvarez (2007) answers the question, what exactly is a quinceañera?, by saying, “the question might soon be rhetorical in our quickly Latinoizing American culture” (p. 2). Arguably, the same can be said about telenovelas. The question, what exactly is a telenovela?, might soon be a rhetorical one. If only for that reason, the recent inauspicious foray into the English-language telenovela has had profound implications. An important element of Latino culture is becoming common cultural currency in mainstream US society. On the other hand, the failure of My Network TV’s telenovelas is disquieting on its own merits.

An advertising executive quoted in the *Los Angeles Times* on the potential of English-language telenovelas states that “everyone is curious to see how this will play out; it defies all the conventions that make network television work” (James, 2006). She goes on to consider whether audiences would rather see “more sophisticated narratives.” It is fair to say that the My Network TV telenovela adaptations were clumsily done, poorly acted, and insufficiently promoted, which at least partly explains the overwhelmingly negative reviews they received in the press. Furthermore, the programs’ failure might be the result of some self-fulfilling prophecy of low expectations. Supposedly excited about the new shows, even network executives cannot help conceal their condescension toward the genre. Bob Cook, president of Twentieth Television, a division of Fox in charge of the telenovelas’ production, is quoted as saying that “there are some very popular telenovelas that we did not option; the reason is because they were too corny, too over-the-top, too overstated and didn’t adapt well to American sensibilities” (Bauder, 2006, p. 6). One wonders if the same contempt for television audiences in Latin America tainted the network’s evaluation of the particular US demographic they were trying to attract. Arguably, the network based its bet not on the genre’s strengths but on a perceived lack of sophistication on the part of the audience. Audiences did well, then, by responding less than enthusiastically.

In light of all the evidence, are we supposed to conclude that over the span of a few months we have witnessed the rise and fall of the US-produced, English-language telenovela? Other evidence suggests a more nuanced evaluation. My Network TV is a new network, with limited budgets, a handful of local affiliates, and no name recognition in an already cluttered media landscape. It does not seem fair to lay the blame for the failure entirely on the genre or the concept. Another interesting piece of evidence has to do with regional differences in audience reception. According to Hibberd (2006), the shows performed a lot better in New York, averaging ratings of 1.8, than in California, where shows averaged an almost invisible 0.2 rating. This information raises important questions about the cultural tastes and social dynamics in different parts of the country. Answers to these questions might suggest a better

timing and more effective promotion strategies for future English-language telenovela projects.

Besides its commercial failure, the English-language telenovela, as adapted by My Network TV, also failed to engage in a discussion about the status of Latinos in US society. These telenovelas failed to create a direct connection with Latino audiences while attracting mainstream audiences at the same time. They failed to raise important social and political issues about Latinos and did not produce iconic or memorable media images for US Latinos. In terms of the hybridization of US television, these telenovelas failed to show the potential of Latin American genres. Arguably, these English-language telenovelas were mere translations with only superficial nods at cultural adaptation. In summary, My Network TV's telenovelas suffered from an identity crisis. They were never embraced as telenovelas by the network, they were promoted as a new US genre, and their Latino identity was never explicit enough to be relevant. On the other hand, another recent and more critically and commercially successful hybrid show such as *Ugly Betty* on ABC (another telenovela adaptation) may be a better reflection of the aesthetic and cultural influence that Latin American genres may exercise on US television. Cultural hybridization has little to do with imposing cultural products "as is," but a lot to do with borrowing, adding, mixing, and blending. These new shows stress the need for and point in the direction of further research of hybrid US Latino television programming. This kind of scholarship is clearly relevant, given the growing influence of US Latinos as producers and consumers of media, and the inherent power of television to symbolically articulate negotiations for social and cultural power.

Changes in the News Representation of Minorities Over the Course of 40 Years of Research

Eli Avraham

ABSTRACT

Much attention has been given by media researchers to the news representation of minorities over the last four decades. Numerous studies over the years have shown that the coverage of minorities in the news is rife with negative stereotypes and generalizations. This chapter aims to discuss major issues and questions raised by analyzing trends in 40 years of studies of news representation of minorities. These include: What is the image of minorities in the news? Why is the news coverage of marginal groups so biased and which factors explain their coverage patterns? How and why has the image of minorities changed over the years? Which theories and research methods were used in order to analyze the news representation of minorities? And how do the leaders of minority groups and regulators work to change the negative stereotypes and the problematic images of minority groups in the news?

Much scholarly and public attention has been devoted to the news representation of minorities and socially marginal groups over the last four decades. Numerous studies over the years have shown that the coverage of minority and marginal groups in the news is rife with negative stereotypes and generalizations. Just as directors, producers, casting people, and advertisers have “reserved” certain problematic roles for

minorities in movies, TV series, and advertisements, journalists and news editors have tended to associate members of minority groups primarily with negative events, behaviors, and topics such as crime, poverty, and disorder. Nevertheless, although the image of minorities and marginal groups is still problematic, several researchers claim that during the last two decades positive changes have occurred in the image of certain groups (Avraham & First, 2010b; Wolfsfeld, 1997).

Grounded in the concern that negative media images result in negative public perceptions, in recent decades minority group activists have been working to challenge media stereotypes and to improve the portrayals/coverage of their groups. In addition, during recent decades regulators – primarily in various European countries – have begun to take steps to promote less stereotyped representation of minority groups, and to encourage a fairer reflection of cultural diversity in the national media, either by legislation or by benefits and incentives for media franchisees, editors, and producers (ter Wal, 2002).

By analyzing trends in 40 years of studies of news representation of minorities, the goal of this chapter is to discuss five major questions: (1) What is the image of minorities in the news? (2) Why is the news coverage of marginal groups biased, and which factors explain their coverage patterns? (3) How and why has the image of minorities in the news changed over the years? (4) Which theories and research methods were used in order to analyze the news representation of minorities? (5) How do the leaders of minority groups, nongovernmental organizations (NGOs), social change organizations, and regulators work to change the negative stereotypes and the problematic image of minority groups in the news? While diversity can be defined in various ways – race, ethnicity, class, gender, religion, nationality, sexuality, and so on – in this chapter I would like to concentrate on social/national/racial/ethnic minorities. This is not to imply that the study of news representations of other marginal groups is not warranted, but rather that space limitations for this project preclude being more inclusive.

Representation and Shaping Our Perception of the World

Over the years, scholars have studied the media's power and effect on the social, political, economic, and cultural spheres. For example, Hoare (1991) argues that newspapers' mass circulation makes them a powerful, aggressive agent, and that they translate this power into decisions regarding what to cover (or not to cover), what significance will be given to various stories, and what will be the direction or judgment of the events. Other scholars have argued that journalists' influence lies in their role as "gatekeepers" who have the power to decide what events become news, thereby determining what the public will read, hear, or see (Shoemaker, 1991; Tuchman, 1978; Walmsley, 1982). Whatever the case may be, it is a well-established

fact that the media construct our reality regarding the events happening around us (Adoni & Mane, 1984; Avraham, 2003; Cohen & Young, 1981; Weimann, 2000).

The media provide us with “social knowledge” about our world; they paint our social and cultural landscape in a way that serves as a basis for the formation of personal identity and the distinction between us and others (Jakubowicz, Goodall, Marin, Mitchell, Randall, & Seneviratne, 1994). The belief that media images can shape our perception of reality and our behavior is one of the main reasons why so many activists, scholars, spokespeople, and researchers focus their attention on media images and call for changes in media representation of certain groups.

According to Tuchman (1978), news is socially constructed through well-recognized frameworks that are influenced by the routines through which reporters gather, filter, and judge information, a fact that has been documented by numerous other scholars (e.g., Avraham, 2003; Crane, 1994; Shoemaker & Reese, 1991). News production is not merely a process of gathering information, writing, editing, and reporting on major events and different groups (van Dijk, 1988a). Cultural, social, economic, and professional constraints affect the news production process (Hackett, 1984; Hall, 1977; Tuchman, 1978; van Dijk, 1988b). Therefore, at the base of the social construction of reality lies the claim that the news is not an objective means of *portraying* reality, but rather a means of *constructing* reality (Tuchman, 1978). The news production process creates a singular version of “reality” through the amplification, sensationalization, and polarization of ideas and images within a limited, well-defined range (Waitt, 1995). The news creates and reinforces labels for groups, places, events, and situations (Avraham, 2000, 2003; Davis, 1990; Wolfsfeld, Avraham, & Aburaiya, 2000).

News content reinforces existing attitudes toward and beliefs about groups, places, and issues in three ways: selective exposure, selective perception, and selective memory. When an individual has little or no real-world contact with the members of another social group, the media provide basic information that constructs that group’s stereotype and image (Dahlgren & Chakrapani, 1982; Gold, 1994). The images of groups, places, and issues are based on knowledge, and the more knowledge a person has, the more accurate his or her perception of the group, place, or issue generally will be (Gold, 1994; Kariel & Rosenvall, 1978). The media dependency hypothesis predicts that the media’s influence on perceptions of social reality decreases when a person has personal experience related to the covered phenomenon (Perry, 1987). An individual learns through the media what significance he or she should ascribe to different groups, places, and issues with which he or she has no contact. It is because of this power, Walmsley (1982) believes, that the media are an effective instrument of social control.

Representation of Minorities in the News

Numerous studies have shown that the coverage of minority and marginal groups in the media is problematic. These studies, conducted mainly in the United States

and Europe, have proven time and again that the representation of these groups in advertising, news, film, and television has been meager, and that when they have been covered, many have been marginalized and stereotyped (Avraham et al., 2000; Downing & Husband, 2005; Lahav & Avraham, 2008). Van Dijk (1996) argues that the news plays a major role in the creation of ethnic relations. He believes that journalists present ethnic groups as “them,” and thus define those who belong to the collective and those who do not (Lundby, 1992). Jakubowicz and colleagues (1994) argue that “othering” certain groups and creating the image of the “other” as a threat allows “us” to determine what “we” are not.

Researchers who have studied the news coverage of minority groups have found that in most instances there has been a tendency to ignore minority groups or to portray them negatively – what has been called “symbolic annihilation” (Tuchman, 1978). Such coverage implies that the “other” represents a threat to social order. In addition, implicit in this coverage is the notion that minorities are to blame for society’s economic and social maladies, which are a result of the fact that “they” are different from “us.” The description, coverage, and portrayal of the “other” in the news, whether based upon religious, national, ethnic, or other differences, is attended in many countries by the widespread use of generalizations, stereotypes, and prejudices. Ignored are the background, causes, and social-political context that have led to the difficulties and crises involving minorities in many areas (Avraham, 2003; Avraham & First, 2010b; Downing & Husband, 2005; First, 2002; Jakubowicz et al., 1994).

Research has shown that leaders of many social groups are disturbed by their group’s news image (Avraham, 2003), but the question remains how we can analyze and compare the coverage patterns of minorities. Several researchers have made considerable contributions to the study of coverage of groups. Among them are Strauss (1961) and Gould and White (1986), who argue that the news image of a group can be examined only by means of comparison with that of other groups. Comparisons of different groups are based on quantitative measures (more, less) or on criteria for the contrast between or the similarity of the groups compared. When the metaphor used is “development,” groups are described in the context of the point they have reached in the life cycle. “They” are more (or less) modern, more (or less) settled, more (or less) advanced than “we” are. Thus, the ways in which the news chooses to cover certain groups can lead to the formation of “us” and “them” identifications (Anderson, 1988; Avraham, 2000; van Dijk, 1988a). As a result, “proof” of the developmental levels of different groups is provided by the selection of events that receive coverage (Avraham, 2003; Dahlgren & Chakrapani, 1982; Strauss, 1961).

“Symbol,” “stereotype,” “label,” and “reputation” are the main concepts used when examining group image in the news media. When a group is labeled as one in which certain types of events and activities occur, it becomes a “symbol” of these activities. As a result, other events related to the social group are not covered (Shields, 1992). Strauss (1961) defines this phenomenon as “reputation” and argues that the tendency to speak stereotypically of social groups persists so that even if changes in the real-life situation of these groups occur, they are not reflected in the media

coverage patterns (Elizur, 1994; Graber, 1989). Shields (1992) adds that the myth created regarding a certain group can persist for years, whether it is favorable or not. For example, Burgess (1982) notes that local municipal leaders in northern England believe they must still combat stereotypes persisting from the nineteenth century concerning their way of life. As soon as events are covered that serve to describe certain groups' behavior patterns, their image is created accordingly.

According to Epstein (1973), editors' and reporters' stereotypes become self-perpetuating when their past experiences influence their choice of future stories to cover. Relph (1976) claimed that images of groups in the news are transferred through what he called "opinion makers" and distributed by journalists via use of stereotypes. Usually the news reflects stereotypes that already exist in society and the public, while giving them much broader distribution and a means of continuity from generation to generation (Gans, 1979; Gould & White, 1986; Pike, 1981). Elizur (1994) commented that the centrality of television in our lives during the previous decades increased the creation of stereotypes of groups, places, and subjects covered. Stereotypes and distortions result when television news covers crises in which minorities are involved through short, highly superficial reports that lack both background and commentary.

Theory and Methodology in Research of News Representation of Minorities

Studies that focus on news images of minorities have employed several theories – with or without the aid of conceptual approaches such as ideological critique, feminism, semiotics, and psychoanalytic theory – and research methods. Here, first, I would like to concentrate on three central theories: representation and media frames (both of which are linked to the social construction of reality attitude), and organizational theory; second, I would like to briefly discuss research methods used by researchers in the field.

Representation Theory

One of the main theories used by researchers in order to conduct studies dealing with the image of minorities is representation theory. In the beginning of this research the term "representation" was mostly used to signal the presence or absence of people of color in the media, or constructive versus unconstructive portrayals (Downing & Husband, 2005). Later, however, Hall (1997, p. 15) asserted that representation means "using language to say something meaningful about, or to represent, the world meaningfully, to 'Other' people." According to Hall, "representation is an essential part of a process by which meaning is produced and exchanged between

members of a culture” (Hall, 1997, p. 15). At the core of representation theory lies the constructionist approach, which is derived from the phenomenological approach and serves as its point of departure. This theory is influenced by the input of social-political reality, symbolic reality, and the interaction between them. Representation is considered as both a process of ongoing construction of identities in any given culture and a stereotyping force (van Dijk, 1996). Stereotyping “reduce[s] people to a few, simple, essential characteristics, which are represented as fixed by nature” (Hall, 1997, p. 257). Thus, stereotyping fixes differences. Moreover, stereotyping deploys a strategy of “splitting”: it separates the normal and acceptable from the abnormal, and then excludes or expels what does not fit or is different. Because it tends to occur in situations involving power inequities (Dyer, 1993; Hall, 1997), stereotyping as a classification system serves to maintain the social and symbolic order.

At least three dimensions are relevant when examining a group’s place in any given society. The first dimension is the very existence of the group in the media; due to society’s power hierarchy, media access is not available to weak groups (First, 2002; van Dijk, 1996). Empirical examinations of a group’s presence in media content, or a “head count” (Greenberg & Brand, 1994), is used to study the representation of “the other.” A second dimension is the quality of how a group is represented in the media. Researchers analyze variables such as the professional-social role that the “others” play in texts, the subjects to which they are connected, the contexts in which they appear, and so forth (First, 2002; Greenberg & Brand, 1994). A third dimension is the reciprocal relationship between members of the majority and minority groups. In news programs and talk shows, for instance, this relationship is measured by examining the characteristics of the journalists, moderators, and commentators, and their relationships with members of various groups (Avraham, 2003; Avraham & First, 2010a).

Symbolic annihilation (Tuchman, 1978), another angle of representation measurement, is divided into quantitative and qualitative indicators (Kama, 2002). While the quantitative aspect is similar to the “head count” approach, the qualitative one refers to the role of the “other.” Yet this category is incomplete without the added element of identity. According to this approach, the identity of any individual is her/his biography (name, age, residence, occupation, title, and so forth); a deprivation of one’s biography amounts to objectification (First, 1998). Finally, the interaction between members of majority and minority groups may operate through two mechanisms: inclusion and exclusion, as discussed below. Beyond the question of whether the characters that belong to different social groups appear in broadcasts, it is also imperative to relate to the quality of the characters’ representation, the way they appear, and the context in which they appear (Greenberg & Brand, 1994).

Media Frames

As with representation theory, at the core of media framing theory lies the constructionist approach, which is derived from the phenomenological approach and serves as their point of origin. Both theories are influenced by the input of social-political reality

as well as symbolic reality and the interaction between the two. Moreover, framing specifically is the outcome of modes of representation, and vice versa. Both theories are fundamental parts of a process whereby meaning is produced and exchanged between members of a culture in these two realities. Despite the two theories' similar origins, the research dealing with representation has focused until now primarily upon the coverage patterns of minorities and marginal groups in media content. Research on framing, on the other hand, lately relates more to organizational levels (Avraham, 2003; Avraham & First, 2010b; Wolfsfeld, 1997; Wolfsfeld et al., 2000).

The discussion of media frames constitutes the link between various fields of research regarding representation, or, in other words, between processes and products, because a dialectical relationship exists between the two. While different definitions of media frames exist (e.g., Gamson, 1989; Gitlin, 1980), all suggest that framing involves the placing of "facts" or components perceived as "reality" inside frames that provide coherence, through a causal explanation, a moral statement, or a recommendation for a solution. A media frame can be identified through journalists' use of metaphors, key sentences, and symbolic verbal and graphic means, with various people and interest groups constantly battling for control over media frames most suitable to their needs. According to Liebes (1997), framing includes the following mechanisms: excising, sanitizing, equalizing, personalizing, demonizing, and contextualizing.

The media carry out their role as ideological instruments by shaping, distributing, and reproducing the limits of legitimate discourse. News people make use of available framing mechanisms and social-cultural codes to turn uncommon, extraordinary events into understandable media events (Gitlin, 1980). Media organizations are constantly involved within a changing social-political environment, making representation a dynamic process. In this environment, cultural suppositions regarding society's central values influence journalists' work patterns, news production processes, and the end result (First, 2002; Gitlin, 1980; Herzog & Shamir, 1994). Journalists thus prefer stories that are recognized as efficient and receive professional approval, as well as stories that are culturally acceptable. Editors are influenced by the perceptions they hold of their target audience, and they tend to believe that the majority group has little interest in minorities unless their actions might interfere with the majority's day-to-day life (First, 2002). Wolfsfeld and colleagues (2000), for example, show how the annual protest day observed by some Arabs in Israel was framed in the Hebrew national media as a threat under the "law and order" frame. This is a classic example that illustrates the effect of journalists on the interpretation of events and the construction of reality. Reporters and editors could easily have framed the events as a request for equality, but instead chose to frame them in a negative way.

Organizational Theory

One of the key concepts to understand how media outlets construct representation of different groups is "access." Barzel (1976) defines this term as the freedom of a non-media-related person to reach the media. In other words, how easy is it for any

individual in society to make his/her opinions or actions public knowledge through the media? Barzel argues that it is a media employee who decides who will be granted this access, and that this decision is dependent on external and internal factors (Avraham, 2003). In other words, media decision-makers such as editors, journalists, producers, and TV anchors facilitate access for some groups, offering them presence and extensive, favorable coverage, thus legitimating their status and power. Other groups are not given access; these same groups also receive little attention in social life (van Dijk, 1996). Therefore, people who do not belong to the elites or to powerful social groups are the subjects of news coverage only when they are involved in political activities or become victims of disaster or crime. Issues and players on the national news scene reflect a country's power and control structure (Avraham, 2003; van Dijk, 1996).

Organizational theory emphasizes the role of the media organization as a central component of the media process that is influenced by various factors and constraints shaping its image and work routines. In order to better understand this role, the whole news production process is analyzed. During this process, one can see how professional and cultural assumptions are "translated" into news production conventions that affect the image of different groups. The daily race for stories and sources, along with the fact that reporters and editors usually work under severe time constraints, does not enable newspeople to think about the political and social consequences of their actions. Decisions regarding coverage patterns are made automatically and are based on news construction routines. The use of the term "construction" indicates that news stories are produced within a certain narrative frame that places events in specific social, economic, and political contexts.

Research Methods

Studies that have analyzed news images of minorities have used diverse research methods over the years. These studies have moved from news coverage patterns analysis to organizational research and lately also to policy analysis. Studies on news coverage patterns mainly used qualitative and quantitative content analysis, while organizational studies used in-depth interviews of journalists and leaders of minority groups, concentrating on analyzing the media routines and their effect on social groups' news images. In the next stage we find studies that measure the effect of regulatory policy on the image of social groups. Although qualitative and quantitative analyses are still popular among researchers, organization and policy analyses focus on the reasons for the problematic news representation and steps made to improve it. It appears that a combination of several research methods might lead to a better understanding of social groups' media images and the factors behind them.

Content Analysis

The research methods, as mentioned by Downing and Husband (2005), that have been applied to content analysis range from the heavily quantitative to the strictly

qualitative. In other words, there are two dimensions to deal with news coverage patterns of social groups: nature and quantity (Avraham, 2003; Manheim & Albritton, 1984). The quantity dimension refers to the amount and visibility of coverage the group receives in the news media. Factors examined include details such as the number of reports or photos of the group, on what page or in which section the articles appear, the article's size (in the press) or the length of the report (in TV news), and so forth. But we know that it is not only the amount of media coverage that is important, so too is its quality. This aspect is illustrated in the second dimension, the nature of the media coverage, which refers to several factors: which subjects are most frequently covered from the social group (such as crime, poverty, social and community events, culture, sports, or violence); the ways the social group is described in the reports; who is represented as being responsible for the events that are covered; who is quoted and who is the source of the information reported; what is the tone of the stories, media frame, or photo captions (Avraham, 2000; Dominick, 1977; Graber, 1989; Larson, 1984; White, 2006). In this dimension the studies that treat the nature of coverage "beyond the numbers" apply a "qualitative analysis" approach. This body of research focuses on more subtle levels in which the spirit behind each news item or article is monitored. Such studies look for stereotypes, generalizations, and myths that appear in the coverage of certain social groups, and embrace a more general theme regarding the social group's identity (Avraham, 2003; Shields, 1992; van Dijk, 1988b). Examples of such statements are: "This group does not consider education as an important means for a better life" or "the group members are frequently involved in crimes and illegal events." Because of the powerful effect of statements like these, many researchers try to locate and reveal such themes. This analysis is also called "quality content analysis" or "symptomatic reading"; it is also used by researchers who conduct policy analysis in their search for means and methods used by regulators to improve the media image of social groups. Here one can find analysis of regulators' decisions, steps to promote fair representation, policies adapted, and their effects.

In-Depth Interviews

While in-depth interviews as a methodology cannot study content itself, it can study the factors influencing the content that is produced. The semi-standardized in-depth interview is a research method characterized by a number of core questions that serve as the foundation for all interviews conducted (McCracken, 1988). As applied to the study of news coverage of minority groups, the aim of these interviews is to learn as much as possible about the norms, beliefs, sources, and assumptions governing the actions of journalists during the news production (Gans, 1979). Interviews are unique because they provide detailed information about the reasons an interviewee made certain decisions or wrote an article in a certain way. The information gathered from interviewees reveals routines, organizational dynamics, opinions, values, motives, experiences, and emotions (Wimmer & Dominick, 1991). Reporters are usually asked about their primary sources of information, their relationships with

decision-makers and group leaders, the types of stories they believe their editors and their readers prefer, and their process of socialization within the media organization. Editors are usually asked about newspaper policies on certain issues, the types of events they define as “news,” and the ways in which they explain what news stories they prefer. Leaders of social groups are usually asked about their relationships with reporters and editors, their access to the media and why they find it important, their methods of delivering messages to the media, the types of stories they believe the media prefer, their understanding of the “rules of the game” with regard to associating with the media, and their willingness to allot funds and resources to the establishment of marketing programs and public relations campaigns.

Reasons for the Problematic Image of Minority Groups

In order to understand how and who constructs the representation of minorities in the media, it is imperative to examine the factors responsible for their problematic image. In my book on the image of marginal groups in the Israeli media (Avraham, 2003), I present a dynamic model: “An integrated model of factors constructing coverage patterns of social groups and places in the news media.” According to this model, the factors that affect the image of minorities are: (1) the social group’s characteristics (population size, geographic location, crime rate, and socioeconomic indicators); (2) editorial policy and social-ideological distance between the news team and social groups; (3) social-political environment; and (4) the social group’s public relations. Because of space limitations, this chapter will concentrate on the last three factors.

It seems that the best way to understand how different factors construct the news image of minorities is by means of an example: analysis of coverage patterns of social groups in the national press. The three social groups in question are located in Israel’s geographic periphery: inhabitants of development towns (Jews who immigrated to Israel from Arab countries), Arab Israelis living in Israel, and Jewish settlers living in the occupied territories. The national newspapers’ editorial boards are located in central Israel (Tel Aviv) and groups in the periphery are usually covered by regional correspondents. According to Avraham (2003), over the 40 years examined by the study, members of these groups were described in a stereotyped manner; they were often the subject of unsubstantiated claims and writers used generalizations and “us” versus “them” language, for example:

- **“The national-religious settlement community is being shaped as a separate socioeconomic entity.** To call it a parasitic entity would be harsh. But what do

these protests create in six days of work? **What, if any, is their contribution to the livelihood of the Israeli people**, not only to their spiritual power – that is a legitimate question” (*Ha’aretz*, July 13, 1993).

- “**Most [settlers] do not ‘create’ anything**, but are employed in the bureaucratic system established in their residencies or drive to work daily in Israel” (*Ha’aretz*, January 1, 1998).
- “The people of *Netzer Hazzanii* [Jewish settlement in the West Bank] **do not believe in peace**” (*Ha’aretz*, November 13, 1992).
- “A week before the Levi affair, Bet-She’an [a northern development town] was shocked by another event. [...] **Although the answer is known to the whole of Bet-She’an...**” (*Yedioth Aharonoth*, June 14, 1991).
- “Lottery fever raged among residents of Sederot [a southern development town] yesterday [...] **they all think about one thing: the dream of getting rich the fast way** [...] people are filling out lottery forms like madmen” (*Yedioth Aharonoth*, May 12, 1992).

In the last two examples we can see how journalists used generalizations to describe a social group by implying that the group members think and react in the same way. Other generalizations have been made about the cultural features of Arabs, as shown in the following examples:

- “*Tamra* is one of the largest villages, **but not one of the most educated ones**” (*Ha’aretz*, May 30, 1985).
- “As far as the social-economic aspect is concerned, this Arab village is an exception [...] **although it is a Muslim village**, *Jatt* has a long tradition of education” (*Ha’aretz*, September 8, 1987).

Many news stories emphasize the “otherness” of these groups. Residents of development towns are referred to, sometimes literally, as different from the “common Israeli.” The following excerpt expresses the difference using a biological metaphor:

- “In fact, one may ask if the development towns have grown a special human species of people, **different than the species ‘common Israeli’**” (*Ha’aretz*, January 12, 1990).

The lack of self-consciousness with which the question is raised of similarity or difference between residents of development towns and the “common Israeli” is surprising. Conspicuously absent is a discussion of who defines “who is an Israeli” and who is the “common Israeli” – is it a resident of a development town or of a city in central Israel, a settler, an Arab, or an ultra-Orthodox Jew? There are other strategies used to clearly delineate between the “first Israel” and the “other Israel.”

Editorial Policy and Social-Ideological Distance between Journalists and Social Groups

Many researchers have explained coverage patterns of social groups according to the proximity of group members to the journalists and editors covering the groups (Gamson & Wolfsfeld, 1993; Jakubowicz et al., 1994; van Dijk, 1996). Decisions on defining the target audience, the news definition of a social group, and the allocation of reporters are mostly determined by social-ideological proximity. Group members who are socially and ideologically similar to journalists will be considered part of the target audience, their news definition will be positive, and one or more reporters will be allocated to cover them on a regular basis. Such proximity can be based on ethnic, racial, or religious identity. For example, in the study on the Israeli media mentioned above, I found that places and groups considered to be in close social-ideological proximity to the media's decision-makers received wide and positive coverage (Avraham, 2003). The reverse was also found to be true: groups that were considered distant from the media decision-makers received scant or negative coverage.

One of the most important elements to examine when looking at issues of proximity of this type is the ethnic origin of the journalists (Adams, 1986). Van Dijk (1988b, 1996) maintains that in Western countries, White journalists work within the dominant ethnic consensus, and this is reflected in the media content/journalist discourse when they cover places comprised primarily of minorities. This discourse creates a distinction between "us" and "them," using labels, stereotypes, and prejudice (Fair, 1993). It can be anticipated that journalists of color would cover such places differently because of their familiarity with the culture, resulting in less stereotyping and prejudice. For example, Wolfsfeld and colleagues (2000) found that the coverage patterns of demonstrations in Israeli Arab cities were affected by the fact that these cities were covered by Jewish journalists and editors (Avraham, 2003; Avraham & First, 2010b).

Socio-Political Environment

By "socio-political environment" I mean the context in which the media operate and interact with different actors. Journalists and editors always operate within a certain sociopolitical context that affects the ways they collect information and report events. This context encompasses the central values of their society, the political culture, and the political arena (Johnson, 1997; van Dijk, 1996; Wolfsfeld, 1997). The social-political environment comprises the form of political government, society's dominant values, public opinion, political culture, and media ecology. Its importance lies in the fact that changes within it can compel the media to change their attitude toward minority groups and the way they are represented. This change in the image of minorities, which is dependent on the social-political environment, transforms this model into a dynamic one.

The connection between coverage of social groups and the sociopolitical environment has been examined in various studies. For example, I found that the coverage of peripheral cities in Israel was affected by the fact that the nation's elite felt threatened by people from these cities after the 1977 parliamentary elections (Avraham, 2000). Dunn, McGuirk, and Winchester (1995) claim that the image of industrial cities symbolized prosperity and power in the past, while in the postindustrial era they symbolize pollution, recession, and crisis. Other studies have shown that the image of settlement groups in the Israeli national media was affected by changes in the central values of society, the political culture, and public opinion (Avraham, 2003; Herzog & Shamir, 1994). Changes in the political culture can lead to changes in the interpretation of any given group, place, or event. For example, Yuchtman-Yaar and Ben-Rafael (1987) found that the media image of kibbutzim (collective agricultural settlements) had become more negative in recent years because of the growing individualism of Israeli society. The cases portrayed in each of these studies illustrate that images of places and groups may change in response to changes in the sociopolitical environment (Avraham & Ketter, 2008).

The Group's Public Relations

In the last two decades marginal groups also have worked to improve their image, claiming that poor representation fixates their adverse social status and prevents their integration into the majority groups. So the fourth factor addresses the public relations efforts made by members of the social group and their struggle to gain media access. As discussed in the previous sections, many factors can affect, positively or negatively, the image of a social group in the news media. So far we have seen that a social group's image is determined by factors over which, for the most part, it has no control. Social groups cannot control the sociopolitical context or the editorial decisions made by journalists. This does not mean that a social group cannot influence its own media image. It can do so through public relations and promotional efforts. These may help the social group's leaders to overcome factors that may cause the media either to ignore the group or to report negatively on it, such as a small population size, large distance from media centers, or reputation as a source for crime news.

There are three different components of the public relations efforts made by groups: awareness, resource allocation, and professionalism. The only public relations efforts that have the potential to be successful are those in which all three exist (Avraham, 2003).

- 1 *Awareness.* The first component is awareness among the social group leaders of the importance of media image and of how their actions and behavior affect the image of their social group in the national media (Walker, 1997).
- 2 *Allocating resources.* However, awareness is not enough; to succeed, they need to allocate sufficient resources to operate their public relations effort, for

example, an adequate budget, skilled people, and equipment (Wolfsfeld, 1988, 1997).

- 3 *Professionalism.* Even if a group's decision-makers are aware of the need for public relations and are willing to allocate resources to it, their efforts will fail if those responsible for implementing the strategy are not professional (Burgess, 1982). For example, I found that many social groups appoint spokespeople for different reasons, but due to their incompetence they are not able to help create a positive social group image in the news media (Avraham, 2003).

Changing Representations

How and Why Have News Representations of Minorities Changed Over Time?

The representation process is influenced by both the social-political reality and the symbolic reality within which the process exists (Adoni & Mane, 1984). Journalists have long ignored issues related to minority communities and individuals, and have not turned to minority groups as sources of information about news events or as the interpreters of such events. Exceptions were found in news about sports and entertainment, considered as "soft news." Over the years minority coverage has widened but has remained largely stereotypical, with generalizations, a sense of threat, and "us" and "them" distinctions (Larson, 2006). Notwithstanding the problematic representation of minorities, the changes that have taken place over the last two decades cannot be denied. Analyzing the change in representations of women and people of color in the US media as an example can help us understand why representations change over time.

Despite the fact that the representation of women and people of color in the media is still problematic, over the past two decades it is possible to see significant change, such as a more egalitarian representation of these two minority groups (in comparison with men and Caucasians), their casting in more significant roles in television series and films in comparison with the past – and not only as objects or in negative sexual contexts – and their association with exclusive products in advertising. The reasons for these changes in representation derive from changes that emerged in the social-political environment regarding the status of these two groups, such as those brought about by the civil rights and women's rights movements. For example, the increased purchasing power of many minority groups and women has enabled them to stage boycotts against marketers who use demeaning images in their advertising. In other instances, when minorities or women have attained key positions in media industries, they have directly influenced portrayals, resulting in less stereotyping and fewer demeaning representations (Cortese, 2004; Wolfsfeld et al., 2000).

Promoting Cultural Diversity in the Media

Recognition of the need for fair media representation of social groups increased after the racial riots of the 1960s in the United States. A committee that researched the reasons for these riots claimed that negative coverage of minorities in the media contributed to their frustration (First & Avraham, 2007). As a result, the committee suggested encouraging the media's decision-makers to employ minorities, to improve their media access, and to bring minority points of view much more often to the events that were covered. The committee believed that these steps, in conjunction with other measures, might decrease social-racial tensions. During the 1970s the American Editors Association called upon media outlets to employ many more minority newsmen (First & Avraham, 2007). Since then cultural diversity has become an important issue in the US media. For example, recent years have seen the creation of the "Newsroom Diversity Index," which analyzes the number of journalists in each media outlet who are minorities and compares the percentage of minorities among that area's target audience. There are a number of cases that show that promoting cultural diversity within media content does not lower ratings but actually increases them (First & Avraham, 2007). It is also important to mention that employing minorities and fair representation helped Channel 4 to become one of the most popular networks in the UK (First & Avraham, 2007).

In 2002 the European Monitoring Centre on Racism and Xenophobia published a collection of studies devoted to the place of the media in representing and promoting cultural diversity in European countries between 1995 and 2000 (ter Wal, 2002). The studies reviewed related both to the representation of different groups in different genres, primarily in the news, and to actions taken as a result of flawed representations. The rationale underlying this collection is an understanding that the media play a democratic and active role in their ability to grant a voice to the different actors in society and their way of reporting on ethnic, religious, and cultural groups. In other words, at the basis of the publication of this collection lies the perception that in multicultural societies, the discussion of representation has become part of the agenda of national and international institutions and organizations. In addition, those who deal with the subject are unwavering in their goal of improving the representation of minorities in the media (www.mediadiversity.org; www.multicultural.net). Studies that examine the reflection of cultural diversity in the media are being conducted and attempts are being made to identify the roots of the problematic representation of various groups. In these studies, use is made of diverse research methods that assist in analyzing subjects such as the scope and quality of the report, media routines, constraints and processes of newscast production, all of which form the patterns of media representation of minority groups (ter Wal, 2002). Over the last decade regulators have begun to address issues related to minority representation and the reflection of cultural diversity in the national media by means of legislation or incentives for franchisees, editors, and producers (ter Wal, 2002).

Studies conducted throughout the world on issues related to the media's representation of all aspects of a multicultural society (nationwide, private, and public) are the initiative of researchers working in academic frameworks as well as of the regulators responsible for the media's activities. In other words, theoretical-academic research is coupled with administrative research in the majority of European countries. In numerous cases, research serves as a catalyst for change and diverse initiatives in the sphere of broadcasts (ter Wal, 2002). In European countries that have become multicultural over the last decades of the twentieth century, awareness has been heightened of the need to reinforce the cultural diversity of the media, and national television stations have begun addressing the issue. For example, in the UK, production companies and broadcasting networks (including Channel 4, ITV, BBC, among others) joined forces to establish the Creative Diversity Network (CDN) with the objective of promoting a diverse representation of people and groups in the television contents they produce. Network directors claim that the UK is changing, and the content viewed on television should change as well, otherwise programs would become irrelevant to the lives of numerous viewers who would find it impossible to identify with the stories, actors, and characters that appear on screen. In addition, the objective of CDN is to increase the number of minorities employed by television networks and production companies. ITV, the largest commercial network, has been preparing to introduce multiculturalism to its national and regional broadcasts, and producers who work for the network must demonstrate how they expect to reflect multiculturalism in their programs (First & Avraham, 2007).

Conclusions

This chapter has dealt with studies that analyzed news coverage of minorities and marginal social groups. Interestingly, this field attracts researchers from many different countries, disciplines, and approaches, a fact that can help us understand the popularity of this field. My analysis has shown that research over the years has changed as regards theories, approaches, and methods. The studies referred to in this chapter provide many examples of biased news coverage of minorities. Journalistic images of these groups are still problematic, although changes have been seen over the last few decades. In other words, the news image of minorities is dynamic.

The amount of research on the image of minorities that was published during the 1990s increased compared to the 1970s and 1980s (Downing & Husband, 2005). These studies raised the problematic image of marginal groups to the public agenda, contributed to the positive changes that have occurred, and increased awareness of the news image of minorities among the public and journalists. These researchers deserve much credit for helping to advance this issue, especially given that other actors in the public sphere, such as journalists, government, and majority group leaders, exhibited no particular interest in promoting discussion on the subject.

While the subject of minority representation has been popular in the United States since the 1970s, in Europe the issue became more popular during the 1990s and the first decade of the new millennium. The increased interest in Europe can be seen primarily as a result of the large waves of immigration that took place during these years. The growing political-economic power of immigrant groups, among other factors, increased the demand for a change in media representation. Until that time, the issue of minority representation in the media was on the margins of public discourse in Europe. For example, it was only in the mid-2000s that the first Black news anchor was appointed on one of the French TV networks.

Most studies on the topic of news media representation of minority groups have used content analysis as a research method, primarily due to the convenience of and easy access to media content. But more studies have been addressing the role of media organizations in an attempt to understand what organizational considerations come into play in creating representations of minority groups. It must be mentioned that although several production and newsroom studies have been published, there is still a need for similar studies that will expose media organizations' routines, as well as the production codes and norms that guide reporters in news coverage of social groups (Downing & Husband, 2005). While representation studies were important in raising the issue to the public agenda, they were less effective in changing the situation because they did not reveal the production process behind the images. In addition, researchers have begun to address image enhancement efforts of minority leaders and NGOs as well as regulatory attempts to change media images.

It seems that changing the news image of minorities should result from dialogue between leaders of minority groups, journalists, editors, academics, and NGO representatives. Such cooperation can produce and develop a code of ethics, responsible professional standards, and an organizational code to help news teams cover issues related to minorities while avoiding problematic representations, generalizations, and stereotypes. All of the factors involved in the news coverage of minorities in the media involve great challenges but also many opportunities due to technological developments and changes in consumption patterns of different target audiences.

Is There Local Content on Television for Children Today?

Katalin Lustyik and Ruth Zanker

ABSTRACT

This chapter explores the dichotomy between “local” and “global” television content targeting children in the context of debates on media globalization. Our three case studies – TVNZ6 in New Zealand, Minimax in Eastern Europe, and Al Jazeera Children’s Channel in the Middle East – focus specifically on locally produced content offered on thematic children’s television channels launched to promote the cultural heritage of a particular nation or region. Operating in small but radically different media environments on different continents, these channels provide concrete examples of how local content is conceptualized and what types of content are being offered and produced for children today.

At this moment, there are nearly 2 billion children under the age of 18 worldwide who are targeted by an increasing number of television programs and dedicated children’s channels. As such globally circulated programs and networks expand their reach using multimedia platforms, the question becomes: Is there a need – and room for – locally produced television content for young people? From the perspectives of many governments, the public, and producers and broadcasters, locally produced content developed with the interest, perspective, and views of local children in mind can provide them with a sense of their own place in an increasingly complex world.

But how is local television content defined in different parts of the world today, and what kind of programs are actually being produced?

This chapter explores the dichotomy between “local” and “global” television content targeting children in the context of debates on media globalization. Our three case studies focus specifically on locally produced content offered on thematic children’s television channels launched to promote the cultural heritage of a particular nation or region. They operate in radically different media environments in three distinct regions of the world: the Middle East, postcommunist Europe, and the South Pacific. With the selection of our case studies we hope to provide concrete and distinct examples of how local content is conceptualized and what types of content is being produced for children today in various parts of the world. The first case study examines a thematic local children’s television network in New Zealand. TVNZ6 was a noncommercial digital channel that operated as part of a much attenuated public service broadcasting sector. This channel was dropped in February 2011, to reappear in May 2011 as Kidzone24 on the majority Murdoch-owned Sky platform. The second case study focuses on children’s television content in Hungary, and more specifically on Minimax Hungary, an Eastern European regional commercial network targeting children growing up in a dynamically transforming postcommunist media system. The third case study looks at television content produced in the Middle East for children by focusing on Al Jazeera Children’s Channel (JCC), a pan-Arabic non-commercial edutainment channel established in Qatar and funded by the Qatar Foundation for Education, Science, and Community Development (QF).

Undertaking this project has involved the collection and analysis of different types of data. In-depth interviews were conducted with representatives of the children’s television industry such as producers, network officials, and media researchers in three locations – Hungary (between 2000 and 2002), Qatar (in 2010), and New Zealand (between 2007 and 2011) – with the aim of gathering valuable insight from those whose work is connected to children’s television in their respective regions. In addition, we have collected and analyzed data from the television schedules of three thematic children’s channels between the spring of 2010 and summer of 2011: TVNZ6, Minimax Hungary, and Al Jazeera Children’s Channel. We specifically examined and compared the programming offered during the last week of April 2010 in the case of each channel. In each location, we also monitored other television channels that regularly offered children’s programming between the spring of 2010 and summer of 2011, and gathered some concrete examples from their early June 2011 schedules. The websites of the three television networks – tvnz6.co.nz (and subsequently tvnz.co.nz/kidzone24), minimax.hu, and jcc.net – as well as regional media watch groups were also monitored on a regular basis for information related to program content.

The chapter is divided into four main sections. The first provides a general overview of the key characteristics of the global children’s television landscape. The second section focuses on what local television content is and why it is still relevant. It also explores the dichotomy between “local” and “global” content in the context

of debates on media globalization. The third section looks at television content offered to children in three culturally, politically, and linguistically distinct regions of the world: the South Pacific, Eastern Europe, and the Middle East. Through our three case studies we examine the content of three thematic children's television channels, each of them launched during the last decade to promote the cultural heritage of the specific nation or region. The fourth section describes the similarities and key differences between how local content is conceptualized and offered by the selected television networks.

The Children's Television Landscape in a Global Context

The current global children's television landscape is incredibly diverse and dynamic. Some of the recent and most visible developments include young television viewers being offered more programming than ever before, with animated shows constituting the largest, fastest-growing, and often most creative portion of the programming (Messenger Davies, 2010). Television networks dedicated solely for this niche audience have become increasingly prominent and influential features of audiovisual markets around the world. The content of the most prominent globally available television networks such as Disney, Nickelodeon, and the Cartoon Network is produced in the United States, Japan, and the United Kingdom (e.g., Steemers, 2010).

Nations who dominate production also tend to dominate global cultural trade. The global production and programming ecologies for early childhood and older children are diverging in important ways. Early childhood programs are increasingly considered to be among the most exportable and commercially exploitable forms of children's television because they have several market advantages. They are set in largely uncontested early childhood landscapes and young children love viewing repeated programs. Such programs also appeal to new audiences every two years, which creates a short cycle and is cost effective for programmers, and animation and puppet shows can be cheaply dubbed (Steemers, 2010). For commissioners the initial costs may be high, but the returns from sales and the efficiencies generated by repeats for successful programs are enticing. It is not surprising that *Teletubbies*, *Dora*, *the Explorer*, or *Curious George* dominate global television services. The older school-aged group, arguably, makes for a much less homogeneous global audience, although some shows such as *SpongeBob SquarePants* have garnered a global audience. Audience provision becomes politically fraught as young people naturally begin to explore their individual agency and experiment with culture and identity (Australian Communication and Media Authority [ACMA], 2007).

Thematic channels targeting children constitute one of the fastest-growing and most dynamic sectors of the global media industry today (Steemers, 2010). Many children in Europe have access to the dozens of children's channels. In the last decade,

the number of dedicated channels targeting young viewers has skyrocketed and they have become increasingly diversified based on their primary goals, funding mechanisms, branding activity, target audiences, geographical reach, content, and use of digital platforms. There are age-specific (Baby TV for toddlers) and gender-specific (Disney DX targeting boys) channels, publicly funded channels (CBBC in the UK, Kinderkanal in Germany), and national channels funded and controlled by governments (Central TV's Children's Channel in China). And we can find channels associated with a particular country (TVNZ) or region (Minimax in Eastern Europe, Al Jazeera Children's Channel in the Middle East). The most prominent players, however, are the globally circulated channels owned by US-based transnational media corporations such as Viacom's Nickelodeon, Time Warner's Cartoon Network, and Disney. They are considered to be the "masters of the children's television universe" that have preserved their dominant position and generated "impressive profit margins" even though the competition has increased during the last years (Westcott, 2008). With "the accumulation of enormous capital, marketing experience and the control of the global market" they have a "tremendous competitive edge" to expand on a global scale (Wu & Chan, 2008, p. 198).

Recent global television hits for this age group are often high quality and based on extensive formative research. Nickelodeon's globally circulated content tends to reflect the tastes and desires of children tested in the United States, but it is branded as content that would appeal to children in many parts of the world (Hendershot, 2004). Nickelodeon is marketed as "the world's only multi-media entertainment brand dedicated exclusively to kids," and, according to Viacom's interactive global map, Nickelodeon has a "global reach" with a few exceptions such as Greenland (Viacom, 2010). What the map is not designed to show is the amount of locally produced content offered in various regions. According to Sandler (2004), the majority of Nickelodeon channels operating around the world had a strong US flavor with 75% of the programming composed of Nick US originals. As our sample schedules show, there is minimal or no local content offered on the Nickelodeon channels in New Zealand, Hungary, and the Arab world. As high production quality and well-researched Nickelodeon and Disney programs circulate globally, is locally produced television content still important?

The Importance of Local Content

Governmental and scholarly debates as well as public concerns have long focused on the asymmetries in the flow of global media content targeting children and young people. Before we examine local television content offered in our selected regions, this section briefly describes typical government officials, broadcasters, and scholarly positions on the importance of offering local content for children, as well as young people's perceptions of local and globally circulated television content.

For some public broadcasting advocates, such as a former head of Children's Television at the British Broadcasting Corporation (BBC), the asymmetries in global media content flow targeting young people mean that "in many parts of the developing world, children are moving from local radio to Disney or Fox without having any television which is specific to them and their culture" (Home, 1997). By contrast, national media-funding policy for children's television programming in many parts of the world is predicated on telling stories and hearing voices that reflect local cultures. To a former managing director of the Australian Broadcasting Corporation (ABC), domestic children's television is a "vitally important programming territory" that has to be "protected":

I'm not suggesting the influence being detrimental, but it's not a national Australian influence and it's not conceived or developed with a view to telling our stories [...] It was incredibly important and absolutely fundamental that Australian children received Australian programs scheduled by Australian producers and made available on Australian-owned and operated services. (Shier, 2001, para. 3)

Some media scholars such as Nyamnjoh (2002) argue that global media content can create rather explicit "hierarchies" by classifying children as "primary" and "secondary" media consumers:

Children who have access to global media content that is produced without their particular interest in mind are often victims of *second-hand media consumption* even as first-hand consumers, since the media content at their disposal seldom reflects their immediate cultural contexts. They may have qualified as global consumer citizens thanks to the purchasing power of their parents and guardians, but culturally, they remain consumer subjects, and must attune their palates to the dictates of undomesticated foreign media dishes. (Nyamnjoh, 2002, p. 43, emphasis added)

Children in many countries with small or underfinanced media markets can be "best conceptualized as being at the end of hybrid cultural flows" (Zanker, 2002, p. 78).

Even in nations with strict local content quotas, requirements for license renewals, and provision of comparatively generous funding sources for children's programming, local content today constitutes a very small portion of children's media choices. Now with national channel operators under ratings pressure from global branded niche channels that often lock up first-play hits, there is growing resistance to compliance. When the United Kingdom regulator removed children's provision from core licensing requirements, ITV, the country's largest commercial television network, stopped production and limited the repeat scheduled hours of content for children because they were perceived to be costly (Steemers, 2010). National dedicated children's channels program a mix of quality global and local reruns and more rarely commission new work. The two public digital children's channels in the United Kingdom, CBBC and CBeeBies, show predominantly repeated programs, overwhelmingly animated and many from the United States, while first-release programs

by British producers amounted to 1% of transmission time (UK Office of Communications [OFCOM], 2008). The newly launched Australian public digital channel ABC3 is not equipped to do better than the BBC's children's channels in meeting Australian children's media needs (Edgar, 2009).

Documents such as UNESCO's Convention on the Protection and Promotion of the Diversity of Cultural Expressions (2005) demonstrate a rather universal desire to create a balance between the protection of local cultures and the promotion of cross-border flows of cultural content, but it is largely contested how this can be achieved successfully. The United Nations' Convention on the Rights of the Child (1990) supports the media rights of children. Article 17 describes rights over access to information and material from a diversity of national and international sources, especially those aimed at the promotion of children's social, spiritual, and moral well-being and physical and mental health. This, importantly, includes the linguistic needs of indigenous children and access to their local cultures and information (UN Convention on the Rights of the Child, 1990).

The Convention is an ambiguous document, however. The tendency of the discourse of children's rights has been to admit children to the public sphere. It treats them, in certain respects, as citizens, as if children's views should be given due consideration in processes that affect their interests. This would appear to respect the right of children's voices to be heard within the cultures and communities in which they physically live and where they have tangible opportunities for cultural and political agency. This embraces provision of content in indigenous languages and access to local cultures and information. At the same time, "the Convention affirms the 'freedom' of children to seek, receive and impart information of all kinds [...] either orally, in writing, or in print, in the form of art, or through any media of the child's choice" (Buckingham, Davies, Jones, & Kelley, 1999, p. 169). Those targeting child consumers draw on freedom of speech principles to argue that children are active audiences whose agency should be respected, especially in terms of their preferences within popular consumer culture (Zanker, 2004).

Do children care for local content? Ethnographic and audience studies that focus on the children's consumption of local and globally circulated media products often reveal that they do not necessarily distinguish between them. Some scholars contend that while children might be consuming the same media content and using the same communication technologies, it does not necessarily result in cultural homogenization: "Conversely, the world is becoming ever more culturally diverse despite what seems like a common culture of consumption and style" (Lemish, Drotner, Liebes, Maigret, & Stad, 1998, p. 554). Others argue that given the global influence of a handful of media conglomerations, "[W]e might all be consuming Disney in complex and ambivalent ways, but in the end we are all still consuming the same thing. The space for alternative childhoods, for alternative stories to be told, may be steadily reducing" (Buckingham, 2001, p. 294).

The preference for global or local content is not a zero-sum game. Children's heightened interest in shared popular global culture does not preclude interest in the

local and particular and pleasure in sharing these stories. Research also tells us that viewers, young and old, usually prefer familiar settings and context, and their native language if the story is interesting and of high production quality (Thickett, 2007). Children want to experiment with their emerging sense of social agency and explore a range of identities within media spaces. Many of the contradictions discussed in this section as we explored the dichotomy between “local” and “global” television content for children are also revealed in our three case studies.

Local Content on Local Thematic Television

Hungary, Qatar, and New Zealand, along with many other countries, have been thoroughly integrated and incorporated into the world communication infrastructure, with a substantial amount of audiovisual programming targeting children coming from abroad. Our case studies examine the availability of locally produced television content in three different media institutional settings: an increasingly fragile national public service broadcasting sector (TVNZ6), regional commercial network owned by transnational media conglomeration (Minimax Hungary), and regional free-to-air noncommercial network funded by a private nonprofit organization (Al Jazeera Children’s Channel). In each of our cases studies, we provide some basic information about the country’s media system and then focus particularly on local versus nonlocal television content specifically offered to young viewers in general and in the case of dedicated locally launched channels.

New Zealand’s TVNZ6

New Zealand is a tiny nation of 4 million people, of which just over 850,000 are children aged up to 14 years. Television remains their top entertainment choice (Lealand & Zanker, 2008). New Zealand has a deregulated broadcasting system where the principle of “countering market failure” is a central plank of its broadcasting policy. There are no quota requirements or license renewal public service requirements. The result is a minimalist public service broadcasting model which places a sense of national identity as central to its mission. The 1989 Broadcasting Act put in place the local content broadcast funding commission, New Zealand On Air (NZoA), which funds, on a contestable basis, locally produced children’s programs to be shown on TV2 and TV3, two national commercial free-to-air networks. NZoA is required to consider the size of the audience that will benefit from the programming it funds, as well as issues of diversity. It is unlikely that locally produced New Zealand children’s television would exist without NZoA. Currently, approximately US\$13 million is allocated for the creation of local content for children and young people.

The local children's production ecology is fragile in New Zealand. National broadcasters have suffered a loss in advertising revenue, new voluntary codes around food advertising limit the range of advertisers, and child audiences are inexorably shifting to global satellite channels. Disney Channel, Cartoon Network, and Nickelodeon are overseas feeds, with any local content strictly related to marketing and branding of the channel. As an example, we include the 24-hour programming schedule of Nickelodeon New Zealand from June 2011 and added the country of production for each show (see Table 8.1). The majority of the programs, as can be seen in Table 8.1, are produced in the United States, with a few exceptions such as *Hi-5* (Australia), *Shaun the Sheep* (UK), and *Degrassi: Next Generation* (Canada).

Table 8.1 Nickelodeon New Zealand's schedule (June 7, 2011)

12:00 a.m.	<i>The Ren and Stimpy Show</i> (US)

Perhaps the closest to public service provision is found on Maori Television, funded directly by the government to foster indigenous Maori culture and language. However, an initiative in 2005 saw the government committing funding to the setting up and running costs for two digital noncommercial public service channels available through a “freeview” digital set-top box, but only for six years. Both channels lean heavily on the “mothership” of state broadcaster Television New Zealand (TVNZ) for infrastructure and are part of TVNZ’s market strategy of “content on every screen.” One of these digital channels was TVNZ6, a dedicated child- and family-oriented network that reached 60% of New Zealand homes. There were three zones on TVNZ6: early childhood-focused Kidzone from 6 a.m. to 4 p.m., TVNZ Family until 8.30 p.m., and then TVNZ Showcase until midnight.

The programming strategy on TVNZ6 was for commercial-free, educational programming designed to be enjoyed by parents and children together. Local content consisted of repeats of the many early-childhood programs commissioned over 20 years by commercial national broadcast channels from NZoA funding. These included the first locally designed early-childhood program commissioned by TV3 in the early

Table 8.2 TVNZ6 programs divided by origin of production (week of April 25, 2010)

Local content

(times not listed but repeated as cycles of programming from 6:00 a.m. to 4:00 p.m. family time)

Milly Molly (2006–8)

Zip and Mac 3D (from book) (2008)

Puzzle Inc

The Big Chair (1997–2000)

The Go Show (2005–6)

Giggles (2010 for TVNZ6)

Massey Fergusson (2002–4)

Buzzy Bee and Friends (2009)

P.e.t. Detectives (2003)

Freaky (2003)

Family-appeal local shows

6:30 p.m. *Just the Job*

7:00 p.m. *Park Rangers*

7:30 p.m. *Anzac Tales from Te Papa*

8:00 p.m. *The Kiwi who Saved Britain* (dramatized life of Keith Park)

9:00 p.m. *Mirror Mirror* (kidult drama)

Nonlocal content

The Mole Sisters (from book), animation (Canada, 2003)

Rupert Bear (from book), animation (Canada, 1991–7)

Chuggington, animation (UK, 2008)

Zoomix, animation (Spain, 2007)

Caillou (from book), animation (Canada, 2008)

Roll Play, series (Canada)

Fireman Sam, animation (UK: Wales, 1985–)

Spider 2d, animation (UK, 1991–)

Hurray for Huckle (from book), animation (Canada, 2007)

Eco Company (teens) (US, 2009)

The Animal Shelf, animated (US, 1990s)

Story of Tracey Beaker (from book) (UK, 2001–8)

24Seven, boarding house drama (UK, 2002–6)

Roman Mysteries (from book) (UK)

1990s, *You and Me*. Other repeated NZoA-funded early-childhood programs include *The Big Chair*, *Bumble*, *The Dress Up Box*, and *Buzz and Popp*. Schedules were rotated and repeated over the week. “Quality” imported shows like *Rupert Bear*, *Fireman Sam*, *Postman Pat*, *Chuggington*, *The Mole Sisters*, *Angelina Ballerina*, *Caillou*, *Berenstain Bears*, and *The Wiggles* also rotated in the schedule.

Most local shows in the sample week from 2010 were reruns of children’s programs funded in past years by NZoA (see Table 8.2). Only two shows were funded using public funding allocated to TVNZ6: *Giggles*, a sketch comedy show for early childhood, and *Kidzone*, a presenter-driven linking show that repeated three times a

day (at 8.35 a.m., 12.35 a.m., and 4.35 a.m.). Four series of 150 (5-minute) low-cost episodes of *Kidzone* were commissioned. Each week has a different theme and its young adult presenters, a Pacific mix, present “live” music, dance, and song in a range of languages. The producer, director, and team are early-childhood trained. Presenters suggest activities for when television is turned off and validate children in their cultural Pacifica diversity. New Zealand children contribute stories to share. Phillips, the show’s producer, uses television to “scaffold learning” (M. Phillips, personal communication, 2010). *Anzac Tales from Te Papa*, screened in the evening and targeting families, was a special compilation of military-related *Tales from Te Papa* episodes in commemoration of Anzac Day (Australia and New Zealand memorial day).

TVNZ6 commissioned only one show for tweens, the short form *In Between*, which included episodes on sibling rivalry, being gay, depression, and drugs. *In Between* linked to Bebo, a popular social network site, but lack of promotion meant that the power of interactivity was never really tested. *Kidzone* morphed into TVNZ6 Family. TVNZ6 Family only shows repeated, previously viewed local content, such as “kidult” dramas like *Being Eve*, *Holly’s Heroes*, and *Mirror Mirror*, also commissioned earlier from the children’s fund of NZoA. Other locally produced content includes shows such as *Just the Job* (career show), *Pioneer House* (historical reality show), and *Korero Mai* (learning Maori). Some local content has been funded in conjunction with the national museum Te Papa and the Department of Conservation. These shows recirculate within these institutions and via DVDs in schools.

TVNZ6 was unpromoted by its “mothership,” the national TVNZ network, yet still gained a fervent following. In February 2011, after data for this study had been collected, TVNZ announced that TVNZ6 was to close down as a free public service channel. In its place TVNZ negotiated a profit-share deal with the pay platform Sky. In May 2011, *Kidzone24* appeared as a 24-hour channel as part of the basic Sky satellite package that reaches 49% of New Zealand homes. This deal caused some controversy, given the investment from public funds in the local programs on its schedule, and fans built a Facebook page (facebook.com/keepkidzone) to share their concerns. The programming of *Kidzone24*, similarly to TVNZ6, is a combination of older and newer local content and nonviolent educational programs that are predominantly North American and European productions and co-productions (see Table 8.3).

Minimax Hungary

Hungary, a postcommunist nation of 10 million, has one of the most highly developed television markets in Eastern Europe, dominated by two foreign-owned commercial broadcast channels, RTL-Klub (RTL Group) and TV2 (ProsiebenSat1). The public service broadcaster Hungarian Television, after being in a monopoly position for over 40 years during the communist era, saw its national viewership decline to 13% during the last decade (MAVISE, 2010). While the production of children’s programming existed as a core service since the introduction of television in Hungary

in the 1950s, today, internationally circulated popular shows dominate the children's television sector.

Currently, about a dozen niche television channels compete for young viewers, among them Boomerang TV and Cartoon Network owned by Time Warner, Jetix, owned by Disney, KidsCo, owned by NBC Universal, and Minimax and JimJam, owned by Liberty Global (see Table 8.4).

Shows from the extensive library of Nickelodeon, the Cartoon Network, and Disney have been offered on national broadcast channels in Hungary since the mid-1990s, dubbed in Hungarian. Today, these US-based networks are available as stand-alone channels, as can be seen from Table 8.4. The majority of children's channels operating in Hungary today provide a local-language feed and a website but no locally produced content. As an example, we include the programming schedule of Nickelodeon from June 2011 (see Table 8.5). The titles are translated from Hungarian to English and the country of production is indicated for each show. As Table 8.5 shows, the Nickelodeon channel available in Hungary had no locally produced content and relied heavily on US Nickelodeon productions. Many of its programs overlapped with those offered on Nickelodeon New Zealand's channel.

While the total number of shows offered for children has grown exponentially during the last 20 years in Hungary and other Eastern European countries, there is

Table 8.4 Children's channels available in Hungary (in spring 2011)

<i>Name</i>	<i>Broadcasting company</i>	<i>Genre</i>	<i>Main targeted country</i>

very little locally produced content available. Even though local content quotas for broadcasters exist in Hungary, both public and commercial national broadcasters claim that they do not have the financial resources to invest in "the revitalization" of local children's programming funded by the state during the communist era (ORTT, personal communication, 2002). While in 2002 the Hungarian National Radio and Television Commission (ORTT) voted to allocate a small portion of broadcasting funds to support the production of local children's programming, with the Ministry of Culture also creating a fund to promote and protect local cultural identity by means of locally produced television programs, the revitalization has not happened yet (Országos televíziók, 2002). As an example, we include weekday programming schedules of the main national broadcasters: public service broadcast channels M1 and M2, and commercial channels RTL-Klub and TV2 (see Table 8.6). Programs offered specifically for children that day consisted of an evening block on M2. None of the programs shown in the block was produced locally.

The only channel that has succeeded in creating a "local feel" is Minimax Hungary. Symbolically, as a present for Hungarian children from Santa Claus, Minimax was launched on December 6, 1999, targeting the 4 to 14 age group. According to its Hungarian founders, the idea of the television channel came from a group of

enthusiastic friends who wanted children to be able to watch their favorite programs, which simply disappeared from television screens after the privatization and deregulation of Hungary's media system in the 1990s (Minimax, personal communication, 2002). The group examined each television channel available in Hungary at the time and came up with services for children that the others lacked: nonviolent, educational but simultaneously entertaining programming that originated primarily from Europe, with special emphasis on Eastern European puppet and animated programs that were popular during the 1970s and 1980s. Minimax's immediate success according to its program director was based on its nonviolent and local and regional content, as well as its continuous contact with viewers (Lazar, 2003). In its early years the channel emphasized that over 80% of the programming originated from Europe, with 20–25% of it coming from Hungary and Eastern Europe, such as the once popular Polish cartoon *Lolka and Bolka* (Minimax, personal communication, 2002). Since the mid-2000s, Minimax's programming schedule has relied heavily on global hits from the United States, United Kingdom, France, Canada, and Australia such as *Postman Pat*, *Global Grover*, *Elmo's World*, *My Little Pony*, *Franklin*, and the *Magic School Bus*.

As the sample schedule for April 30, 2010 (Friday) shows (Table 8.7), the majority of the programs came from the United States and Western European countries, with the exception of *Bob and Bobek* (*Bob a Bobek, králíci z klobouku*, 1979), a Czech animation popular throughout Eastern Europe, including Hungary, during the 1980s. Many of the programs listed in Table 8.7 were repeated during the day (the same or a different episode).

There were four 5-minute-long programs produced specifically for Hungarian children between 6 a.m. and 8 p.m. during the sample week (see Table 8.7). *Minimax Híradó* (Minimax News) is a monthly 5-minute-long magazine-style program with two hosts produced by the network. The short segments focus on local artists, local books, or cultural events, some of which seem to target parents rather than children. During April 2010, five episodes of the show rotated daily in the schedule. The

program series *Te már olvastad?* (Have you read it?) started in the fall of 2009 as part of the network's campaign, in partnership with libraries and publishers, to promote books and reading among a new generation of children who preferred television and gaming. Hungarian celebrities, including musicians, television hosts, politicians, and sports personalities, were asked to talk about their favorite childhood books and the importance of reading.

Alma-klip is a music video clip created by the network working in partnership with the popular Hungarian children's music group Alma (Apple). The latest Minimax in-house production launched in 2011, *Minisef* (Minichief), teaches children basic cooking techniques that do not require adult assistance in the kitchen.

The last local program, scheduled twice a day during the sample week from 2010, was *Magyar Népmesék* (Hungarian Folk Tales), a 10-minute-long animated series that used a local folk art visual style and archaic folk-style narration. The series has been

around for decades and is considered a significant part of the nation's audiovisual heritage. It is among the few television programs that survived regime changes in Hungary, with a total of 89 episodes created between 1978 and 2006.

Minimax has become an influential local brand in children's media culture in Hungary and was celebrated as an Eastern European success story at the end of the 1990s. Since 2007, however, Minimax has been fully owned by Chello Central Europe, the Europe-based content division of Liberty Global, a US-based transnational media company. Today Minimax is a leading commercial pan-regional network with local language feeds and dedicated websites provided for Romania, the Czech Republic, Slovakia, Moldova, and the former Yugoslavian countries with the exception of Slovenia.

Al Jazeera Children's Channel

When the Qatari First Lady Sheikha Mozah bint Nasser al Missned suggested the establishment of a noncommercial educational/entertainment children's channel for the region in the early 2000s, it seemed like a "fantasy" in the Arab world (Lepeska, 2010). The lack of consideration by either governments or corporations to fund children's programming meant that locally produced content practically did not exist until the mid-2000s (Kuttab, 2007). Most of the children's programming offered on national television channels across the region was imported and dubbed in local dialects. During recent years, the number of dedicated children's channels in the region exploded with the arrival of US-based branded channels such as Disney XD, Disney Channel, Playhouse Disney, Nickelodeon Arabia, Boomerang, JimJam, and Middle Eastern-based networks including Spacetoon TV, MCB3, and Al Jazeera Children's Channel (JCC) (see Table 8.8).

Table 8.8 Children's channels available in the Middle East between 2008 and 2011

<i>Name</i>	<i>Broadcasting company</i>	<i>Genre</i>	<i>Available in 2011</i>
Al Jazeera Children's Channel (JCC)	Al Jazeera Network	Children's channel	yes
Boomerang	Turner Broadcasting International Limited	Children's channel	yes
Cartoon Network	Turner Broadcasting International Limited	Children's channel	yes
Disney Channel, Disney XD, Playhouse Disney	The Walt Disney Company Limited	Children's channel	yes
JimJam	JimJam Television Limited	Children's channel	yes
MCB3	Middle East Broadcasting Center (MBC), UAE	Children's channel	yes
Nickelodeon Arabia	Nickelodeon UK Limited	Children's channel	no
Spacetoon	Spacetoon Media Group, UAE		yes

Nickelodeon Arabia, an Arabic-language, free-to-air channel dedicated to Arab children aged 2 to 14 years old, launched in 2008 and included its most popular shows, such as preschool hit *Dora the Explorer*, *SpongeBob SquarePants* and *Jimmy Neutron* for older children, live-action *Drake & Josh* and *Unfabulous*, and the Nickelodeon Kids' Choice Awards. The network was a result of a partnership between Viacom's MTV Networks International (MTVNI) and the Arab Media Group (AMG) of the United Arab Emirates. Nickelodeon Arabia went off the air in 2009 as a result of media ownership changes in the United Arab Emirates. As a result, since November 2010 a Nickelodeon block exists on the children's entertainment channel MBC3 that includes *SpongeBob SquarePants*, *The Mighty B!*, *The Fairly OddParents*, *Fanboy and Chum Chum*, *The Penguins of Madagascar*, *Back at the Barnyard*, and *My Life as a Teenage Robot*. The content of the majority of children's channels is imported and dubbed in local dialects, the exceptions being MBC3, which offers some locally produced shows, and Al Jazeera Children's Channel.

After three years of research and planning, the Al Jazeera Children's Channel (JCC) – a pan-Arabic edutainment network dedicated to children – was launched in September 2005 in Qatar. While the channel shares its name with the influential Al Jazeera news network, also established in Qatar almost a decade earlier, and the board director who also oversees the Al Jazeera Network, they are completely independent from each other. JCC, along with satellite campuses of prestigious US higher education institutions, is located in the Qatar Foundation for Education, Science, and Community Development's flagship project, Education City, on the outskirts of Doha.

JCC, with its primary mission "to encourage the love of learning and discovery" and operating as a noncommercial enterprise funded by the Qatar Foundation, represents a unique model (JCC, personal communication, 2010). The overall mission of the channel, echoing that of the Qatar Foundation, is to make a difference in the lives of Arab youth by promoting "self-esteem, understanding and freedom of thought" (Al Jazeera Children's Channel, 2007). JCC's ambition is to plant "the seed of hope for a better tomorrow, but also for a better Arab citizen" (general manager, quoted in Lepeska, 2010), and to function as a bridge to connect Arab children around the world. JCC's language choice of classical Arabic also aims to promote a pan-Arabic shared identity and serves as a tool for learning or practicing Arabic among the Arab diaspora. Many older children, growing up on programs dubbed in regional dialects, however, find cartoon characters speaking eloquent classical Arabic "strange." They make fun of their younger siblings, who naturally use the vocabulary previously associated with school (JCC, personal communication, 2010).

Local content is perceived to be crucial for JCC, and its programming consists of 80% local content, with some of the shows produced in-house in one of three high-tech studios. Local production mainly consists of nonfictional programs with a preference for incorporating real children in real-life situations with regional relevance (JCC, personal communication, 2010). According to JCC, "[T]his goal is realized by carefully studying and producing relevant content and ensuring that it resonates with the needs of this target audience's daily life as well as their culture" (Al Jazeera 2006–2011).

Among the most popular JCC-produced programs are game shows such as *Ad Darb*, in which teams of children compete in various subject areas such as history, science, and geography in front of a live studio audience. JCC also offers thematic magazine shows for the first time in the region. Its weekly debate show *Nadra Ala* encourages children to speak up freely and form their own opinions on a variety of issues. Topics have included female circumcision, illiteracy, and child labor. In each episode regional correspondents share their international reports with the audience and a panel of experts. The show *Atfal Al Mahjar* is a weekly magazine that focuses on the Arab diaspora and on the everyday lives and challenges of Arab children and families living in non-Arab countries. One of the goals of the show is to highlight the Arab family's role in supporting their children's native language, faith, and traditions. *Min Al Malaab* is a sports magazine, while *Al Abtal* follows the daily activities of seven groups of student athletes and covers their daily routines, including their educational and cultural lives. *Kallemni* is a discussion show that features one Arab child in each episode, who shares his or her thoughts, personal insights, emotions, and feelings with the host of the program.

Other JCC programs have more of an entertainment element, such as *Ana wa ekhwait*, a comedy show depicting family life and values in the region. The main plot focuses on a Syrian family moving to Qatar, where the father working at a radio station encounters comedic characters and situations. Several programs produced in-house, such as Baraem's animated series *Nan and Lili*, have won over critics at international festivals. While special programming is offered for Ramadan and there is a show about the Qur'an, religious ideals are not allowed to dominate the channel. However, as JCC's general manager explains, "Islam is part of our daily life, it's our religion, and it should be integrated into our content" (quoted by Lepeska, 2010).

As the list of programs aired on April 30, 2010 (Friday) shows (Table 8.9), there were 11 different programs produced specifically for Arab children, several of them shown at least twice a day with different episodes.

Besides the JCC-produced shows, several others are co-produced in partnership with production firms in the United Kingdom, Canada, and Japan. Nonlocal content is "carefully selected" from the international market with the aim to open up "avenues for Arab children to learn about different environments and cultures" (JCC, n.d.). After its initial success, JCC split into two channels in January 2009 to better serve specific age groups. Baraem TV (*baraem* means "buds") is aimed at 3- to 6-year-olds, while the original JCC is dedicated to 7- to 15-year-olds. The latest addition to JCC's expansion is Taalam TV, the first Arabic video-on-demand (VOD) educational platform, launched in 2010. It primarily targets schools and educators, who can access detailed programming information and watch the shows at any time.

Today Al Jazeera Children's Channel and Baraem reach 45 to 50 million households in all 22 Arab countries, many parts of Africa, Europe, and Asia. With the planned future launch of an English-language version of Baraem TV, the next territory for the network is North America.

Table 8.9 JCC programs divided by origin of production (April 30, 2010)**Local content**

Min al Malaab (Sports Corner) (15 min)
Ana Wa Ekhwati (Me & My Siblings) (15 min)

The Eggs (Canada/Australia, 15 min)
Sitting Duck (US/UK/Canada, 30 min)
Benjamin the Elephant (Germany, 30 min)

Locals Answering Back?

Our three case studies described locally launched children's television channels in different countries representing diverse regions and media models. Minimax Hungary represented a fully commercial channel that achieved immediate popularity with its local flavor. Today Minimax offers very little local content and is owned by a transnational media conglomeration. Hungary's media system, along with many others in Eastern Europe, can still be described as "transitional," and the mechanisms are not yet in place to support local television content in the current, largely privatized and commercialized media landscape that replaced the state-operated system.

Al Jazeera Children's Channel (and Baraem TV), located in the Middle East, represent a noncommercial model with the primary mission to educate children by providing edutainment programs with as much local flavor as possible. Providing funding for JCC in the oil-and-gas-rich Gulf state, which has the second-highest GDP per capita in the world, seems effortless. The only programming criterion for JCC is to offer quality content that educates and makes better future citizens.

New Zealand's TVNZ6 provided a noncommercial children's service within the public media sector. It lacked the financial deep pockets of Qatar, and could not draw on parental nostalgia for Eastern European shows and the powerful commercial branding employed by Minimax Hungary. But in its short four years, TVNZ6 proved itself to be an innovative local content channel. Run on a shoestring, the noncom-

mercial digital channel had a strong commitment to Pacific-flavored local content. The decision to put publicly funded children's programs behind the paywall of Sky is business driven. It indicates that local content has value to local commercial interests, if only as a point of difference within the overwhelmingly globalized media environment. But will its value be enough to warrant new local commissions? Or will we see repeated circulation of local reruns originally funded for full service national free-to-air channels?

All channels studied were careful to assess the appropriateness of their local and imported shows for their audiences and aspired to an inventory combining gentle entertainment and engaging "edutainment." Their ratio of local content, however, varied greatly. In the case of Minimax, local content constituted a tiny segment and was repeated endlessly. In the case of JCC, a relatively large portion of its content was produced locally or co-produced with international partners. Continuous government funding has enabled a generation of children since 2005 to acquire Arabic from a popular inventory of programs, some of which are challenging in content. In New Zealand, public service provision and local content are inextricably intertwined. TVNZ6 (and now Kidzone24's) children's schedules draw cost-effectively on two decades of public service inventory as well as on some modest and cost-effective local commissions of its own.

Regardless of the amount of actual local content, all three channels identified the promotion of local culture and cultural heritage as one of their primary missions and described their key programming style as noncommercial and socially responsible edutainment. The interpretation of what constitutes local culture and cultural heritage differs in the three locales. In the case of JCC, the address has broadened from the national to a pan-Arabic region and beyond to the Arabic diaspora around the world. JCC provides a mix of programs that address children primarily as citizens rather than as consumers. JCC's promotion of the classical Arabic language aims to tie more than 20 countries and over 350 million Arabic speakers together in a region, where the language of finance and education is increasingly English. In postcommunist Eastern Europe, Minimax has positioned "our culture" as parental nostalgia for regional classics. Despite its brand being marketed as a local channel, it has not commissioned much new material to appeal to the tastes of current children. Minimax's address has also gradually broadened to include several countries in the region, where children watch the same content dubbed into Romanian, Czech, Slovak, Croatian, and other languages. Minimax's local appeal, in many ways, has been reserved instead for the commodified spaces of interactive clubs and merchandising. New Zealand's TVNZ6 attempted to create a national noncommercial channel for young people living in the Pacific. The verdict is out on the role that Kidzone24 will play in the regional mix as the pay platform Sky lobbies for a share of NZoA free-to-air funding.

One of the similarities we have observed between the three channels is the importance of continuous interaction with children and parents and receiving feedback from them. Both Minimax and JCC also regularly conduct focus group research with children and parents, who are asked to preview programs that the channels plan to

acquire or shows in production. In the case of JCC, both quantitative and qualitative studies are conducted regularly in different countries in the region and local educational programs are tested with different audience groups during the production phase. We also found that local content producers face similar challenges in creating shows particularly for older children. In New Zealand, producers say that they understand the needs of early childhood and younger children (e.g., 5- to 9-year-olds) but struggle with what appears to be a relentless shift by preteens (age 10–13) toward global media flows. As one New Zealand producer puts it, “They are a whole new challenge because they don’t tell you what they do want, but they do tell you what they don’t like and turn off” (J. Morrell, personal communication, 2009).

Conclusion

Television program imports that fill up the majority of children’s channels do not constitute a homogeneous group. In the case of TVNZ6, Minimax, and Al Jazeera Children’s Channel, television schedules are constructed to draw on so-called “good,” gentle, and educational imports from Europe, Australia, and North America. We found in our interview discussions conducted on three continents that there was often an implicit distinction made between “good” imports, such as Czech fairy tales, and “bad” imports, principally in the form of US and Japanese action-adventure cartoons. Globally circulated channels such as Nickelodeon and Disney also offer quality educational and nonviolent programs primarily for preschoolers and position themselves as socially responsible brands. What sets JCC, Minimax, and TVNZ6 apart are their founding or regulatory cultural objectives. They claim to offer local, culturally specific places for children, away from highly commodified popular culture created for the universal active consumer by transnational media corporations.

That said, however, we have found that nationally based thematic children’s channels can also grow into successful market players beyond original national boundaries and even be sold off to transnational media conglomerations. Minimax has laid claim to a regional market share in children’s entertainment, and JCC has grown exponentially in market share and popularity across widely flung Arabic-speaking nations. Both can be said to speak back to dominant audiovisual children’s flows from the periphery.

The volume of new-release Arabic content available for children on Qatar’s JCC after only five years in existence reflects the power to move quickly and decisively to meet cultural and educational objectives, as well as knowledge of local audience needs. Part of this power comes from economic clout. The channel can commission locally and at the global level on its own terms. This is in stark contrast to TVNZ6 in New Zealand, which, despite its valued mix of imported and Pacific regional appeal, could not reach its audience because of lack of government investment. Critically, this includes being able to find traction within the interactive places to

which young people are drawn. Hungary's Minimax lies somewhere in between the other two case studies. Currently, it commissions very little new local content, despite it being branded as an Eastern European channel, but it has managed to build a successful multimedia empire in the region.

As we have discovered through our case studies, nationally launched children's channels aim to provide safe and culturally approved places for children, with varying success. Each channel responds in its own unique way to the turbulence of media globalization and cultural and linguistic anxieties stemming from this. While television continues to be the primary media window for children today, and this chapter's main goal was to examine the dynamics of local and global television content, they can only be understood as part of multi-platform media systems. Moving beyond the local–global dichotomy, another important dimension of this debate for future studies would be to examine “the ability or inability” of local content offered on various television channels to “empower” young people “to have influence over the course of their lives” (Kraidy, 2005, p. 151).

The Evolution of Hollywood Latinidad

Latina/o Representation and Stardom in US Entertainment Media

Mary C. Beltrán

ABSTRACT

This essay explores the evolution of Latina/o representation in Hollywood film and US television by reviewing the scholarship on Latina/o representation and stardom. The essay is structured in relation to methodological approaches and tropes that have emerged and become fundamental to the field of study as it has evolved. The sections below are organized to hone in on the themes of (1) Latina/o visibility and stereotypes; (2) racialization and the privileging of particular “Latin looks”; (3) constructions of Latinidad and related questions of authenticity; (4) hybridity and transnationalism; (5) self-representation and Latina/o participation within the mainstream media industries; and (6) recent hypervisibility and other contemporary trends. It concludes by addressing the multiple implications of today’s hypervisibility of Latina/o actors and calls for further in-depth study of such multivalent representation and its impact.

Scholars have explored Latina and Latino (hereafter, Latina/o) media representation and stardom in US film and television from a variety of disciplinary and methodological approaches. This chapter explores the evolution of this scholarship, some of the major research questions and themes that have arisen, and the concerns central to present-day studies. In illustration of these themes it also surveys key historical eras of Latina/o

representation and star promotion, and reflects on the impact of the rise of Latina/o self-representation and contemporary trends that have yet to be studied.

As individuals with ancestry in the US Southwest, Puerto Rico, or Latin American countries, Latina/os, also termed Hispanics,¹ are widely diverse, even while their cinematic and televisual representation has often flattened differences in its construction of an imagined, universal Latin-ness, or *Latinidad*. This representational history has its roots in Mexican American history, given that land that forms part of the Southwestern United States transferred from Mexico to the United States in 1848, transforming Mexican citizens to Mexican Americans overnight.² Mexican Americans also historically have been the largest US Latina/o group. In 2000 they comprised 58.5% of all Latina/o Americans, followed by Puerto Ricans (10%), Cuban Americans (3.5%), and smaller but steadily increasing numbers of Latina/os of Central and South American descent (US Census Bureau, 2001).³ Given their varied histories, Latina/os differ widely with respect to such factors as class, race, generation, and media habits. Spanish-language usage is a commonality among many Latina/os, but US Latinos may or may not speak Spanish. Younger Latina/os are also increasingly acculturated, demonstrating hybrid media consumption of both English and Spanish-language popular culture forms.⁴

Latina/o representation in US film and television is increasingly important to scholarship on US media, as the Latina/o population has grown exponentially in the last century and is expected to continue to increase. Latina/os became the largest non-White group in the United States in 2000 and now comprise over 15% of the population and 20% of youth under 18, according to the US Census Bureau. With respect to projections, it is predicted that Latina/os will comprise at least 24.4% of the US population by 2050.⁵

Scholarship on Latina/o representation in US film and English-language entertainment television, however, is still relatively new. Academic books on the topic began to be published in the early 1980s; pioneering scholars included Arthur Pettit, Charles Ramírez Berg, Ana M. López, Chon Noriega, Angharad Valdivia, and Clara Rodríguez. For the most part this first generation of scholars was self-taught and trained in history, Spanish language and literature, English, or other disciplines, as university departments in Latina/o studies and film and media studies were just being established. Some of the work of these scholars thus necessarily involved establishing the legitimacy of studying Latina/os and media representation, as Valdivia (2008) and Ramírez Berg (2002) have noted. The next generations of scholars have benefited from these inroads and the increasing establishment of Latina/o studies and media studies within the academy as well as from the growth and acceptance of cultural studies traditions. Differing approaches and questions thus have guided scholars of each academic generation.

With this history in mind, this introduction to scholarship on Latina/o representation and stardom is structured in relation to methodological approaches and tropes that have emerged and become fundamental to the field of study as it has evolved. The sections below are organized to hone in on the themes of (1) Latina/o

visibility and stereotypes; (2) racialization and the privileging of particular “Latin looks”; (3) constructions of Latinidad and related questions of authenticity; (4) hybridity and transnationalism; (5) self-representation and Latina/o participation within the mainstream media industries; and (6) recent hypervisibility and other contemporary trends.

Invisibility and Stereotypes

Much of the early scholarship on Latina/o film and television representation focused broadly on patterns in how Latina/o characters and images were depicted, and argued that such representation was typically characterized by invisibility and stereotype – recurring, one-dimensional characterizations typically assigned to subordinate groups in a society. The underrepresentation and marginalization of Latina/o characters in minor, often denigrating roles has a direct relationship to the history of Latina/os, and specifically Mexican Americans, in the United States. Mexicans and later Mexican Americans were often seen as impediments to the move westward by European settlers in the 1800s; notions of “Manifest Destiny” circulated in frontier literature and other artifacts of mediated culture tended to pose Mexican Americans as inferior in intelligence and integrity, and thus unworthy of the rights of citizenship. Early films merely rearticulated these “American” stereotypes. Arthur Pettit (1981) was one of the first scholars to systematically document Latina/o character types as witnessed in frontier literature and silent film Westerns; such characters typically might be villainous Mexican “greasers” or untrustworthy and lusty peasant women. Such representations began the pattern of constructing Latina/os as “Others” in contrast to White heroes and heroines, in a dynamic process similar to that other racialized, colonialist, and gendered representation.

While in recent years scholars are less likely to focus solely on stereotypes in study of Latina/o representation, the stark patterns in how Latina/os were depicted in Hollywood film prior to the 1970s prompted the first generation of researchers to hone in on them and document their prevalence. More specifically, Latina/o characters often were presented as especially sexual, aggressive, or childlike in characterizations that reified biased associations held by some US citizens of Latina/o women and men. Ramírez Berg (1990, 2002) summarized these representational patterns in relation to six Latina/o character types typical of Hollywood films: the Bandito and the Harlot, characters with aggressive, criminal, and promiscuous tendencies that can be traced back to the greaser films; the Latin Lover and the Dark Lady, characters based on notions of Latina/os as innately passionate and sexual, with this sensuality at times paired with more negative traits; and the Male Buffoon and the Female Clown, comic but typically unintelligent and infantile characters.

Similarly, Ella Shohat and Robert Stam (1994) and Frances Aparicio and Susana Chávez-Silverman (1997) highlighted Hollywood’s tendency to confine Latina/os

and Latin Americans to characterizations that relied heavily on tropical island-related associations that reinforced the myth of discovery (Shohat & Stam, 1994), neocolonialist notions of South American, African, and Asian countries and their people and products as ripe for the taking. Such tropicalist tropes, as Aparicio and Chávez-Silverman (1997) described them, constructed Latina/o characters as possessing passionate tempers and/or libidos and through references to heat and spice. As noted by early scholars as well, Latina/os historically were not employed as producers in the film and television industries prior to the 1980s,⁶ which likely played a strong role in the continued construction of Latina/os in this manner within Hollywood storylines.

Meanwhile, another group of early researchers, communication studies scholars, approached these patterns with quantitative methodological tools to study representation in the medium of television. Social science-oriented researchers, for instance, have tallied the visibility and status of Latina/o prime-time television characters, typically coding whether such characters were in major or minor roles as professionals, criminals, or servants, in studies of US televisual diversity that documented the underrepresentation of Latina/os and the tendency in television's first decades⁷ to include Latina/os primarily in marginal and criminal roles. S. Robert Lichter and Daniel Amundson (1994), for instance, found that Latina/o characters constituted no more than 2–3% of all prime-time roles from the 1950s through the early 1990s, even while the Latino population grew dramatically during these decades. Subsequent studies have found Latina/os only slightly more visible as television characters. Some of the most recent studies include that of Dana Mastro and Bradley Greenberg (2000), Allison Hoffman and Chon Noriega (2004), and Elizabeth Monk-Turner and colleagues (2010). Monk-Turner and colleagues concluded that Latina/os comprised only 5% of characters in the March 2007 prime-time lineup.

Building on research that explored Latina/o representation in relation to image and stereotype, some scholars of Latina/o stardom⁸ also took note that Latina/o film stars' promotional campaigns often capitalized on the employment of stereotypes held by White Americans of Latina/os and Latin Americans, as they were believed authentic or were thought to increase appeal to White audiences. Latina stars thus were at times promoted in a manner in tune with the cinematic stereotypes of harlots or dark ladies, to borrow Ramírez Berg's terms. In addition, as I found in my research (Beltrán, 2009) on the historical trajectory of the promotion of Latina/o stars, they might be promoted through sexualized emphasis on their bodies and described as spicy, vivacious, or through some variation on such terminology, whether as "spitfires," "pepperpots," or "hot tamales." As I note in my research on Puerto Rican actress Rita Moreno's 1950s film career (Beltrán, 2009), Moreno found that playing up her public image as a flamboyant spitfire was often the only way she could get the attention of reporters at the time. Moreno and other Latina/o stars in past decades also faced limitations in regard to what roles they were allowed to audition for and the types of roles to which they were subsequently confined. Valdivia (1998), pointing to Puerto Rican actress Rosie Perez's early film career as illustration, described such patterns as an example of the symbolic annihilation⁹ that Latino and

female actors often experienced. Perez, Valdivia notes, typically was cast only as loud, working-class Latinas who served in support of other characters' goals rather than as protagonists in their own right.

While focus on stereotype in relation to Latina/o representation drove some of the earliest scholarship on the topic, it came to be viewed as limiting, as Ramírez Berg and Valdivia demonstrate in taking up different methodological approaches in more recent work. As Shohat and Stam (1994) and others have noted, specific focus on stereotypes cannot account for the multiple ways in which media narratives impart ideological discourses about the place of Latina/os in the US imagination or give Latina/os subjectivity and a voice. Scholars are now typically engaged in qualitative research beyond questions of the stereotype, for instance through studying Latina/o representation in relation to the social and industrial contexts in which it is produced and consumed and exploring ideological meanings attached to film, television, and star texts.

Racialization and "Latin Looks"

Another central trope within the literature on Latina/o media representation and stardom is that of racial categorization, or racialization,¹⁰ and its relationship to Latina/o mediated imagery. Given the lack of a biological basis for racial categories, media representations and star texts have long assisted in the construction and reification of race in the United States. In the case of Latina/o characters and stars, they have been constructed variously as White or as non-White (or, much more rarely, as racially ambiguous) throughout film and television history, echoing the slippery relationship that Latina/os have held to Whiteness in the United States.¹¹ Scholars thus have interrogated how this dynamic and contradictory history has played out in film, television, and star promotional texts and explicated the social and industrial implications of these constructions.

In one dominant dynamic, opportunities for Latina/o casting and star promotion in US film historically were (and arguably still are) dependent on how closely performers embodied White beauty and body ideals. As scholars documenting Latina/o participation in the industry's early decades noted, even at this stage actors' and actresses' appearance had a determining influence on their careers: social and industry attitudes promoted the hiring of actors with fair skin, European rather than indigenous features, and medium-to-tall, slim bodies (Beltrán, 2009; Ríos-Bustamente, 1992). In this manner, racialized beauty and body ideals dictated the opportunities afforded to Latina/o acting hopefuls: while some light-skinned Latina/os were cast in lead roles – particularly in the late silent film era, as discussed in more detail below – darker-skinned, shorter, and more "ethnic"-appearing Latina/os might be cast as villains or servants at best. Valdivia (2007) updates this research in scholarship on Hollywood's contemporary privileging of the European, in the form of Spanish stars, in recent years.

Class associations notably have also played a role in the racialization of particular stars and characters throughout US film and television history. As Joanne Hershfield (2000) and I (2009) found in analysis of the career of Dolores Del Río, an actress from Mexico who was a film star in the late 1920s through the 1940s, emphasis on her upper-class background in her promotional texts encouraged her public image as an elegant foreigner rather than a racialized Mexican. My research (Beltrán, 2009) on Del Río's career and that of her contemporaries before and after the film industry's transition to sound confirmed also the "cultural racialization" of Latina/o stars in this period. I use the term to describe how Latina/o stars, as their accents could be heard, were racially categorized based on accent, cultural traits, and class markers rather than on their appearance, which often was not so different from that of their Euro-American and European counterparts. Moreover, as I document (Beltrán, 2009), in this era actors like Del Río, now that their accents could be heard, also were no longer considered for roles earmarked as White and were confined instead to Latina/o or other "ethnic" roles, regardless of how fair-skinned they might be. These standards reinforced burgeoning social notions of Latina/os as non-White and perhaps non-American in the more xenophobic climate of the Great Depression. Dolores Del Río herself noted in interviews in the late 1930s that she was increasingly cast in limited roles that capitalized mainly on her abilities as a dancer and were overshadowed by flamboyant costumes, such as the lacy dress in which she was costumed for *Lancer Spy* in 1937. She eventually became frustrated with the situation and in the early 1940s moved back to Mexico, where she quickly became a major film star.

The racial politics of these unwritten casting guidelines thus confined Latina/o performers to limited, typically underdeveloped roles that did little to showcase their appeal or talent. Public and industrial racial notions also dictated that they not portray unambiguously White characters. As Rita Moreno reported in retrospective interviews regarding her years as a young actress in the 1950s, she was often told that she could not audition for a role because they wanted "an American" for the part (cited in Beltrán, 2009, p. 78).

On a related note, in the same years of classical Hollywood in which Latina/os were not considered for White or colorblind roles, the small numbers of more developed Latina/o protagonist roles that existed were at times played by Anglo actors and actresses, apparently based on the belief that Latina/o actors would not draw US audiences in to theaters. Incidences of non-Latina/o actors in what have been termed "brownface" performances (because of the brown makeup often worn by the actors) include Paul Muni as a hot-headed Mexican American lawyer in *Bordertown* (1935), Marlon Brando as the Mexican revolutionary leader Emiliano Zapata in *Viva Zapata!* (1952), and Natalie Wood as Maria, a Puerto Rican woman, in *West Side Story* (1961). Brownface performance is more rare in recent years as it is increasingly viewed as politically incorrect, but it was witnessed as recently as the 1990s with the casting of non-Latina/o actors in such films as *The House of the Spirits* (1993) and *The Perez Family* (1995). Meanwhile, some contemporary Latina/o actors, such as Jennifer

Lopez, Benicio del Toro, and Jessica Alba, have been cast in “White” roles in the last decade, breaking down former casting barriers that Latina/o actors had historically experienced.

The film and television industries’ preferred appearance of Latina/o characters and stars, notably, has also shifted slightly in the last decades. As Rodríguez (1997) and Arlene Dávila (2001) note, film studios’ and advertisers’ preferred “Latin look” by the 1980s came to include a slightly tan skin tone (the better to differentiate Latina/os from African Americans), straight, dark hair, and dark eyes, despite the fact that casting Latina/o and Latin American roles in line with this look negates the actual diversity among Latina/os with respect to phenotypical features, skin tone, and body type. This look still dominates Hollywood expectations; America Ferrera, who is of Honduran descent, is viewed as Latina for casting purposes, while Cameron Diaz, of partial Cuban descent, is not. Building on Rodríguez’s (1997, 2008) work, I also posit in my own scholarship on Latina/o stardom (2009) that we are witnessing a slight widening of the range of preferred Latino looks in contemporary narratives. Valdivia’s research (2007) on the concurrent privileging of European ancestry and appearance, as witnessed in the privileging of Spanish actors such as Penelope Cruz in Hollywood film casting, cautions of limits to this expansion, however.

Further exploring the construction of Latina/o appearance and the racializing function it can serve is scholarship that has begun to interrogate the reinforcement of such ideals by Hollywood through its treatment of Latina beauty and bodies in mediated representation. As I note in research on this topic (2002), Latinas have been given a particular opportunity when a “Latin look” has been considered particularly beautiful – such as was the case for Dolores Del Río and Lupe Vélez in the 1920s and for Jennifer Lopez and Salma Hayek in the late 1990s – and I argue that notions of Latina beauty serve a discursive and often racializing function in mediated culture. This topic has since been taken up productively by other scholars, such as Isabel Molina-Guzmán and Angharad Valdivia (2004), Martha Mendible (2007), and Molina-Guzmán (2010). Molina-Guzmán, for instance, analyzes Latina representation and embodiment in contemporary media culture through case studies that include Jennifer Lopez, the female relatives of Elían Gonzalez, and Salma Hayek in her portrayal of Mexican artist Frida Kahlo in the 2002 film *Frida*.

Constructions of Latinidad and the Question of Authenticity

Another topic central to scholarship on Latina/o representation is how such representation constructs public notions of Latin-ness, or as scholars such as Aparicio and Chávez-Silverman (1997) and Molina-Guzmán and Valdivia (2004) have referred to it, Latinidad. As this survey of scholarship illustrates, Latinidad has been constructed in film and television in distinct and influential ways. In my own research (2009) I

refer to the Latina/o figures and culture created within Hollywood film and television storylines as Hollywood Latinidad, a vision that has evolved in relation to the status of Latina/os within the US popular imagination. Other scholars employ Latinidad to refer also to how Latina/o individuals and communities see themselves and other Latina/os. Aparicio and Chávez-Silverman (1997), for instance, use the plural term Latinidades to refer to the diverse and multiple visions of Latinidad held by Latina/os themselves, while in later scholarship Molina-Guzmán (2010) points to and examines how Latinidad is constructed both within mediated culture and by Latina/os themselves.

A number of scholars have studied and reflected on how Latinidad is constructed through US media representation (and arguably all of the scholarship surveyed in this chapter explores this topic, directly or indirectly); much of this scholarship relates the media representation to the social politics and economic climate of particular eras, to media industry developments, or to the political and economic relationships of the United States with various Latin American countries, among other factors, pointing to the correlations between social climate, media industry agendas, and Latina/o representation. For instance, with a focus on the evolution of mediated Latinidad, in *Latina/o Stars in US Eyes: The Making and Meanings of Film and TV Stardom* (Beltrán, 2009), I explore how Latino/a casting and star promotion have reflected and at times challenged the shifting sociopolitical status of Latina/os, through in-depth examination of the careers and evolving star images of seven film and television stars at differing historical junctures since the 1920s.

As I document (2009), building on the historical research of multiple scholars, including Ana M. López (1991), Ramírez Berg (2002), and Noriega (1992, 2000a), US mediated culture has witnessed a number of “Latin waves,” during which Latina/o and Latin American cultural forms have held particular appeal for US audiences and Latina/o performers experienced greater opportunity and visibility. Such waves emphasized particular configurations of Latinidad, however, that arguably have toed the line of popular racial politics while offering seemingly celebratory versions of Latinidad for US consumption. A case in point is the first such wave that I hone in on (Beltrán, 2009): the open and welcoming star system that Latina/os such as Ramón Novarro, Dolores Del Río, Gilbert Roland, and Lupe Vélez, all from Mexico, encountered in 1920s Hollywood. The popularity of melodramatic films and roles, social tensions over immigration, women’s increasing emancipation, and Italian actor Rudolph Valentino’s success contributed to an interest in darkly handsome and foreign actors with romantic images during this era. These first Latin Lovers became international stars in the mid- to late 1920s, the last years of silent film. They were cast in major roles of all nationalities, but *not*, it should be emphasized, Latin American or Latina/o roles – in this period in which such roles were typically heavily stereotyped. Hollywood Latinidad in this era thus was diverging and ambivalent: Latina/os were typically absent or clearly racialized Others within storylines, while fair-skinned Latina/o stars might have starring roles portraying characters of all backgrounds except Latina/o.

I uncover differing dynamics of Hollywood Latinidad in my case study of Desi Arnaz (2009), Cuban-born musician and actor who acted in films in the 1940s and in *I Love Lucy* in the 1950s and beyond. Arnaz's film career recalls the shifts of the 1940s "Good Neighbor" era, which prompted another rise of interest in Latina/o performers, in this case singers and musicians. In support of the government's Good Neighbor Policy during World War II by which political alliances with Latin American countries were sought, a number of studios produced films set in Latin American locales that supported notions of North and South American friendships, as Alberto Sandoval-Sánchez (1999) and Ana M. López (1991) have also explored. The films produced included biographical dramas and musicals, such as Disney's animated film *The Three Caballeros* (1945) and the Twentieth Century-Fox musical *Weekend in Havana* (1941). Latina/o actors such as Cesar Romero, Lupe Vélez, and Ricardo Montalbán thus experienced opportunities, while several performers with musical abilities were imported to perform in Latin musical numbers and play minor roles. Among the most successful were Desi Arnaz and singer-actress Carmen Miranda, who was born in Portugal but had grown up in Brazil. Miranda, known for her exaggerated costumes and performance style, appeared in such musicals throughout the 1940s. In numbers such as "The Lady in the Tutti Frutti Hat," Miranda came to symbolize the comic, tropical Latina, in a spectacular but trivializing version of Latinidad. Arnaz also experienced success as a leader of Latin bands and in small film roles, particularly because of his skill at translating Latin music and culture for US audiences (Pérez-Firmat, 1994).

Another genre of films that at times presented US Latina/os in relation to social issues they were experiencing, the social problem film, also appeared in the late 1940s and 1950s, providing depictions of Latinidad that stood in stark contrast with the tropicalized Latinidad of the Latin musical. This post-World War II cycle of films emphasized exposing real-life social inequities, and thus presented narratives and images that in many ways challenged previous patterns of Latina/o representation. Some of these films addressed discrimination faced by Mexican Americans in their communities, including *A Medal for Benny* (1945) and *The Ring* (1952). Another, *Salt of the Earth* (1954), produced by blacklisted filmmakers, presented the real-life story of Mexican American miners who successfully went on strike to protest inhumane working conditions, and included the miners in the writing and as actors in the film. As Ramírez Berg (1992) and Noriega (1997) argue in historical studies, these films were distinct in their aim to present Latina/os realistically and with subjectivity.

Such films were fairly rare, however, and their popularity waned as the country and industry became more politically conservative in the 1950s. As I document in my research (Beltrán, 2009), Latina/o actors in the 1950s and 1960s, moreover, often found that their ethnic background was an obstacle to being cast in interesting, well-developed roles. As studios became disinterested in Latin-themed and social problem films, Latino actors and actresses experienced fewer opportunities. Some, such as Mexican Irish Anthony Quinn and Puerto Rican José Ferrer, downplayed their Latin heritage in their publicity. (In later decades, Raquel Welch and Martin Sheen, born

Jo Raquel Tejada and Ramón Estévez, similarly changed their names to avoid type-casting.) Others, such as Rita Moreno, tried to stay true to their heritage; such performers struggled with limited opportunities. Latina/o roles might include juvenile delinquents and gang members in urban dramas such as *Blackboard Jungle* (1955) and *West Side Story* (1961), or bandits in Westerns. One major exception to these patterns was Desi Arnaz, who, with his wife Lucille Ball, starred in and also was executive producer of the series *I Love Lucy* and spin-off productions throughout the 1950s and some of the 1960s, making him the first Latino star and executive in television. As I note (2009), however, he was viewed as a White foreigner and honorary American – particularly in relation to the romantic and relatable image that he and Ball had in the US imagination – rather than as an “ethnic” Latina/o.

More recently, the late 1990s also were trumpeted as a new “Latin Wave” in US popular culture. In this period projections that Latina/os would soon surpass African Americans as the largest non-White group likely influenced views of the Latino audience as increasingly important and influential. The media industries also received important wake-up calls regarding profits to be garnered from successfully promoting Latina/o stars and media texts, particularly in 1995 when music sales skyrocketed after the death of Tejano music legend Selena, a beloved figure among Mexican Americans who became a posthumous star for non-Latinos as well. It is notable that Nuyorican actor Jennifer Lopez got what is considered her breakout role portraying the singer in *Selena* (1997) two years later.¹²

As I document (Beltrán, 2009), Jennifer Lopez’s career prior to and after *Selena* is a testament to how shifting notions of the Latina/o audience and potential appeal to the mainstream provided new and greater openings for Latina/o stardom. Lopez found her first opportunities in Latino and African American-helmed film and television products, including the sketch comedy series *In Living Color* (Fox, 1990–1994), and such films as *My Family* (Gregory Nava, 1995) and *Money Train* (Joseph Ruben, 1995), starring Wesley Snipes and Woody Harrelson. She built on this to then star in mainstream films after *Selena*, ultimately launching a music career, production company, and clothing line in addition to a successful film career. In tandem with this success, Latinidad as constructed through Lopez’s star text was complicated by ambivalent discourses and the deployment of traditional stereotypes even while celebratory, however, such as in the “booty brouhaha” that called attention to Lopez’s purportedly unique derrière in the late 1990s (Beltrán, 2002, 2009). She and other Latina/o performers also were described as “crossover” stars, a controversial moniker given its implication that Latina/os existed outside the boundaries of US culture. The term was heard less by the 2000s, as Lopez has been joined by a variety of Latina/o performers within the realm of US stars.

In relation to Latina/o stars and more generally to study of how Latinidad has been constructed through mediated representation, researchers also have raised questions regarding the authenticity, or the historical and cultural accuracy, of Latina/o characters and star images. Scholars of film and media, for instance, have made note that Latin American cultures have often been conflated in inaccurate

representations in Westerns, musicals, and other Hollywood films, and that stars' performances and images often may not be accepted as authentic by Latina/o viewers as well. For instance, Sandoval-Sánchez (1999), in his analysis of the US theatrical and film careers of Carmen Miranda and Desi Arnaz, raises the argument that their Broadway and Hollywood performances in the 1940s conflated elements of Latin American cultures and submerged the Afro-Latino elements within those cultures to pose an imaginary, inauthentic Latinidad that fit comfortably with popular US notions at the time.

The trope of troubled authenticity has continued to have relevance in relation to Latina/o representation and is echoed in my own research (2009) on comedian Freddie Prinze, who rose to stardom playing the role of Mexican American Chico Rodriguez in the NBC comedy *Chico and the Man* (1974–1978). Prinze's character, notably, was the subject of ongoing debate and negotiation among the producers, the network, and Chicana/o and other viewers in the 1970s. Audience members who complained about the series felt that Prinze, of Hungarian and Puerto Rican descent, was not authentic in his portrayal of Chico and that the role as constructed was denigrating. Prinze, arguably the first Latino television star since Desi Arnaz, appealed in interviews that he was being unfairly judged. Despite the complaints and controversy, a wide audience tuned in to his performances, given the show's ratings. The series became a hit, and Prinze's career may have reached greater heights if it were not for his suicide in 1977.

A number of scholars (including this author) also have addressed the complicated questions related to demands for increased or "non-stereotypical" Latina/o representation. As Valdivia (2010) asks: "Are we asking for more Latina/os that are recognizable as Latina/o? If so, does this mean we need the inclusion of elements that we recognize as Latinidad?" (p. 124). This conundrum – of demanding greater Latina/o visibility but a diminishing of stereotyped images – is increasingly central to contemporary media culture. As such, it has been the focus of the many studies that have explored questions of authenticity and stereotype in the examination of Nuyorican star Jennifer Lopez, for instance.¹³ Given the dearth of Latina/o images in the entertainment media, Lopez and other Latina/o stars carry a heavy burden of representation – or of being expected to stand in for an entire underrepresented community.¹⁴ On the other hand, what is an authentic image, and who gets to decide? The lack of definitive answers to these questions underscores the natural tensions that exist in media representation between cultural marking (establishing that a character is Latina/o), authenticity, and stereotype.

Hybridity and Transnationalism

Also increasingly central to the study of Latina/o media representation is a focus on racial and ethnic hybridity (or *mestizaje*, as Gloria Anzaldúa and other scholars refer

to it¹⁵). Scholars such as Anzaldúa (1987), Valdivia (particularly in 2004, 2008), Gregory Velasco y Trianosky (2003), and Molina-Guzmán (2010) have stressed the importance of hybridity to Latina/o culture and identity, given the history of racially mixed ancestry for Latina/os – even while Latina/o communities may deny African or indigenous ancestry and film and television representation typically posit Latina/os as non-White or White. Media scholars increasingly note that hybridity thus is the constant flip side of racialization, for Latina/os in media representation and elsewhere in US social life. Anzaldúa (1987) claimed in her explication of the New Mestiza (who embraces her heritage in all of its multiplicity) that challenging denial of hybridity, while difficult, could empower Latina/os and all who experience oppression. As Anzaldúa and subsequent scholars have highlighted, Latina/o *mestizaje* has the potential to cross boundaries and disturb racial categories. Researchers, such as Molina-Guzmán (2010), have underscored the danger that Latina/o mediated figures thus pose through calling attention to and embodying the fault lines between racialized and gendered categories.

In my own scholarship I have taken up exploration of the overlap between Latinidad and hybridity in studies that have focused on ethnically ambiguous and mixed Latina/o representation and stardom. While Latina/o stars with European heritage have always been commonplace in Hollywood, given the privileging of White norms of beauty, a more recent development is the rising visibility of performers who have made their mixed heritage central to their promotion. In “The New Hollywood Racelessness: Only the Fast, Furious (and Multi-Racial) Will Survive” (2005), I note the rising visibility of and vogue for mixed-race actors and models, including those of partial Latino ancestry, in US popular culture since the late 1990s and argue that ethnically ambiguous actors and characters constitute a new racial paradigm that is gaining momentum (but with limited impact on traditions of White centrism still predominant in contemporary action films). In “Mixed Race in Latinowood: Latino Stardom and Ethnic Ambiguity in the Era of *Dark Angels*” (2008), I further interrogate such trends in Latina/o representation. Based on comparative analysis of the careers of Jessica Alba and Rosario Dawson, both of partial Latina/o heritage, I conclude that a racially hegemonic cultural imaginary continues to shape opportunities experienced by Latina/o actors of mixed heritage, with Alba given broader opportunities in film roles and in fact more fully embraced within Latina/o communities and by media advocacy groups, presumably because her looks are more assimilable to Whiteness.

An overlapping strand of scholarship calls attention to Latina/o diaspora and migration and transnational media flows in relation to Latina/o representation. In contrast, much of the early scholarship on Latina/o media representation took up its research from the perspective of nation, with respect to the implications regarding national identities and the place of Latina/os within the (North) American imaginary. My own 2009 book title, *Latina/o Stars in US Eyes*, is a vivid illustration. However, in a productive movement some scholars are conceptualizing study of Latina/o representation in relation to the diaspora, the movement of Latina/o audiences, and

global media flows. This is particularly useful given the continuous flow of Latina/o immigrants to the United States in the early part of the twentieth century, primarily from Mexico but in increasing numbers from Central and South American countries since. As recent immigrants join Mexican Americans and Puerto Ricans whose families have been here for centuries, the US Latina/o population is dynamically tied to a global diaspora, with the impact of such transnational ties and movement underresearched elements of Hollywood Latinidad. Recent studies that take up diaspora as a central trope include Maria Elena Cepeda's *Musical ImagiNation: US-Colombian Identity and the Latin Music Boom* (2010) and Molina-Guzmán's *Dangerous Curves* (2010). Among other topics, they trace how Latina/o media texts are produced and consumed in the contemporary era of global media flows and multiple and diverse audiences consuming Latinidad. An apt illustration is one of Molina-Guzmán's (2010) case studies, the construction of Mexican artist Frida Kahlo for Latina/o and non-Latina/o, US, and international audiences in the film *Frida* (2002), with Salma Hayek standing in for Kahlo through multiple, competing discourses. Television series like *Ugly Betty* (ABC, 2006–2010), an adaptation of the Colombian telenovela *Yo soy Betty la fea* (1999–2001), also mark shifts taking place in the source and impact of Latina/o representations in relation to transnational media flows and global audiences.

Self-Representation and Participation in Mainstream Media

In relation to and at times in conjunction with scholarship that has explored Latina/o representation and stardom, researchers also have pointed to the importance of Latina/o employment within the media industries, particularly as writers and producers. A 1999 Tomás Rivera Policy Institute study (Pachón, DeSipio, de la Garza, & Noriega, 2000) commissioned by the Screen Actors Guild (SAG) found that most Latina/o actors experience obstacles to securing agents and finding employment. In 1998, Latina/os comprised only 4.3% of total SAG membership, worked only 2.9% of total work days, and were cast in supporting rather than leading roles far more than White or African American actors. Latina/os also are largely absent from media industry and talent management executive circles (Noriega, 2000b). The professional guilds for writers, actors, directors, and producers now report statistics regarding diversity in their ranks, while media advocacy groups such as the National Hispanic Media Coalition and journalists regularly note the continuing dearth of Latina/o writers, producers, and executives in television. An assumption of such efforts is that Latina/o media producers will be mindful of including Latina/os in media narratives and more accurately and fairly represent Latina/o characters and culture, an outcome that is not guaranteed, however.

Until the 1970s and well into the 1980s, moreover, Latina/os in the United States typically did not have access to training or support to become film and television producers within the mainstream media industries. Importantly, as Noriega (1992, 2000a) and other scholars of early Chicana/o and Puerto Rican film document, Latina/o media production has its roots in civil rights activism, and specifically the Mexican American and Puerto Rican movements, which reached their zenith in the late 1960s and early 1970s. It was during this period that the term Chicano (and, for women, Chicana) began to be embraced as a label of pride by Mexican Americans. Given that many of these Chicana/o and Puerto Rican activists were the first generation to have been raised on television, their activism also often included awareness of the power of media images and of the need for creative control in their production.

As Noriega (2000a) notes, battles over media representation in this period were fought on two fronts by Chicana/o and Puerto Rican activists. Latino media advocacy groups, such as the Council to Advance and Restore the Image of Spanish-Speaking and Mexican Americans (CARISSMA), the Puerto Rican Action and Media Council, and Justicia, also known as Justice for Chicanos in the Motion Picture Industry, protested media images that were seen as denigrating and demanded training opportunities for Latina/os in the television and film industries. In addition, some Latina/os began producing short films and public affairs television series in conjunction with their activism. These films and programs are considered the first wave of Chicano and Puerto Rican cinemas; early activist-filmmakers included Moctesuma Esparza, Sylvia Morales, Jesus Salvador Treviño, Luis Valdez, and Bení Matias. As scholars of early Chicana/o and Puerto Rican film such as Noriega, Rosa Linda Fregoso (1992), and Lillian Jiménez (1998) have documented, such self-representation and the Latina/o media producers to follow in later generations importantly complicate notions of Latinidad and of diversity within Latina/o communities.

As a result of these entrances, Latina/o filmmakers began to produce feature films and have an impact on Hollywood's construction of Latinidad by the 1980s. A number of these films were distributed nationally to respectable critics' reviews and box office.¹⁶ They included Luis Valdez's *Zoot Suit* (1981) and *La Bamba* (1987), Gregory Nava's *El Norte* (1983), Cheech Marin's *Born in East L.A.* (1987), and Ramón Menéndez's *Stand and Deliver* (1988),¹⁷ and were joined by the first wave of films by Cuban directors who now lived in exile in the United States, such as León Ichaso and Orlando Jiménez Leal's *El Super* (1979) and Ichaso's *Crossover Dreams* (1985). True to common assumptions of the impact of self-representation, these films offered Latina/o (and particularly male) characters with cultural specificity as well as with subjectivity and dignity. As a result, they catapulted a few to stardom, such as Mexican American actor Edward James Olmos, who portrayed El Pachuco in Luis Valdez's *Zoot Suit* and teacher Jaime Escalante in *Stand and Deliver*, and Puerto Rican Esai Morales, who played Richie Valens in *La Bamba*, as I note in my research (Beltrán, 2009). A number of Latin American actors also were cast in starring roles in other Hollywood films in this period; they included Cuban actor Andy Garcia, Irish Cuban Mercedes Ruehl, and Maria Conchita Alonso, a Venezuelan of Cuban descent. Curiously, the success of

this handful of films and stars led the news media to dub the 1980s the “Decade of the Hispanic” in 1987. In the press coverage, Olmos also was promoted as the primary star and as a symbol of Latino visibility in US popular culture. In interrogating this promotional focus for these films and for Olmos, I found (Beltrán, 2009), building on the work of Kathleen Newman (1992), that it constructed this slight rise in Latina/o visibility as unthreatening to the US status quo. Given how Olmos in the 1980s portrayed decidedly ethnic characters that fought within rather than against the system and was known as a champion of the oppressed in his public appearances, his star image did not threaten to displace the traditional, White Hollywood hero or hierarchies within the US imagination.

With respect to Latina/o self-representation, a greater diversity in the types of stories and characters has emerged in Latina/o-themed film projects since the 1990s, reflecting the divergent interests of the newest generation of Latino and Latina filmmakers and their presumed audiences. Successful films with Latino themes and main characters since the 1990s include *Real Women Have Curves* (2002), directed by Columbian filmmaker Patricia Cardoso, and *Quinceañera* (2006, Richard Glatzer, Wash Westmoreland). A number of new actors and actresses have found success and stardom as a result. In recent years, Latina/o-themed films are rarer while Latina/o actors are often integrated into diverse ensemble cast projects, as is the case for the television series *Ugly Betty*, shifts that call for new and targeted study.

Conclusion: Contemporary Trends and Research Questions

Can we envision another way of representing Latina/os? And does this actually amount to assimilation or a new hybridity of being? These are questions we might need to remember as we continue our analysis and resulting activism.

(Valdivia (2010, p. 124))

The present day is one in which multiple and competing trends in representation of Latina/os beg further critical examination. In the 2000s, the roster of Latino/a actors with name recognition among non-Latinos and Latinos alike has grown, as actors such as America Ferrera, Michael Peña, and Selena Gomez are joining the likes of Edward James Olmos and Jennifer Lopez in the public imagination and a few Latina/os for the first time are considered international box office draws. Latinas are being posited as protagonists in children’s programming, such as in *Dora the Explorer* (Nick Jr., 2000–), *The Wizards of Waverly Place* (Disney Channel, 2007–), and *Camp Rock* (Matthew Diamond, 2008). We are witnessing a greater nuance at times in Latina/o representation and the rise of a handful of Latina and Latino writers and media producers, even while denigrating images have not disappeared altogether.

The visibility and apparent popularity of Latina/o actors and characters today illustrates both how marketable Latinidad now is and tensions therein (Molina-Guzmán, 2010). Given these trends, some scholars are exploring the increasing “Latinization” of US culture as Latina/o culture and stars become more popular and integrated, to differing conclusions. Molina-Guzmán (2010), Valdivia (2008, 2010), I in my own work (Beltrán, 2009), and other contemporary scholars importantly draw attention to the multiple implications of such hypervisibility. These scholars remind us that this also entails the inclusion of contradictory discourses that reaffirm Latina and female disenfranchisement in national and global culture, particularly as Latina/o immigrants are scapegoated for US social problems and xenophobia is on the rise, pointing to the need for further in-depth study of such multivalent representation and its impact.

NOTES

- 1 The terms Latino (and the more gender-encompassing Latina/o) and Hispanic are both used to varying degrees in different regions in the United States to refer to people whose ancestry can be traced to Latin American countries. Hispanic, a term coined by the US government in the 1980s that makes reference to Spanish ancestry and the Spanish language, is used decreasingly, however, in favor of Latino, which privileges geographic reference and acknowledges indigenous and mixed ancestry.
- 2 For more information on this time period and Mexican American history more generally, see Rodolfo Acuña (2000).
- 3 See US Census Bureau, *The Hispanic Population: A Census Bureau Brief* (2001), at <http://www.census.gov/prod/2001pubs/c2kbr01-3.pdf>.
- 4 Second- and third-generation Latina/os in particular typically consume both English and Spanish-language media (Johnson, 2000).
- 5 See Jennifer M. Ortman and Cristine M. Guarneri, US Census Bureau, *United States Population Projections 2000 to 2050* (2009), at <http://www.census.gov/population/www/projections/analytical-document09.pdf>.
- 6 A small number of Latina/os of privileged backgrounds were involved in film production prior to the transition to sound film, however, as Ríos-Bustamente (1992) documents regarding the silent film era.
- 7 Commercial television networks began producing and broadcasting narrative programming in the United States in the last years of the 1940s, while it spread more widely and more Americans watched television regularly in the 1950s.
- 8 When stardom is viewed in purely economic terms, film and television stars are defined as those actors whose popular appeal is such that they can draw in viewers based on their name alone. Stars with such demonstrable appeal to draw in viewers to movie theaters or to watch a television series are considered to be “bankable” and serve as driving forces for media production.
- 9 Gaye Tuchman (1978), describing how women were represented in the mainstream media in that period, coined the term symbolic annihilation to describe these dynamics. She broke this down further to three distinct processes: omission, trivialization, and condemnation.

- 10 Racialization, a term coined by Omi and Winant (1986), is the process by which racial categories and related associations have been constructed and reified through social institutions, including the entertainment media, and social history.
- 11 Confusion still exists regarding whether Latina/os are a race or an ethnic group. While Latina/os are not considered a separate race by the government, they are a racialized ethnic group, viewed as non-White in the popular imagination.
- 12 The term Nuyorican refers to an individual born in New York and of Puerto Rican heritage.
- 13 Focus on Jennifer Lopez has been so prevalent in recent scholarship that Valdivia (2010) singles her out as a case study running at the end of every chapter of her overview of Latina/o communication studies to discuss the trend; among the scholars who have analyzed the representation of Lopez at some stage of her career are Frances Negrón Mutaner (1997), Barrera (2002), Aparicio (2003), Molina-Guzmán and Valdivia (2004), Valdivia (2007), and myself (2002, 2009).
- 14 The dynamics of the burden of representation are explored by scholars such as Shohat and Stam (1994) and can be traced back to early writers on African American representation such as James Baldwin (1968).
- 15 *Mestizaje*, a Spanish word, refers to mixture or mixing; it has commonly been used to describe racial mixing in Latin American countries. Gloria Anzaldúa (1987) made the term central to her scholarship on the progressive utility of embracing submerged elements of Mexican American heritage and marginalized people within communities.
- 16 As Henry Puente (2004) reports in research on the distribution of US Latino films in the 1980s and 1990s, this involved many missteps on the part of US film studios and distribution companies, however, particularly regarding how to best market films to Latina/o audiences and the mainstream public.
- 17 Latina filmmakers, while they did exist in this period, tended to produce short films outside the Hollywood system, as Fregoso (1992) explicates on Chicana media production.

Queer Gazing and the Popular

A Study on the Representational Strategies of Queer Representations in Popular Television Fiction

Sofie Van Bauwel, Frederik Dhaenens, and
Daniel Biltereyst

ABSTRACT

In this chapter, we elaborate on the construction of queer representations in popular television fiction. In spite of the critical and commercial success of “queer” television fiction series (e.g., *Queer as Folk*, *The L Word*, *Six Feet Under*), queer representations are sometimes still seen as controversial. The aim of this chapter is to obtain a better insight into the social and emancipating role of queer representations in contemporary popular culture. A theoretical integration and a translation of the concept of queer theory offer a conceptual framework for this study on media representations. In particular, this chapter relies on this framework for the analysis of television as a popular discourse machine in relation to the production of queer representations in global popular television series. Our textual analysis stresses the different strategies of queer representation in popular television fiction. We discuss the potentiality, limits, and restraints of this diversity of strategies and explore the limits of representing queer within the realm of contemporary popular culture.

Contemporary Western society is dominated by a media culture (Featherstone, 1995; Kellner, 1995). Besides printed media, radio, and information and communication technologies (ICTs), television is still an important medium in the realm of everyday life. Fiction, and especially fiction series, is ubiquitous in this Western television world, and broadcasters travel around to buy not only formats but also fiction series. Several studies with an emphasis on the political economy of the global media market (e.g., Chalaby, 2006; De Bens & De Smaele, 2001) have stressed the importance of importing fictional television formats. In this respect, Biltereyst (1995) has already argued that the European market is dominated by North American (i.e., US) fiction. European channels have gained success with fiction series such as *24*, *Lost*, *Heroes*, *Prison Break*, and *Sex and the City*.

Recently, television series that predominantly represent queers have also entered the international television market. In this chapter, the concept of “queer” refers to those who do not consider their sexual identity and/or desires as strictly heterosexual, and/or who articulate sexual and gender identity positions that are considered as diverging from the heteronormal. Hence, queer representations can have the potential to challenge heteronormativity and/or heteronormative representations of lesbian, gay, bisexual, and transgender (LGBT) characters and articulate queer identities.

To this end, we illustrate how potential queer strategies are articulated in popular television series. In particular we focus on *Queer as Folk*, *The L Word*, and *Six Feet Under*, since these series on the one hand represent characters who transgress fixed identity positions and, on the other, subvert and/or depict alternatives to certain heteronormative institutions, practices, norms, and values, unlike *Will & Grace* (see Provencher, 2005). These series are not only popular on television but are also successful (like many other series) on the DVD market. *The L Word* was broadcast in 44 countries, *Six Feet Under* in 22, and the original British *Queer as Folk* in 16 countries, quite comparable with, for example, the popularity of *Sex and the City*, which was broadcast in 39 countries.

It should be noted that the increase of LGBT representation on television began in the late 1990s. Prior to that time, LGBTs on the small screen were rarely present. In contrast, cinema and Hollywood have always represented LGBT and queer characters (Dyer, 1990). Even during the era of the US Production Code, subtextual articulations of queerness were depicted on the big screen (Barrios, 2003). (From 1934 until 1968, Hollywood installed the Production Code Administration (PCA) as a self-regulatory institution that provided self-censorship rules.) Among other constraints, the PCA forbade depictions of sexual perversion. From the 1950s on, LGBTs did enter the small screen, albeit as sidekicks who very often had to be “cured” of their “sexual deviancy.” During the 1980s and 1990s, most of the series exchanged the pathological queer for a more mainstream gay character. However, series that are explicitly defined as queer by their producers are a recent phenomenon within Western media culture. As such, fictional texts are created that are positioned outside the borders of heteronormativity (Hayward, 2000). This practice very much corresponds with some of the basic premises of queer theory, the poststructural theory that contests strict categorical views on

gender and sexuality (Seidman, 1996). These series represent characters whose gender and sexual identities are blurred, paradoxical, and undefined. Further, these series expose and deconstruct the way mainstream Western society reiterates and consolidates the hegemonic discourse of heteronormativity, for instance by questioning the hierarchical supremacy of certain institutions (e.g., marriage), practices (e.g., procreation), and norms and values (e.g., monogamy, stability, longevity).

Even without production intentions, these explicit queer representations are preoccupied with “alternative” representations of identity and sexuality. Besides the fact that the signifying practices in relation to these representations are multilayered and not fixed, we want to explore the representational strategies that are being used to depict the British and North American queer characters in fictional series like *Queer as Folk*, *Six Feet Under*, and *The L Word*. Elaborating on queer theory, we will analyze these media texts and stress the different representational strategies of queer identities in popular television fiction. These series are interesting to research not only for their queerness, but also because they are present in the contemporary international DVD market and gain large audiences in Western broadcasting media.

Mapping Queer Theory

The roots of queer theory can be found in the late 1970s when the concept of homosexuality began to be questioned, a phenomenon that radically changed gay and lesbian studies (e.g., Creekmur & Doty, 1995).¹ At that time within academia and grassroots movements in particular in Western countries, homosexuality began to lose its essentialist and uniform connotation while homosexual desire came to be positioned in a social and historical context (for an overview, see Seidman, 1996). Still, it is important to state that essentialist notions of homosexuality are still predominant in Western mainstream societies and that queer thinking in academia and activism is not a unified endeavor. Gradually, class, race, ethnicity, and nationality were integrated into the debate about identity (Seidman, 1995). Social constructivism was the dominant approach or paradigm within which identity and sexual orientation were discussed from historical and cultural angles, from which emerged two important principles. The first was that socially recognized sexual orientations vary culturally and historically; the second suggested that in cultures where heterosexuality and homosexuality are acknowledged, sexual behavior can move between these categories or incorporate both (McIntosh, 1997). As a consequence, unified values or political aspirations were rendered practically impossible because of the diversity within the queer community (Seidman, 1995).

At the same time, in feminist film theory contradictions were revealed. Research on different feminisms focused on changing the structure of patriarchal societies in order to end the oppression of women and minorities, which in the 1970s experienced a theoretical transformation into film studies (Chaudhuri, 2006). In this context the

accomplishments of feminist film theorists were of great importance (for example, Laura Mulvey's (1975) groundbreaking essay on questioning the male gaze in cinema). But what seemed to have been overlooked by both the British and the American traditions of feminist film critiques were the "real" women. Teresa de Lauretis (1987) pointed out that feminist theory continued to think in terms construed by patriarchies, creating women as a universal sex category opposed to that of men (see Benhabib, Butler, Cornell, & Fraser, 1995; De Vos & Van Bauwel, 2002), making differentiating between "women" and "Woman" impossible. Such a differentiation required a radical rethinking of the very concept of gender. Founded on Michel Foucault's technology of sex (1976), de Lauretis suggested that there is a technology of gender that is the product of hegemony. This enabled research in which men and women were analyzed in relation to power strategies rather than merely in relation to one another. Judith Butler (1999) also reacted against the assumption of women having a common identity, in the sense that at certain moments in time and place common goals and/or aspirations are articulated as shared and even universal in relation to women's emancipation building on a common identity as a woman. Although this insistence was constructed within feminist movements and theory to challenge patriarchy in the context of women's emancipation, the conformance to the boundaries of representational politics promoted exclusion and misrepresentation. Butler suggested a radical rethinking of the ontological constructions of gender and identity within the frame of feminist political practice. Butler (1999), who is considered to be one of the leading queer theorists, raised the issue that is foremost in communities of women and LGBTs, namely, the importance of understanding how categories such as "women" or "gays" are produced and reiterated.

Besides the fact that there is a diversity within queer studies and despite the overlaps and interrelatedness with lesbian and gay studies, queer theorists share a concern with how some lesbian and gay scholars try to legitimize homosexuality as a sexual minority by positioning it within the binary construction of homosexuality versus heterosexuality, and by disregarding the hegemony that regulates and reiterates this framework. As a result, these minorities remain conceptualized as the opposite extremes in a spectrum where the center is intact. Queer theory is about reacting against these normalized hierarchies and identity politics, conducting research outside the boundaries of predefined gay or lesbian communities (Seidman, 1995; Stein & Plummer, 1996). The concept of resistance is at the core of queer theory. It is a conscious refusal of labels that define what it is against and it emphasizes a retreat from binary thinking (McIntosh, 1997), which is why queer theory embraces all "non-normative" identities relating to the need to revise society's assumptions about gender and sexuality (Hayward, 2000). In this context, Steven Seidman (1995) is correct to suggest pushing the hetero/homosexual opposition from the individual to the cultural level, and to formulate it as a category of knowledge that encompasses the possibility of imagining homosexuality at the center of popular culture and society, which also exposes the emphasis on heteronormativity. Larry Gross (1998) makes similar claims in his work on sexual minorities and the media, arguing that

audiences – and especially minority audiences – can read media texts “as if,” reversing the hegemonic meanings embedded in them.

Queer theorists draw on French poststructural theory, its methods of deconstruction, and Foucault’s legacy, particularly his views on power/knowledge and the history of human sexuality (Lapsley & Westlake, 2006; Seidman, 1995). A characteristic of poststructural theory is its rejection of a total theory, which implies that texts can be approached from multiple perspectives focusing simultaneously on discourses and non-discourses, uncovering multiple signifiers such as context, intertextuality, and different subject positions in addition to the text itself (Hayward, 2000). Many poststructuralists use deconstruction to analyze the signifiers and to unravel the modes of representation in a text. Deconstruction is a mode of reading against the grain (i.e., not a method) that is aimed at attacking the ideological values of hegemonic institutions by revealing the illusions being created in a text (see Derrida, 1987). According to Seidman (1995, p. 25):

It is the rendering of literary analysis into social analysis, of textual critique into social critique, of readings into a political practice, of politics into the politics of knowledge, that makes deconstruction and the queer theory inspired by it an important movement of theory and politics.

Finally, queer theorists are heavily inspired by Foucault’s (1980) view on power as a possibly repressive and productive factor. Power is not only repressive and disciplinary (from above and institutional) but can also produce agency within the subject (i.e., individual subjects). Broadly, agency can be considered as a discursive construction that produces power. The merit of Foucault’s concept of power lies in his linking of power and the discursive position of resistance, in which resistance is allowed to expand and to be articulated as a reflection of power relations. The risk of this perception, according to Mark Thorpe (1999), is that when emphasis is laid on the social factor a pessimistic view is created, meaning that resistance and change are almost impossible in the praxis and only take place at a theoretical discursive level. The introduction of discursive articulations of resistance gives power to each social actor, and the inequalities in the power relations might be overlooked. Thorpe rightly argues that valorizing the margins as progressive spaces of resistance can lead to problems in the attempt to turn theory into empirical evidence. Based on his own research, he makes some suggestions about how to (re)consider the “margins of resistance.” Thorpe (1999) says that these margins of resistance can be seen as both “something” and “nothing,” “there” but “nowhere” as one shifts between lived views, imaginative presentations, and localized structures of validity and meaning. This theoretical insight is particularly fruitful for media and film studies because of its nonromantic and nonidealistic view on the concept of resistance.

Resistance can be present in contemporary representations but at the same time these are incorporated by the boundaries of contemporary mainstream popular culture. There is an opportunity and a potential space for resistance but it is incorporated

in mainstream media, and the optimistic notion of pleasure and resistance within media studies is left behind. Furthermore, Foucault (1976) suggests that there is no essential truth of human sexuality as each time it is reconstructed in society's discourses where different sexualities are produced. The fluidity within sexual identity implies that queer theorists find it pointless to conduct a politics of identity in the name of repressed sexualities that can become new sexualities in the future; rather, they prefer to focus on how subjects construct their sexualities in relation to the mechanisms of power and knowledge (Dunphy, 2000; Lapsley & Westlake, 2006).

Queering Academia

Studies of representation are no longer served by the "screen tradition" – film scholars who emphasized the role of film as a text and who were once indispensable to research on cinema (e.g., Gove, 1996). Jeff Lewis (2002), for example, criticized the screen tradition for being concerned mainly with the subject and how it relates to the text. In a similar vein, Ien Ang (1991) criticized screen theorists' textual determinism or their focus on the text as the main source of meaning, thereby ruling out the text readers. According to Ang, readers are able to offer different interpretations of the same text. The noble goal of creating a unified theory of signification, ideology, and subjectivity had become unachievable (Lapsley & Westlake, 2006).

Even with this limitation in mind, we argue that the first step in deconstructing and unraveling these contemporary queer representations is embodied in a textual analysis of these fictional series, more specifically of the queer representational strategies, without falling into the passive "spectator trap" of film theory. The deconstruction of the represented queer identities is conceptualized by work on identity that is part of the active viewer paradigm that challenges textual determinism and conceptualizes the viewer assuming an active role within the signifying practices. This implies that both the text and the audience give meaning to identities such as class, sex, ethnicity, and nationality (Stacey, 1994). This conceptualization embroiders on Hall's fundamental work on the theory of identity (see Hall, 1992, 1996, 1997), which postulates that identities are discursive constructions that produce subjectivities with meanings that are fluctuating in time and place. Rosemary Hennessy (1995) valued cultural studies because of "the intellectual's commitment to and articulation of the relationship between theory and practice." She stressed that what distinguishes cultural studies from film studies is the scarce acknowledgment within film theory at the beginning of the 1990s of race, class, sexuality, and ethnicity, or the role of gender in these concepts (Hennessy, 1995, p. 22). The interdisciplinary field of cultural studies has much stronger ties with activism and notions of exclusion, diversity, and inequalities are much more prominent in its work. One could argue that gender gained recognition in feminist film theory; however, even here some theorists did not include race, class, sexuality, and ethnicity and focused solely on the construction of "woman" (Chaudhuri, 2006). If we consider Henderson's (1995) remark on the ease

with which cultural studies transgresses disciplinary borders, it becomes clear how comfortably queer theory can be merged into it. The need for this is accentuated by Lapsley and Westlake (2006) in their *Film Theory: An Introduction*, which described how postmodernity in all its diversity demands different approaches and methods. The authors stressed that “it is hard to see how anyone could now plausibly advance claims for the universal validity of a particular orientation while delegitimizing all others” (Lapsley & Westlake, 2006, p. xv).

It is not only film and cultural studies that benefit from queer theory, but queer theory itself becomes more viable when its theoretical stances are integrated into film studies or cultural studies, both of which include research on LGBT and queer representation. Although queer theory engages in the promotion of individuality and celebration of differences, it never fully explains the type of difference politics it envisions. Seidman (1995) even suggested a conscious refusal on the part of queer theorists to formulate ethical and political points of view or imagine a constructive social project. Seidman (1995) referred to Judith Butler and her suggestion to expose and undermine the compulsive reenactment of heterosexuality and the assumption of causality between sex, gender, and sexuality by means of deconstructive critiques such as drag or performative politics (see also the work of Halberstam, 2005; Edwards, 1998).

Besides the theoretical emphasis on performance and subjectivity, it is important to link these almost ontological positions to the ideological and emancipatory positions of research on queer representations. The critique that there is no solid ground for subject positions could be countered, possibly by applying queer theory to research LGBT representations. Specifically, a queer theoretical perspective allows for highlighting the resistant potential of queer representations to expose or disrupt the hegemonic heteronormative discourse.

Recognizing and identifying these articulations would facilitate the formulation of constructive social practices. As such, queer theory could become an element of research aiming at concrete, constructive ethical points of view.

Putting the Queer into Media Studies

The integration of queer theory into film studies resides in a small but significant number of essays regarding queer film production and reception (e.g., Gittings, 2001; Rich, 2004; Wallace, 2000). Researchers mainly depart from the key idea of queer theory, which is a rejection of the biological and essentialist notions of gender and sexuality, perceiving them as fluent and socially constructed. Harry Benshoff and Sean Griffin (2004), for instance, emphasized that queer film research aims at exploring all non-normative sexualities and how they relate to the screen. The possibility of broadening the spectrum beyond gay and lesbian identities makes it possible for scholars to embark on the practice of queer reading (e.g., Cover, 2000). Apart from Alan Sinfield's (2004) queer readings of literature, one of the first queer readers of

texts was Eve Kosofsky Sedgwick (1985). In *Between Men*, Sedgwick reread English literature to expose discriminations and contradictions in what she called “homosocial desire,” a continuum between the homosocial and the homosexual. In doing so, she reacted against the opposition of the latter two as separate categories. She found this opposition to be less emphasized among women than among men in current society. This difference in emphasis contrasts to Athenian societies, which recognized the homosocial continuum among men. For this reason, she suggested that research on sexuality should be conducted in relation to historical power relationships (Sedgwick, 1985, pp. 1–5), a perspective that has been adopted by queer film theorists in some of their essays on gender and sexuality. Caroline Evans and Lorraine Gamman (1995) put great effort into revisiting gaze theory. They reviewed it in relation to queer theory and referred to the debates over identification in cinema that raised (still unanswered) questions about gender and identity. The problem lies in the concept of identity, which sneaks in and prevents queer reading from being detached from the identification practices in the queer gaze. Although the authors quite firmly argue that identification is fluid and constructed, their idea seems to be approaching the linear “natural” and “essential” bounds of queer reading and identification.

Alexander Doty is another prominent queer film reader who has formulated in a more balanced way propositions in the spectatorship paradigm within film studies. According to Creekmur and Doty (1995), reading practices can vary from revealing queerness in popular culture by questioning the role of mainstream culture and its preferred readings to reinscribing queerness at the margins of popular culture and positioning queer and queer readings on the scholarly agenda of research into popular culture. Doty – well aware of the irony of the subtitle of *Flaming Classics: Queering the Film Canon* – stressed that the practice of queer reading should not be interpreted as making texts queer, but rather as trying to understand how texts might be understood as queer (Doty, 2000). Robert Lang (2002) also gazed at Hollywood through a queer looking-glass and discovered hidden homosocial and homosexual bounds in films such as *Batman and Robin* (1997), *Midnight Cowboy* (1969), and *The Outlaw* (1943). The latter is a Western that features the character of Doc Holliday falling in love with Billy the Kid.

The flexibility of the concept of queer makes it possible to understand almost any film as queer to a greater extent than standard lesbian or gay films. Doty (2000) referred to classic Hollywood films such as *Thelma & Louise* (1991) or *Gentlemen Prefer Blondes* (1953), in which he recognized the creation of an unstable space between the same-sex leads that leaves room for all sorts of interpretations (see also Doty, 1995). Put otherwise, it enables us to read and expose non-normative sexual desires that remain concealed within the heterocentric and stereotyped way of watching films and other popular culture products. It also exposes how LGBT characters are only recognized as such when they are portrayed in clichéd and often pejorative ways (Doty, 2000).

The concept of representation looms in every queer reading, although approaches to it vary. Researching queer representation in a historical context involves considera-

tion of the political and social contexts in which these films were made and seen. North American films that were made in the 1940s and 1950s, when the Production Code (which forbade references to sexual perversions such as homosexuality) was in force, had to find ways around it to enable the representation of gay and lesbian characters on screen (Barrios, 2003). Queer reading practices that focus upon contemporary culture either regard the representation of gay- or lesbian-identified characters or work on queering popular mainstream cinema (see Dhaenens et al., 2008). David Gauntlett (2002) falls within the latter tradition, although he regards queering texts as inventing alternative readings that the authors did not intend and most audiences do not recognize. The body of queer film studies is a diverse package of possible readings of queer and non-queer movies in which the spectator is a mere construction in the mind of the author. Doty (1995, p. 77), for instance, talked of already queerly positioned viewers and straights, both of whom are assumed to be prone to queer impulses. It is therefore important to look at the text and the representational strategies before making arguments about the reading and possible alternative readings. Yet, media studies and screen studies could benefit from the insights and theoretical conceptualizations of queer theory, especially when analyzing queer representations.

Textual Deconstruction

In discussions on queer reading, the dominant voice is that of the queer scholar, while media producers and audiences are often overlooked. Most of the scholars are doing significant theoretical work, but the academic queer gaze shifts from theory to audience and the text is often forgotten. Using a textual analysis (Van Bauwel, 2005) based on the tradition of film analysis, in this chapter we distinguished several representational strategies when a queer identity is represented in popular television fiction. We analyzed moments of queer identity by the characters in the series *Queer as Folk*, *The L Word*, and *Six Feet Under*. Therefore, we analyzed two different levels of the series' textual signifying practices – narrative (e.g., characters, actions, space) and cinematographic elements (e.g., camera movement, lighting, editing). The latter category was divided into aspects of the image (camera use, light, color use, juxtaposition) and aspects of sound (music, spoken language, natural sound, on screen or offscreen). Together, these elements create the *mise-en-scène*, which gives meaning to the articulated queer identity.

Queering Television

For this study, we focused on three series that feature queer characters and/or are described as queer series. First is the American family drama series *Six Feet Under*

(HBO, 2001–2005), which revolves around the Fisher family that has lost its paterfamilias and is left with the father's funeral home. One of the sons is David Fisher, a closeted gay man who has a relationship with Keith Charles. Second is the British drama series *Queer as Folk* (BBC, 1999–2000), which features a tightly knit group of predominantly gay friends in a contemporary urban environment. The final series is the American drama series *The L Word* (Showtime, 2004–2009), which focuses on the lives of a tightly knit group of primarily lesbian friends in contemporary Los Angeles. The series *Queer as Folk* and *The L Word* can be considered queer by “nature.” Even though many of the characters label themselves as, for instance, gay or lesbian, most of them can be considered queer. Further, these series depict a queer community in a cosmopolitan environment. *Six Feet Under* differs, aside from the fact that some of the main characters are queer; its focus is not on a queer community and most of the time the thematic scope is not queer-related (which is the case for the other two series). However, besides a diverse and rich set of characters, these series share some common strategies for representing a queer identity. Most of the strategies can be situated at the narrative level since these series can be described as a narrative genre where plot and character development are important elements of the genre conventions. Thus, our textual analysis focused on the plot and characters.

We distinguished the following five strategies: parody, strategies of corporeality, strategies of “matrix” reversal, strategies of role reversal, and strategies of rearticulation through discursive pleasure. They were all manifested in different forms and equalize at a certain point the representational strategies that are used to represent gender benders (Van Bauwel, 2005).

The queer manifestations articulated by *parody strategies* are often very strong representations of stereotypical queer representations (e.g., the stereotype of the overemotional queer or the butch lesbian) and are articulated through cross-dressing, overacting, and travesty. Especially in the series *Queer as Folk*, these strategies are used and often indicate the construction of gender identities and gender roles. This articulation situates itself foremost within the actors' codes (such as vestimentary, gesticular, and kinetic). Parody, often in the guise of self-irony, results in the excessive use of mimetic codes that produces an identity solely constructed out of stereotypes. There is also a temporary simulation of an extreme stereotypical gender identity, and the actual gender identity is not lost, although the fixed identity disappears. For instance, the effeminacy of the stereotypical gay character Alexander in *Queer as Folk* (season 1, episode 3) is exaggerated in such a way that what becomes mocked is the process of stereotyping instead of the character. Similarly, the series parodies heteronormative gender roles, for instance through characters systematically calling their male friends “girlfriends.” This strategy can be seen as a form of resistance, but it seldom makes a clear statement of resistance against dominant heterosexual identities. In addition, this strategy does not articulate a clear “agency.”

The *strategies of corporeality* emphasize the performance of the protagonist. The material body reflects the “other” gender identities or articulates an ambiguous gender identity, sometimes called the androgynous ideal. Often “agency” and active identity

construction are present. These strategies are also mainly articulated through the actors' codes, such as kinetic codes under the guise of a masquerade. For instance, in *The L Word* these strategies can be seen as a form of criticism of a fixed gender identity. The series features Shane, a character who articulates androgyny in multiple ways. She claims a lesbian identity, which signifies a female subjectivity while nonetheless playing with both masculine and feminine codes. In contrast, Max opts more radically for a male identity, by embodying masculine stereotypes and pursuing a bodily reconfiguration from female to male. Still, both characters resist the notion of fixed identities that are based on causal relations between chromosomal sex, gender, and sexuality. However, this is a much more subtle strategy, where the cinematographic representation remains hegemonic and one often adopts a "male" gaze. In particular, *The L Word* has earned criticism because of the "heterosexual lusty gaze" embedded in the series; Candace Moore (2007) has referred to the "tourist" gaze where the male heterosexual viewer is looking into the lesbian world of West Hollywood. Nevertheless, this strategy can be interpreted as a form of resistance that is largely incorporated and often partial. For instance, in the pilot episode, new neighbor Jenny is peeping through a wooden fence at two women making love in the neighbors' swimming pool. Although this scene is constructed around the male gazing lustfully after two lesbian women, it assumes a female subject position through Jenny's gaze. Thus, it resists the stereotypical image of the male gazing and subject position.

The strategies of "matrix" reversal, on the other hand, depart from a more radical position. In these strategies, queer is articulated as the norm, hegemony is transformed as queer, and heterosexuality is reallocated to the margin. The role reversal and the ambiguous game are articulated by the number of queer characters, and by the camera perspective with which the spectator mostly identifies and which is equal to the protagonist's view. Both *Queer as Folk* and *The L Word* depart from an almost exclusive queer site that is constructed as the dominant realm. For instance, *The L Word* is set in West Hollywood, which already has the connotation of being a lesbian-driven community, and *Queer as Folk* represents a street community that predominantly exists out of gay bars, gay health clubs, an LGBT community center, and so on. Most of their characters assume an LGBT or queer identity, which makes queer desire the norm. Hence, by making queer desire hegemonic, heterosexual desire becomes exceptional and rare. The role reversal is found in the "queer point of view" that turns everything upside down and works in an anti-hegemonic fashion with regard to queer identities. "Agency" is clearly present, and resistance against the dominance of compulsory heterosexuality is articulated.

At another level, we distinguish the strategies of role reversal that are articulated by playing around with traditional gender roles and identities. These strategies are often encountered, and both female and male characters, queer and heterosexual, employ them. The text often supports role reversals under the guise of amplification, and the articulation is at the level of the mise-en-scène, a clear active "agency" conferring subjectivity to the performance that articulates a possible resistance. This strategy is clearly articulated in *Six Feet Under*, where the series' gay couple David and Keith

constantly renegotiate their roles toward each other in their relationship. They subvert the appropriation of fixed gender roles and parody them by mocking or exaggerating heteronormative domestic positions, for instance when David calls himself a “jealous housewife” on discovering that Keith is working late in a bar filled with gays (season 4, episode 7). They also renegotiate their sex roles through actively switching sexual positions (e.g., “bottom” and “top”). As such, they challenge the notion of a fixed sexual and relational position. Further, the series also deploys these role reversals in the dynamics of heterosexual relationships. For instance, Brenda’s boyfriend Joe actively desires to be sexually dominated, thus challenging the unquestioned dominant position of the male.

A final form of representing queer are the *strategies of rearticulation through discursive pleasure*. They articulate ambiguity in a more positive way, with the production of a discourse that very subtly resists patriarchal and heterosexual ideology. A theme often used in these strategies is female lesbian sexuality, which is represented as active and positive, without a radical reversal of the “gaze,” but certainly with a reversal of the object of the “gaze.” *The L Word* features several lesbian sex scenes that represent the characters as subjects with agency instead of objects of desire. In several sex scenes between Dana and Alice, for instance, the sex is not represented as picture-perfect and heavily eroticized but as messy and playful. In these strategies, the articulated resistance is much more subtle and incorporated, but the subjectivity that is created through the rearticulation of the discursive pleasure makes it possible to give it the meaning of resistance.

Conclusion

In this chapter we have argued that it is important for contemporary popular culture theory to include themes such as queer representation. This is the sphere of hegemonic and anti-hegemonic ideological production in which, according to Beverley Best (1998), social change and transformation are possible. Without pleading for a romantic turn to the radical politics of the voices at the margins, we emphasize the potential for a social transformation that allows the margins and the resistance to find places outside of and within the dominant order. This dialectic of the queer discourse either in the hegemonic sphere or at the margins can only be understood on the basis of a “snapshot” of the discursive repertoires. Queer articulations are dependent upon those that attribute meaning and have to be situated in time and space. The representational strategies are only one element in this complex realm of signifying practices. By conceptualizing resistance as fluid and situated, we are unable to differentiate “fixed” recurring patterns or to make general statements about the (in)existence of articulated queer resistance in the media sphere. But explorative studies such as this case study are important to embody queer theory into mainstream media studies and to point out in what way these queer representations are depicted without stating

that these representational strategies are interpreted in a specific way. The academic community should pay more attention to the theoretical richness and relevance of queer theory, and especially to the integration of these insights into film studies and media studies. Researching queer representation, queer theory, and the possibility of transgressing the boundaries by means of queer reading should be a part of this research in which identification is conceptualized as being detached from spectatorship. This case study in particular has argued that common representational strategies (parody, corporeality, matrix reversal, role reversal, and rearticulation through discursive pleasure) are used in contemporary queer television series. Beside the diversity of queer characters in these series, similar strategies of representation can be distinguished and can be seen as one of the main signifiers of queerness in the televisual machinery.

Mediated Portrayals of Masculinities

Heather L. Hundley

ABSTRACT

The focus of this chapter is specifically on how researchers have studied and written about the portrayal of masculinities in US media. The chapter opens by tracing the evolution of academic study of masculinities in US media beginning with stereotypical representations that led into identifying three key types: hegemonic masculinity, hypermasculinity, and metrosexual masculinity. The chapter then reviews how scholars have written about the portrayals of masculinities in specific US media such as film, television, and print. While this literature review is by no means exhaustive, it demonstrates the range of research in the past four decades, illustrating media's increased portrayals of masculinities over time, and offers suggestions for future directions.

Early feminist media studies research laid the foundation and sparked interest in the study of male characters. In fact, research on “masculinity studies in communication was scarce prior to the late 1980s” (Mazzarella, 2008, p. 69). To understand the development of examining masculinity in the media, one must understand the development of feminist media studies.

On the heels of second-wave feminism, many scholars in the late 1960s and early 1970s began examining the number of female characters in film and television.

Initially scholars typically used content analysis to count the number of female characters and compare it to the number of male characters. By the mid- to late 1970s, second-wave feminism was critiqued by scholars such as bell hooks (1981), who discussed racial differences among women. Thus, in the 1980s, media scholarship examining portrayals became even more complex, with many researchers claiming the importance of critically interrogating how characters' gender, race, and class were depicted as well. Today, scholars realize the myriad of traits, demographics, and other features of a person (regardless of being a real person in everyday life or a mediated character) in what is called identity studies.

With more women earning PhDs and becoming professors, many second-wave feminists began women's studies programs in universities. Noting that feminists do not just study women and women's issues, some feminists turned their interests to men and men's issues. Thus emerged gender studies programs, replacing preestablished women's studies programs.

Early gender research dichotomized males and females. Drawing from Derrida's notion of *différance*, male is what is *not* female. Hence, what is masculine is not feminine (Brown, 1999; Jeffords, 1994; Kirkham & Thumim, 1993; MacKinnon, 2003). Following this line of thought, masculinity was stereotypically associated with power, strength, hardness, action, and the public sphere, whereas femininity was linked to powerlessness, weakness, softness, passiveness, and the private sphere (Bean & Harper, 2007; Brown, 1999; Kirkham & Thumim, 1993).

It is important to note that these early conceptualizations of masculinity and femininity representing this simplistic dichotomy were established in most of the West. That is, biologically sexed bodies are referred to as boys/men or girls/women and culturally created genders are associated with these sexed bodies. Therefore, in the United States, men are masculine and women are feminine (D'Acci, 2004). Yet, while many cultures use the terms sex and gender interchangeably, others view them as separate traits (Jandt & Hundley, 2007). Thus, irrespective of different sex and gender concepts, a study of men or male characters is often a study of masculinity. Gendered portrayals in the media are salient to examine because they can be varied, which speaks volumes about the culture from which they evolve.

Often, the sex/gender differences are collapsed when critiquing mediated portrayals. For instance, drawing from Bordo's (1999) extensive research on the physical body, Worley (2000) aligned with Butler's (1990) work on the performance of genders and claimed that "although biology may constitute the male body, culture inscribes all bodies, including male bodies, with meaning" (Worley, 2000, p. 120).

The focus of this chapter is specifically on how researchers have studied and written about the portrayal of masculinities in US media. This chapter is written in two sections. The first traces the evolution of examining masculinities in US media beginning with stereotypical representations that led into identifying hegemonic masculinity, hypermasculinity, and metrosexual masculinity. The second discusses how scholars have written about the portrayals of masculinities in particular US

media such as film, television, and print. While this literature review is by no means exhaustive, it demonstrates the range of research in the past four decades and illustrates media's increased portrayals of masculinities over time.

From Masculinity to Masculinities: Evolving Portrayals in US Media

Initially the concept of masculinity was singular. The stereotypical, tough guy image in the media was a "known and stable concept" (MacKinnon, 2003, p. 33). "Fundamentally, Hollywood movies show the process by which gender is represented – and masculinism maintained and threatened – in our culture" (Bingham, 1994, p. 19; also see Horrocks, 1995). Craig (1992) wrote that "masculinity is what a culture expects of its men" (p. 3). While the standards were difficult to define, Kirkham and Thumim (1993) noted that while masculinity was not definitive, men must live up to it in our culture. Despite these vague concepts of masculinity, as with portrayals of femininity, several scholars expressed the inherent power media maintain in perpetuating unrealistic portrayals (Bingham, 1994; Kirkham & Thumim, 1993; Mason, 1992; Morrison & Halton, 2009; Vavrus, 2007). In fact, the "media have perpetuated the perspective that individuals who do not conform to their assigned gender are abnormal and unnatural" (Cooper, 2002, p. 53).

By the late 1980s, gender research was "increasingly interdisciplinary, drawing on research from social and behavioral sciences as well as the humanities and even the natural and biological sciences" (Kimmel, 1987, p. 11). By the early 1990s media scholars followed suit, drawing from numerous disciplines, including gender studies, anthropology, and sociology, and came to realize that masculinity varies in culture and history (see, e.g., Connell, 1987; Jandt & Hundley, 2007; Messner, 1996). All bodies, including men's, were considered sites "where differing and evolving versions of masculinity [or femininity] are envisioned and performed" (Worle, 2000, p. 120; also see Bordo, 1999). This was evident in the media as well; "Over the years tough guys [in the movies] changed" (Neibaur, 1989, p. 1).

Based on Connell's (2002) research, Kivel and Johnson (2009) maintained that "while masculinity is grounded in difference, it is not a static characteristic or personal identity trait. Instead, masculinity is a fluid construct that is organized within social relations and ultimately changes those social relations" (p. 110). Furthermore, the concept of masculinity is "fraught, divided, and therefore changeable" (Penley & Willis, 1993, p. xviii). Thus, because of its malleability and as "an ongoing discursive and cultural practice" (Vavrus, 2007, p. 247), the term "masculinities" became widely used and accepted (also see Beynon, 2002; Connell, 1987; Hearn & Morgan, 1990; MacKinnon, 2003; Mazzarella, 2008; Messner, 1996; Woodward, 2004) "to more adequately describe the complexities of male social position, identity, and experience" (Katz, 1995, p. 134).

Differing Masculinities in the Media

In the past four decades, with the increased scholarly attention on mediated portrayals of gender, several types of masculinities emerged. For instance, in the 1980s, initially scholars examined masculinity in the media as if it were one unified concept and argued that masculine stereotypes were confining (Farrell, 1986). A decade later there was an attempt to categorize the roles that men play in the media. Scholars at the Sixth Annual Children and the Media Conference, for example, summarized five classic media icons of masculinity: “The Joker,” “The Jock,” “The Strong Silent Type,” “The Big Shot,” and “The Action Hero” (Children Now, 1999a).

Simultaneously, rather than categorizing men’s roles in the media, several scholars described masculine characteristics displayed in the media. The characteristics were generally based on stereotypes. For example, in a focus on portrayals of males in mediated sport, a study reported that masculine images traditionally included speed, danger, and aggression and showed that a “real man is strong, tough, aggressive, and above all, a winner” (Children Now, 1999b, p. 11).

Jeffords (1994) noted seven masculine qualities, namely, being competitive, athletic, decisive, unemotional, strong/aggressive, powerful, and never feminine. Other masculine traits included comradeship, loyalty, bravery, endurance of pain and suffering (Newsinger, 1993), the ability to inflict and endure violence, survival skills, adventure, exploration, courage, and ingenuity (Ryall, 1993). Some scholars found that alcohol consumption was also identified with masculinity (see, e.g., Hundley, 1995; Lyons, Dalton, & Hoy, 2006; Strate, 1992; Wedding, 2000; for more masculine characteristics see Beggan & Allison, 2001; Jhally, 2002; Messner, Dunbar, & Hunt, 2000; Williams, 1994).

As an extension of listing stereotypical masculine characteristics, scholars began theorizing and developing terms related to masculinity in the media. These terms were used to describe particular types of men/masculinities. For instance, in his analysis of movies from the 1950s, Cohan (1997) discussed two types of masculinity, “hard” and “soft.” “Hard masculinity,” he claimed, was “the standard when defending the nation’s boundaries” (p. xii), whereas “soft masculinity” was the standard “of an orderly, responsible home life” (p. xii). Hard masculinity, then, aligned with John Wayne Westerns and war films, while soft masculinity paralleled Jimmy Stewart movies about domestic life.

Connell (1985) initially coined the term “hegemonic masculinity,” explaining it as a culturally naturalized form of masculinity. This form consisted of stereotyped traits and characteristics of being a “real man” that focused on power. It served to privilege and legitimate patriarchy (also see Fahey, 2007; Hanke, 1998; Mazzarella, 2008; Trujillo, 1991). Furthermore, hegemonic masculinity naturalized the roles men and women play in our culture, but more importantly, the media portrayed it in terms of “how particular groups of men inhabit positions of power and wealth and how they legitimate and reproduce the social relationships that generate their dominance” (Carrigan, Connell, & Lee, 1987, p. 179).

Hegemonic masculinity incorporated aspects of feminism (MacKinnon, 2003), thus, in addition to displaying manly stereotypes, mediated hegemonic masculine characters were also seen contributing with household responsibilities, sharing in child raising, and supporting their wives' ambitions. Hanke (1992) referred to these characters as feminized men. This type of masculinity was particularly apparent in 1980s television that featured "softer" men in touch with their feelings (McEachern, 1999).

Hegemonic masculinity was accounted for in both US culture and US media. Sociologists referred to this feminization of men as a "crisis in masculinity." Cohan (1997) concurred that "a culture's representation of masculinity in crisis thus often reflects a perceived 'feminization of men'" (p. xi). Creeber (2002) explained that this "crisis" was partially a result of the post-Fordist era, which is also recognized as the deindustrialization of US culture. Hence, a "new breed of man" was born, a "sensitive man" (Creeber, 2002, p. 170). Once hegemonic masculinity was identified and denaturalized, the "natural" characteristics of masculinity, including heterosexuality and Whiteness, were exposed.

In reaction to feminized men portrayed in the media, extreme versions of masculinity were identified in the media as well. Scholars theorized hypermasculinity as a form of extreme masculinity void of any feminization. It was defined as characterizing men who were "tough, aggressive, ultra-competitive, strong and dominating" (Iwamoto, 2003, p. 45). Furthermore, hypermasculine men were powerful, hypersexual, and feared. This type of man was "incompetent in personal relationships" (Prusank, 2007, p. 169) and ultimately provided excuses for "bad boy" behavior (Prusank, 2007).

As a defense against feminization of men in the United States (Joyrich, 2000) and as a reaction to this "problem," Hollywood began producing hypermasculine characters such as "Dirty" Harry Callahan (*Dirty Harry*, *Magnum Force*), John Rambo (*Rambo*), and John McClane (*Die Hard* series) to combat soft male characters such as television's Frank Furillo (*Hill Street Blues*), Michael Steadman (*thirtysomething*), and John Cage (*Ally McBeal*). More recent examples of hypermasculine men are evidenced with Black men, particularly sports stars, gangsta rappers, and thugs (see Iwamoto, 2003; Means Coleman, 2002; Pompper, 2010; Saddik, 2003; Wolfe, 2003).

Whereas several scholars believed hypermasculinity was a reaction to hegemonic masculinity, Palmer-Mehta (2009) argued the theoretical construct of mediocre masculinity as a morphing form of hegemonic masculinity "to fit the contemporary social situation" (p. 1070). This is a type of masculinity in which men are far from ideal. *The Man Show* and its first hosts, Jimmy Kimmel and Adam Carolla, served as examples of mediocre masculinity. Despite being mediocre, they still maintain their power as White males.

In the past decade, yet another type of masculinity emerged – metrosexual masculinity. Initially used in 1994 by cultural critic Mark Simpson, media scholars began examining this type of masculinity in the media about a decade later. What MacKinnon (2003) termed the "new man," Tragos (2009) deemed the "metrosexual" (p. 545). Described as "a gift to advertisers, the metrosexual image-conscious man

spends considerable resources on appearance and lifestyle” (Pompper, 2010, p. 684; also see Shuggart, 2008; Simpson, 2002). This included men who were “unashamed about beauty care, shopping, and spa treatments” (Bing, 2003, p. 68). While hegemonic masculinity embodied a feminized version of masculinity, metrosexuals embody a feminine version of masculinity. The metrosexual is a heterosexual, “in touch with his feminine side” (Aldrich, 2004, p. 1733), yet some people may consider him gay or bisexual (Coad, 2008).

Opinions differ on the reasons for the emergence of hegemonic, hyper-, and metrosexual masculinities. The deindustrialization of the United States combined with second-wave feminism certainly provide rationales for masculinity to possess feminist ideals. Whether that occurs hegemonically or not is a matter of perspective. For some, this softer form of masculinity may have been a “crisis in the feminization of men.” Hence, hypermasculinity could be argued as a reactionary device. As an extreme version of masculinity, “hypermasculinity exposes anxiety about masculinity” (MacKinnon, 2003, p. 5). Yet, as an extension of that argument, some scholars may claim that hypermasculinity presented a crisis in the overmasculinization of men. As a reaction, metrosexuals emerged in media and culture. Despite the explanations of why these masculinities emerged, it is evident that the US media depict several types of masculinities.

In reviewing literature regarding the portrayals of masculinities in US media, it is apparent that a hierarchy of masculinities exists. Scholars agree that hegemonic masculinity is the most preferred or encouraged in the media, whereas other forms of masculinities are subordinated. Moreover, homosexual masculinities are “at the bottom of the gender hierarchy among men” (Connell, 1995, p. 78). In fact, hypermasculinity and metrosexual masculinity are said to reify hegemonic masculinity, as the next section of this chapter reveals. In so doing, US media validate White, male, heterosexual privilege in the culture.

Hegemonic Masculinity in the Media

Whether explicitly stated or not, hegemonic masculinity is quite prevalent in the literature describing portrayals of mediated masculinities (see, e.g., Gardiner, 2005; Hanke, 1998; Jansen, 1994; Jeffords, 1994; Katz, 1995; Kirkham & Thumim, 1993; Mason, 1992; Mazzarella, 2008; McEachern, 1999; Messner, 1996; Prusank, 2007; Walsh, 2009). Trujillo (1991), for instance, capitalized on the theory of hegemonic masculinity. In his analysis of baseball pitcher Nolan Ryan, he argued five key characteristics Ryan possessed that expressed hegemonic masculinity. They were physical force, occupational achievement, familial patriarchy, frontiersmanship, and heterosexuality. The literature pertaining to mediated portrayals of hegemonic masculinity contains some commonalities with several stereotyped characteristics of masculinity, such as being strong, heterosexual, powerful, and White.

In reviewing the literature, it is evident that researchers concur that this form of masculinity remains at the top of the masculine hierarchy whereas all other forms are subordinated masculinities and exist to reaffirm hegemonic masculinity. For instance, Mazzarella (2008) examined the three main male characters in the cable television reality program *American Chopper*. In her analysis, she claimed that the father, Paul, represented hegemonic masculinity whereas his sons, Paulie and Mikey, portrayed subordinated and complicit masculinities respectively. This, she argued, legitimated patriarchy and granted credibility to the traditional male role.

In Gardiner's (2005) examination of the *South Park* film *Bigger, Longer, and Uncut*, he found that the male portrayals reaffirmed hegemonic masculinity as "the world is a playground of powerful, male-bonded, American white boys" (p. 61). Thus, for male characters that do not fit these descriptors, they existed to substantiate the preferred version of masculinity.

Similarly, in an analysis of the television situation comedy *Home Improvement*, McEachern (1999) illustrated how the show juxtaposed two versions of masculinity. The supporting character, Al Borland, portrayed "soft masculinity" whereas the main character, Tim Taylor, represented the "wild man" who generally displayed hegemonic masculinity but occasionally depicted examples of hypermasculinity. Interestingly, rather than giving complete preference to the hegemonic form, McEachern (1999) noted that these two versions "enable the comic mode of the sitcom to constantly interrogate these masculinities and their relationship" (p. 11) to each other. In fact, the "gags question the authenticity of his [Tim's] masculinity" (p. 14). As evidenced in this review of mediated hegemonic masculinity, scholars have critically engaged in examining how media support this form of masculinity and juxtapose it against other forms of masculinities. Ultimately, such analyses allow scholars to question hegemonic social constructions of gender and expose their racist ideology and preferred sexual orientation supporting White heteronormativity.

Hypermasculinity in the Media

One way of questioning masculinity, including hegemonic masculinity, is through portrayals of ubermasculinity or hypermasculinity. This extreme form of masculinity includes "a cool pose ritualizing masculinities of toughness, pride, control" (Pompper, 2010, p. 684; also see Iwamoto, 2003; Majors & Billson, 1992). While hypermasculinity is not necessarily race specific, more often it is connected with Black masculinity. For instance, in a study of Tupac Shakur, Iwamoto (2003) argued that "the gangster or mob image was one of the main cultural-media influences on the formation of Tupac's identity" (p. 46). Moreover, "the gangsta culture or 'thug' lifestyle reinforced Tupac's hyper-masculine values" (p. 46). While identifying Tupac's hypermasculine image projected in the media, Iwamoto (2003) claimed that Tupac was well aware of media's racist bias but nevertheless capitalized on it to his own demise.

In an ethnographic account of convicted felon Caryon Johnson, Means Coleman (2002) connected the “thug life” to Black male characters in films like *Boyz n the Hood*, *Friday*, and *Menace II Society*. Such characters displayed excessive power, control, and strength over women, in the streets, and in their neighborhoods. Furthermore, they defied traditional enforcement by engaging in unlawful behaviors.

Earlier research did not necessarily use the term hypermasculinity, but in their descriptions and arguments, the term was implied. For instance, Brod (1987), Jhally (1990, 1992), Katz (1995), and Katz and Jhally (1999) expressed concerns about the pervasive reification of violence and masculinity (a construct of hypermasculinity) as a cultural norm. With examples such as Arnold Schwarzenegger, Sylvester Stallone, and Bruce Willis, predominantly young, male audiences “latch onto big, muscular, violent men as cinematic heroes” (Katz, 1995, p. 135). Parallel to this description, Mosher and Sirkin (1984) explained that a “macho man” possessed callous sexual attitudes and displayed violent tendencies. Furthermore, danger was exciting to macho men (also see Mosher & Tomkins, 1988; Tomkins, 1979).

McEachern (1999) and Prusank (2007) described hypermasculine characteristics and claimed them as “natural” traits in all men. For instance, Prusank (2007) studied teen magazines and compared two forms of masculinity – the “good/new” man (e.g., hegemonic masculinity) and the “natural” man (hypermasculinity). In examining these distinctions, Prusank (2007) stated that “inherent within all males is the potential for the ‘new man’” (p. 170); however, the “natural man” also exists, perhaps just below the surface.

McEachern’s (1999) examination of *Home Improvement* found that despite Tim Taylor’s desire to understand women (a characteristic of hegemonic masculinity), as he often discussed interpersonal issues with his neighbor, Tim’s base need for “more power,” as he supercharged up anything with a motor, was difficult to escape. According to McEachern, this quest for power (a component of hypermasculinity) was Tim’s “natural” trait. Nevertheless, McEachern suggested that hypermasculinity was less desirable than hegemonic masculinity because, more often than not, it resulted in embarrassment and degradation for Tim.

Another study that compared “traditional masculinity” (i.e., hegemonic masculinity) with “uber-hegemonic masculinity” (i.e., hypermasculinity) was Woodward’s (2004) study on boxing. Without using the term hypermasculinity, she described its characteristics. Specifically, Woodward wrote that boxing is “a spectacle beset with contradictions and ambiguities enjoyed and reviled in equal proportions” (p. 15) in that it depicts a “display of the perfect body and the grotesque [excessive] body” (p. 15) simultaneously. Hence, the excessive bodies in boxing are spectacles that, in essence, parody the male body. Therefore, Woodward claimed that ultimately boxing’s display of excess served as a “mock masculinity,” reaffirming traditional masculinity.

While the aforementioned scholars suggested that hypermasculinity was less encouraged or reviled in US media than hegemonic masculinity, others argued whether hypermasculinity was a result of hegemonic masculinity. For instance, in

analyses of men's magazines published in 2001, Gauntlett (2002) took direct issue with Jackson, Stevenson, and Brooks (2001) in terms of their position on the "crisis on masculinity" and how it was played out in the media. Specifically, Jackson and colleagues (2001) found that men's magazines in the 1990s reasserted old-fashioned masculinity and served as a backlash against the feminization of men. Gauntlett (2002) readdressed the "crisis" by stating that "contemporary masculinity is 'in crisis' since women are more successful" (p. 250) and that "men's problem is not their new role, it's clinging on to the old one" (p. 251). Hence, he found that men's magazines presented "insecure men finding their place in the world" (p. 180).

Metrosexuals in the Media

As a relatively new construct, metrosexual masculinity in the media has been examined by a handful of scholars (Clarkson, 2005; Draper, 2010; Gamson, 2005; Lewis, 2007; Ramsey & Santiago, 2004; Sender, 2006; Shuggart, 2008; Westerfelhaus & Lacroix, 2006). Interestingly, the majority of literature about mediated metrosexuals examined the popular cable television program *Queer Eye for the Straight Guy*. Shuggart (2008), for instance, studied 35 episodes of *Queer Eye for the Straight Guy*, a book by the same name, and *The Metrosexual Guide to Style: A Handbook for the Modern Man*. As a result, she claimed that metrosexuality was used to "rationalize commercial masculinity" (p. 280). In fact, most of the literature concluded the same thing. That is, that gay men were used to "solve the 'problem' of the male consumer" (Sender, 2006, p. 133), particularly White male heterosexuals.

Diverging from *Queer Eye*, Draper (2010) examined three editorial transformations of *Details* magazine. Initially, the magazine was gay-inclusive, depicting hegemonic masculinity. The second incarnation of the magazine was exclusively straight and what Draper called *Maxim-ized* (after *Maxim* magazine). This suggested the magazine contained illustrations of hypermasculinity. The third editor decided to recreate *Details* magazine and present metrosexual masculinity. By doing so, Draper (2010) claimed the magazine "utilized gayness to construct difference between 'straight' masculinities" (p. 357). Further, he contended the magazine "constructed new male audiences" and "legitimized them [i.e., metrosexuals] as 'authentic' straight identities" (p. 357).

Clearly the research on masculinities in US media has identified various types of masculinities. Generally speaking, they can be categorized as hegemonic masculinity, hypermasculinity, or, more recently, metrosexual masculinity. In addition to acknowledging these types of masculinities, scholars concur that the media present a hierarchical preference. Furthermore, while some scholars provide explanations for the emergence of multiple masculinities, they do not all agree.

Masculinity and Race

Research exists examining mediated portrayals of the intersection of masculinities and race.¹ That is, scholars are asking how masculinities are depicted by characters from a variety of racial backgrounds. Analyses of Whiteness and masculinity are generally synonymous with analyses of hegemonic masculinity. However, other than studies of hegemonic masculinity, most of the research involving masculinity and race examines Black characters (see, e.g., Brown, 1999; Cornwell & Orbe, 2002; Dunbar, 1999; Elise & Umoja, 2009; Gabbard, 2004; Orbe & Lyons, 2009; Persson & Newman, 2008). Nevertheless, there is also research examining masculinity and other ethnicities including Chicanos (Fregoso, 1993), Asians (Parrenas & Siu, 2007), and Native Americans (Parker, 2003) in the US media.

Other than work on hegemonic masculinity, which incorporates Whiteness, other studies explicitly examined the portrayal of White masculinity (see, e.g., Bannister, 2006; Butterworth, 2007; Consalvo, 2003; Oates, 2009; Walsh, 2009). Consalvo (2003), for instance, critically examined news coverage of Dylan Harris and Eric Klebold, the two boys responsible for the Columbine High School shooting spree. She found that the media portrayed them primarily as monsters, having no gender. Secondly, the media subordinated their masculinity, portraying them as “geeks.” In terms of race, ultimately, Consalvo (2003) claimed that the media portrayed them as “deviant by choice” since these “middle class white boys were denied a privileged position promised to them” (p. 40) by society.

In another article that juxtaposed masculinity and race, Walsh (2009) examined the *New York Times*, CNN, and MSNBC coverage of the Democratic primary from January 2008 to June 2009. She argued that Hillary Clinton portrayed hegemonic masculinity by making race invisible whereas Barack Obama was depicted as an alternative form of masculinity since he was effeminate, not White, not Black, and not manly. The fact that Clinton is a woman highlights the social construction of gender and is further discussed in the next section of this chapter.

While comparing mediated portrayals of White and Black masculinities, Jeffords (1994) stated that it was the White man’s burden of masculinity to save countries (*Rambo* series), artifacts (*Indiana Jones* series), or corporations (*Die Hard* series). Discussing *Lethal Weapon* and *Die Hard* as examples, she continued that Black men did not have that burden. Rather, Black men enforce the system whereas White men challenge the system. Thus, mediated masculinities by race do vary.

Traditionally, portrayals of Black masculinities have been limited and stereotyped. Orbe and Hopson (2002) confirmed this in their examination of seven African American male cast members from nine seasons of MTV’s *The Real World*. In their semiotic analysis, the Black characters were portrayed as “angry, emotionally unstable or unpredictable or both, a violent threat, and sexually aggressive” (p. 220). As a result, the authors argued that these portrayals “legitimized a general fear of Black men” (p. 220).

In Brown's (1999) study of Black superheroes in comic books, he posited that masculinity in Western culture is equivalent to White masculinity. However, he maintained that Milestone Comics targeted to Black consumers "offers an alternative to hypermasculinity" (p. 26), which all too often prevails in portraying Black masculinity. Pointedly, he argued that typical Black superheroes are "too hard, too physical, too bodily" (p. 27), whereas their White counterparts represent a wimp/warrior duality (e.g., Clark Kent as Superman). Yet, according to Brown (1999), the Black superheroes in Milestone Comics emphasize brains over brawn, which depicts a welcome new type of Black masculinity.

Similar to Brown's (1999) claim that Black men are oftentimes portrayed as hyper-masculine, Persson and Newman (2008) contend that Black characters in the media are shown as overtly sexual and produce a "monstrous masculinity" (p. 632) that contributes to racial tensions. Despite these mediated portrayals, Dunbar (1999) viewed the "marginalized status of black masculinity" as a capitalizing opportunity for NBA player Dennis Rodman. Moreover, she argued that Rodman's diversion of hegemonic masculinity distinguished his eccentricities and visual style, which was packaged and sold to consumers.

Whereas the media portray Spike Lee "in unidimensional and stereotypical ways" (Orbe & Lyons, 2009, p. 371) "as confrontational, controversial, and as audacious" (p. 371), Orbe and Lyons assert that he is also a "family man," "an indispensable activist," and "changing and evolving" (pp. 376–377). In his films, "Lee's depictions of black men differ sharply from the images cast by Hollywood" (Elise & Umoja, 2009, p. 298). In an examination of Spike Lee's movies, Elise and Umoja (2009) contend that "he abandons the one-dimensional presentation of the black man as a macho hero, eunuch, sidekick, amoral pimp/hustler/thug, and the buffoon" (p. 299). Instead, Lee reveals Black men as "sexual beings, not brutes: vulnerable to their passions, not victims of them" (p. 297). Furthermore, the Black men in Lee's films are "virile, intelligent, and essential" (p. 299).

Garnered by Brown's (1999) study of Milestone Comics, Elise and Umoja's (2009) analysis of Spike Lee films, and Orbe and Lyons's (2009) examination of Spike Lee, it may be easy to suggest that nonracist, realistic portrayals of a racial masculinity must be created by someone from that race. However, Cornwell and Orbe (2002) revealed that it is not that simple in their study of *The Boondocks* comic strip. Specifically, Cornwell and Orbe found that readers expected *The Boondocks* creator, Aaron McGruder, to represent the African American community – a task impossible to achieve. Not only are members from any community broadly diverse, but audiences maintain the power to interpret mediated portrayals in a variety of ways.

In an analysis of the film *Zoot Suit*, Fregoso (1993) argued that typically a range of masculinities is possible for the dominant culture. Nevertheless, for non-White males, masculinity is depicted as narrow and negative. Chicanos, she claimed, were generally portrayed in the media as violent, unruly conquistadors, blood-thirsty Aztecs, greasers, Latin lovers (e.g., sexually promiscuous), and gang members. However, the film she examined depicted a transformation of the

Chicano from being a violent gang member to revealing a positive version of masculine brotherhood.

Just as initial studies on masculinity focused on stereotypes, early research on masculinity and race has done the same. hooks (2004) contended that racist, capitalist patriarchy continually produces limited constructions of Black masculinity. Yet, irrespective of mediated racial stereotypes, “analyses of masculinity and race are striving to avoid any easy reductionism” (Nakayama, 2000, p. 113). Researchers continually interrogate the ways media represent racial masculinities.

Masculinity and Class

Very few studies have examined the intersection of the portrayal of masculinity and class in the media (Consalvo, 2003; Crawley, 1998; Mazzarella, 2008; Reser, 2005). While Consalvo’s (2003) article about Harris and Klebold touched upon the boys being from middle-class families, the thrust of her argument was not about the boys’ economic status. Reser (2005), however, focused on class as a major factor in how masculinity is portrayed in the film *The Full Monty*. Reser argued that women in this film maintained the economic power, whereas the out-of-work male protagonists engaged in stripping to earn money and, therefore, reclaimed their masculinity.

Similarly, Mazzarella (2008) examined working-class masculinity in the cable television docusoap *American Chopper*. She claimed that the program was a celebration of respectable working-class men’s work in that every episode highlighted skilled vendors contributing to the custom craftsmanship of motorcycles.

In another article, Crawley (1998) examined coverage of the America’s Cup race and maintained that “sailing has been used as a site for demonstrating masculinity among sailing’s upper- and middle-class, male participants” (p. 33). Hence, clearly, economic status has implications for how masculinity is portrayed, yet relatively few scholars have engaged in such analyses.

Masculinity and Sexual Orientation

As mentioned, hegemonic masculinity was solely about heterosexual males, among other characteristics. However, in the early twenty-first century, researchers have focused on gay masculinities (see, e.g., Avila-Saavedra, 2009; Fejes, 2000; Goltz, 2007; Linneman, 2008; Morrish & O’Mara, 2004). In his review of research on gay masculinities, Fejes (2000) noted that “in the past, a gay male acted [stereotypically] masculine as a way of hiding the fact that he was gay. Today, a gay male can be both masculine and openly gay” (p. 116).

Linneman (2008) examined the sitcom *Will & Grace* and found that the show included multiple representations of gay masculinities. These ranged from an effeminate gay man to a “very straight gay” (p. 583). What some scholars call gay masculinity Morrish and O’Mara (2004) deem “alternative” masculinity in their analysis of cable television’s *Queer Eye for the Straight Guy*. In their research, the authors conclude that the show confirms gay stereotypes and depicts patriarchal supremacy, but illustrates five versions of gay masculinity with the show’s five recurring characters. Avila-Saavedra (2009) conducted a discourse analysis of television shows with leading gay male characters (e.g., *Will & Grace*, *It’s All Relative*, *Queer Eye for the Straight Guy*) and determined that while increased numbers of gay characters are evident on television, they do not challenge heteronormativity.

Extending research on gay masculinities, Goltz (2007) examined the magazine *Instinct* and argued that it depicts hypermasculine queerness, which was defined as oversexed gay men taking pride in having multiple partners. The magazine’s portrayal of hypermasculine queerness was “performed through dismissive sarcasm, irony and ‘harmless fun’” (p. 99). While the magazine “delights in offending readers and mocking them” (p. 99), Goltz dismissed the parody since *Instinct* “does not claim social responsibility” (p. 107).

Similar to early research on portrayals of women in the media, and then later on men in the media, stereotypical representations were highlighted. The discussion of hegemonic masculinity began and, shortly after, analyses of hypermasculinity started appearing in scholarship. This aligns with research on gay masculinities in that early research argued that the media stereotypically portrayed gay men. As with research on hypermasculinity, and as a reaction to feminized hegemonic masculinity, Goltz (2007) found extreme versions of gay masculinities perhaps to combat effeminate gay portrayals.

Masculinity and Gender

The introduction of this chapter noted that sex and gender are distinguished in many cultures. However, many cultures naturalize a connection between a person’s biological sex and socially constructed gender. While masculinity is a performed gender associated with men in Western culture, research has just begun to untangle this connection by exploring instances in which women demonstrate versions of masculinity. For instance, Walsh (2009) claimed that Hillary Clinton was portrayed as an example of hegemonic masculinity during the Democratic primary in an analysis of the *New York Times*, CNN, and MSNBC. Mandziuk (2000) characterized masculinity as a “transgressive masquerade” (p. 105) in her discussion of “crossing borders beyond gender difference” (p. 105). Finally, drawing from Halberstam (1998), Cooper (2002) analyzed the film *Boys Don’t Cry* and argued that it destabilizes masculinity and heterosexuality by normalizing female masculinity.

As evident in this review, the study and portrayals of masculinities in the media have evolved. Initially, scholars exposed various masculine stereotypes in the media. Then research on hegemonic masculinity, hypermasculinity, and metrosexual masculinity began appearing in academic journals and books. By denaturalizing hegemonic masculinity, scholars then began questioning how race, class, sexual orientation, and gender influenced the depiction of masculinities in the media. Clearly, “masculinity is constantly being constructed and reconstructed in culture, within and across boundaries of race, class, ethnicity, and age, often in contradictory ways” (Gabbard, 2004, p. 58). This trajectory illustrates the evolution of the portrayal and research on mediated masculinities. It is clear that masculinities are not static and diversity is seemingly considered.

By understanding the myriad versions of masculinities and the diverse characteristics that shape masculinities, the next section of this chapter reviews how scholars have examined masculinities in specific media, namely television, film, and print.

Masculinities “Appropriate” for Specific Media

In reviewing the literature regarding portrayals of masculinities in the media, it was obvious that some scholars focus on specific media. For instance, some scholars examined masculinities in film (see, e.g., Bingham, 1994; Fregoso, 1993; Gabbard, 2004; Jeffords, 1994), while other scholars studied masculinities in television (see, e.g., Feuer, 1986; Fiske, 1987; Joyrich, 2000). Cohan’s (1997) research alluded to genre-specific masculinities. Moreover, research suggested that a specific portrayal of masculinity was more acceptable in a particular medium, therefore viewers should expect a certain type of masculinity when consuming certain media. The next section reviews the literature in this area and discusses some implications.

Masculinities across Media

Masculinities in Film

Investigations of masculinities in film are primarily published in books about stereotypical, hegemonic, or hypermasculinities (see, e.g., Bingham, 1994; Jeffords, 1994; Kirkham & Thumin, 1993). Some books focus on specific racial masculinities in film (see, e.g., Fregoso, 1993; Gabbard, 2004; Parrenas & Siu, 2007). Despite recognizing a film genre-specific masculinity, MacKinnon (2003) claimed that masculinity was jeopardized and questioned in 1970s films. As a result, hypermasculinity was predominant in 1980s films (also see Bingham, 1994). She found that, in films in the

1990s, a tension was created between individual heroic versus social and family responsibilities. She posited that films today possess an increasing focus on masculinity as a troubled and unsure construct.

Other scholars examined specific film genres. Krutnik (1991), for instance, studied masculinity in film noir and thrillers. Akin to this research, Jeffords (1994) focused on hypermasculine images in action/adventure films. Grevin (2009) coined a new film genre, the double protagonist film, and claimed that such films are “represented by two diverging styles of masculinity, the narcissistic and anachronistic social outsider” (p. 27), also referred to as the masochist. In this genre, Grevin claimed, the masochist was preferred whereas the narcissist was portrayed negatively. These scant examples evince an oversight of research of masculinities in particular film genres. That is, one might assume that the portrayal of masculinity in a “chick flick” is far more divergent than the portrayal of masculinity in a war movie. More research is needed to assess the range of masculinities within various film genres.

Masculinities in Television

Just as film has gendered genres, so does television. As such, some television critics (Feuer, 1986; Fiske, 1987) argued that particular programming is directed to specific gendered audiences. For instance, feminine television contains continuing and multiple storylines, numerous characters, emphasis on dialogue, sensitive male protagonists, stereotypically macho male villains, disruption, and polysemy (Fiske, 1987). Feuer (1986) explained that a feminine narrative was akin to (daytime and night-time) soap operas such as *General Hospital* and, more recently, *Desperate Housewives*.

Masculine television, on the other hand, is goal centered and consists of one storyline, an emphasis on action, competition, male bonding, and an absence of both women and traditional obligations (family and work). Feuer (1986) deemed masculine narratives as cop/adventure shows. In the 1980s such programs included *Magnum P.I.*, *Miami Vice*, and the *A-Team*. Today, masculine television is evident in sports programming such as that presented by the NFL, NBA, and other professional associations.

Mazzarella (2008) argued that the cable program *American Chopper* presents a docusoap genre for men. That is, the series is a blend of traditionally feminine programming such as soap operas; however, it simultaneously maintains characteristics of masculine genres such as an absence of women and the presence of competition and male bonding. Similar programs on cable television fit this description, such as *Pawn Stars*, *Deadliest Catch*, and *Ax Men*.

With the increased technology of cable, satellite, and fiber-optic delivery allowing for more narrowcasting and niche programming, the representations of gender on television have changed dramatically since the 1980s (D’Acci, 2004). In fact, since the 1970s and early 1980s, D’Acci claimed that gender binaries have been broken. Gauntlett (2002), however, recognized the differences in genres. For instance, from

the 1950s through 1970s, 65 to 80% of characters on television were men (Elasmar, Hasegawa, & Brain, 1999; Gunter, 1995). During the 1995–1996 television season, 65% of characters were men. Nevertheless, in 1970s sitcoms, the male to female ratio was nearly 50:50 (Miles, 1975).

Indeed, televised “representations of gender today are more complex, and less stereotyped, than in the past” (Gauntlett, 2002, p. 90). While television broadcasts “the man channel” and “movies for guys who like movies about guys,” networks like Lifetime, Oxygen, and WE present stereotypical “women’s” programming and broadcast networks air content for mix gendered audiences. Since television is an easily accessible mass medium, it makes sense to present a variety of masculinities to appeal to the broadest audience possible. In the sitcom *Two and a Half Men*, for instance, Alan, one of the two male protagonists, is more nurturing and feminine whereas Charlie, the other male protagonist, is oppositionally chauvinistic and demonstrates hypermasculine tendencies most of the time. Both characters are juxtaposed against each other, both are laughed at, and both have redeeming qualities. This allows audience members to connect with or select the portrayal of masculinity that suits them best. It also suggests that men should not be too feminine or too masculine.

Masculinities in Print

Fewer scholars have published research examining the portrayal of masculinity in print compared to masculinity in film and television. The research on print media includes books (Bean & Harper, 2007; Beynon, 2002; Mandziuk, 2000), comics (Brown, 1999), newspapers (Beynon, 2002), magazines (Gauntlett, 2002; Goltz, 2007; Mooney, 2008; Prusank, 2007), and advertising (Jhally, 2002; Messner & Montez de Oca, 2005; Wenner, 2009).

In terms of books and literature, Bean and Harper (2007) examined three books targeted to young adults. They found that the books presented gendered performance with socially scripted characters, but that they were open to change. In essence, the books they studied presented wider visions of how boys can be masculine. Mandziuk (2000) argued that literature can present masculinity in very transgressive forms. Yet Beynon (2002) examined newspapers and popular books and discovered negative portrayals of fathers, who were depicted as physically or emotionally absent. From this brief review, it appears that portrayals of masculinities in literature can be far more diverse than on television and in film.

In analyses of masculinities in magazines, scholarship is incongruent. Specifically, Jackson, Stevenson, and Brooks (2001) claimed that men’s magazines present hegemonic and hypermasculine portrayals of masculinity. Gauntlett (2002), however, argued that men’s magazines depict men as complex and contradictory, focusing on

stereotypically repressed aspects of masculinity such as health, fashion, and relationships. More akin to Jackson and colleagues (2001), Mooney (2008) found that men's magazines highlight sexuality and naturalize pornography. Like film and television, it appears that the genre has great control over the versions of masculinities portrayed. Hence, *Maxim*, *Playboy*, and *Penthouse* may draw on stereotypical, hegemonic, and hypermasculine depictions of masculinities, whereas magazines such as *Men's Health*, *Men's Journal*, and *GQ* may present alternative versions of masculinities such as metrosexual masculinity. Similar to books, the narrowcast nature and prevalent individual consumption enable a broad variety of masculinities to be portrayed in magazines.

Finally, while advertising is not a medium *per se*, it does rely on media to promote goods. Hence, studies on masculinities in advertising typically involve print media, yet some also include television. The most consistency was found here in terms of scholarly conclusions about masculinities in advertising. Just as ads with women predominantly feature sexualized femininity, D'Acci (2004) pointed out that masculinities have "long been used by commercial culture to associate heterosexual desirability with consumer products and consumerism" (p. 376) as well. Further, regardless of whether masculinity or femininity is presented in advertisements, "everyone is under pressure to look good" (Gauntlett, 2002, p. 90) and "consumer capitalism makes objects of us all" (MacKinnon, 2003, p. 100).

Future Research

This review was designed to give readers an overview of the development of research on portrayals of masculinities in the US media. It remains clear that as media representations evolved, so did the scholarship. As society changed with World War II, the civil rights movement, second- and third-wave feminism, the end of the Cold War, deindustrialization, and other recognizable events, so too did portrayals of gender in the media.

It should be evident that research in this area is not complete. While it remains important to continually examine hegemonic functions of masculinity, hypermasculinity, and metrosexual masculinity, there are large gaps in research exploring race, class, sexual orientation, and gender. In fact, identity studies should continue to examine how masculine identities are portrayed, reified, resisted, or altered.

Further, genre studies can investigate what types of masculinities are acceptable, unacceptable, prevalent, or absent in particular media or within specific genres in various media. That is, the vast majority of male characters in sitcoms are feminized and far from hypermasculine. Hence, should scholars choose to examine the types of identities (e.g., masculinities, including raced, classed, gendered, skilled, sexually aligned) that are successful in various media or within specific genres, this will tell us more about the culture in which we live.

NOTE

- 1 The term “race” is used here since that is the term used in the literature. However, Orbe and Drummond (2009) posited that, given the opportunity, people of color were more likely to “question US categories for race and ethnicity” (p. 437). While the terms White, Black, Asian, Hispanic, and others are limited and “rigid conceptualizations” (p. 437), they are the terms used in the literature. Analyzing these terms is beyond the scope of this chapter.

Shifting Contours of Indian Womanhood in Popular Hindi Cinema

Sujata Moorti

ABSTRACT

This essay offers an overview of the shifts in representations of woman and femininity in popular Hindi cinema. Through a historical overview the essay underscores the relationship between the cinematic figure of the woman and the nation-state. During the colonial era, the category Indian woman was a capacious one, including men who cross-dressed and foreigners as well as Indian women. Ironically, these images were allegories for the anticolonial nation-in-formation. In the postcolonial era (1950s–1980s), the figure of the woman symbolized the many facets of India's struggle for self-reliance. Since the 1990s, images of Indian women have become one of the primary sites where the anxieties of globalization are worked through. The essay argues that contemporary Bollywood films offer a very limited repertoire of images of the ideal Indian woman. However, Hindi films from an earlier era offered more tantalizing possibilities for the articulation of a female subjectivity.

A tall, masked, pistol-wielding woman wards off a bunch of villains from atop a moving train. This blonde, blue-eyed, strapping female equivalent of Robin Hood is not a Hollywood persona but, rather, a very popular star from early Hindi cinema, Nadia. Known by her fans as *Hunterwali* (the huntress), Nadia is the antithesis of the stereotypical coy, all-singing, all-dancing Hindi film star associated with today's Bollywood. How

did an Australian come to be one of the most popular female stars of Hindi cinema in the 1930s, during the height of the anticolonial nationalist movement? This is one of the paradoxes this chapter explores as it offers an overview of the representations of women in popular Hindi film. The iconic figure of Nadia serves as a touchstone for us to understand the complex narrative positions accorded to woman and the feminine in Hindi film. In the analysis that follows, I contend that early Hindi cinema offered a great variety of roles for women, roles that permitted women to assert their autonomy and authority even as they were tethered by social gender roles. In addition, as I illustrate, the concept of the Indian woman on screen was a capacious term not bounded by geography or narrow understandings of gender. Notwithstanding the few compelling films of the late twentieth and early twenty-first centuries, this essay argues that the era of globalization has been marked by an attenuation in the roles assigned to the female and the feminine. This nonlinear historical trajectory offers some insights into the manner in which concerns about the nation are mapped onto the figure of the female. This chapter does not offer a facile equivalence between representations of women and discourses of the nation. Rather, it uses cinematic images as a way to think through the shifting ideas ascribed to gender at any given moment. It also does not offer a nostalgic idealization of the past; instead my arguments about the historical differences in gender roles seek to underscore how changes in the cinema industry, its formalization and incorporation into a global marketplace, are inscribed in narrative structures. This exegesis on the representations of women is also instructive in thinking through the relationship between technology and modernity. If cinema is the exemplary technology of modernism and melodrama the central genre for articulating its accompanying structures of feeling, then how can we understand the relationship between cinema and society in an era of global capitalism?

Much as in Europe, the technology of cinema was introduced in colonial India in 1896. In the 100 years that have followed, the Indian cinema industry has numerically surpassed its Western counterparts in terms of production, circulation, and reception. As I and other scholars have argued, Hindi cinema – one of several regional language cinemas – has largely been considered India's popular culture. The industry rivals Hollywood in terms of production; daily audiences number in the millions; and its reach expands beyond the boundaries of the nation-state, not just to the diaspora but to many parts of the global South (Larkin, 1997; Rajagopalan, 2009; Sen, 2008). Through an examination of the central role the female figure has come to occupy in this arena of popular culture, I will outline what is at stake in these images and why we must heed them to understand not just Indian media culture, but also that society at large.

For audiences unfamiliar with the conventions of Indian cinema, watching a film could be a befuddling experience. The movies tend to be long – they are now a little over two hours but in the past ran well over three hours. They are often characterized as melodramas and contain multiple storylines. Scholars describe Indian cinema narrative structure as marked by “endless digressions, circularities, and plots within plots” (Dissanayake & Sahai, 1992, pp. 10–11). Above all they are structured by the

two epics, *Mahabharata* and *Ramayana*. Indian films often refer overtly and covertly to themes addressed in these ancient Sanskrit epics. The *Ramayana* charts the narrative of the righteous King Rama who is exiled and returns after vanquishing King Ravana. A key narrative here is Ravana's abduction of Sita, Rama's wife, and her successful rescue. The oral narrative offers prototypes of the ideal brother, ideal wife, and ideal husband. The *Mahabharata* is a longer epic, and documents the story of two warring sections of a dynastic family. The narrative includes the *Bhagvad Gita*, often identified as laying out the precepts of Hindu philosophy. These epic stories could be understood reductively as melodramas with multiple subplots and as staging the triumph of good over evil.

Most Indian films have between six and seven songs, but these movies are technically not musicals, or at least not as the concept is understood in the West. These films defy understandings of genre, and instead contain elements of romance, tragedy, action-adventure, and comedy all in one narrative. Starting in the 1970s, this multi-genre cinema was called the *masala* film (the Hindi word *masala* refers to the spices used in Indian cuisines), and this aspect is identified as a key defining feature of Indian cinema (Lutgendorf, 2006).

It is important to note that the label Indian cinema is a catch-all phrase encompassing a number of regional cinemas, with their own modes of production and distribution, most notably Tamil, Malayalam, and Bengali cinemas. The Bombay-based¹ Hindi cinema industry that I examine in this essay has come to occupy the status of the national cinema, and it is this cinema most people refer to when they speak of Indian films.

Soon after the first screening of the Lumière Brothers' film in Bombay in 1896, Indians started to experiment with this technology. In the era of the silent film, one could argue that Indian cinema could be understood in the singular. The emergence of sound technology marked the proliferation of linguistic and regional variabilities, fracturing any idea of a homogeneous Indian film industry (Ganti, 2004; Kabir, 2001). On an international level, what transpires often as Bollywood refers specifically to Hindi cinema.

The arguments in this essay are confined to mainstream Hindi cinema. I would make very different arguments about gender if I were to examine any of the other regional cinemas. For instance, it could be argued that Malayalam and Bengali films offer some transgressive paths whereas Tamil films are emblematic of the seductions of patriarchy. Any of these regional cinemas could help us understand why some ideas about femininity, femaleness, and heteronormativity continue to resonate with audiences. In the essay that follows, my focus is exclusively on popular Hindi cinema, although I make some references to art cinema. As I explain later in the essay, beginning in the 1960s, the Indian government started to sponsor alternative cinema through the Film and Television Institute of India (FTII) and later the National Film Development Corporation (NFDC). The FTII offered formal training in all aspects of the film industry while the NFDC provided funding for films that eschewed the popular Hindi cinema grammar. Directors such as Shyam Benegal, Adoor

Gopalakrishnan, and Santosh Sivan are associated with this alternative cinema, which is often referred to as art cinema.

Considering the wide swathe of materials I wish to examine, any approach adopted will necessarily be partial and schematic. I have opted to track the historical variations in the representation of women. Following existing conventions in Hindi cinema scholarship, I work with a periodization practice that is simultaneously attentive to changes in the film industry and key moments in national history. Thus, I examine first the colonial era (1900–late 1940s); second, the 1950s–1980s, encompassing the “golden era” of Hindi cinema and its decline; and third, the 1990s–present, which mark the emergence of a global Hindi cinema or Bollywood. Rather than map the shifts in representations in a nationally determinist fashion, this periodization is intended to be suggestive of possible vectors of confluence. This technique is likely to raise more questions than answers, but this is also part of the essay’s charge to lay out possible areas of future scholarship.

This chapter is situated within and emerges from a feminist film perspective; I consider the categories woman and femininity not as biologically fixed but as unstable and constantly evolving. Thus, even though the essay is designed to illustrate the shifting roles assigned to the figure of woman at various points in popular Hindi cinema, I will illustrate that the Indian woman depicted is an ideological construct growing out of and as a response to the newly emerging idea of the nation and a concept of modernity that is radically vernacularized (Hansen, 1999).

A few more caveats are necessary. Cinema watching in India has always been a noisy, communal, and rule-defying experience. For instance, the silent film era was silent only nominally. Apart from the live musical accompaniments, the film-viewing experience was a highly participatory one including live performances by dancing girls, jugglers, and musclemen (Burra, 1981). Even today, in an era of multiplex theaters, audiences sing along to the songs on screen, recite the hero’s lines, and maintain extended conversations with the on-screen actors. Feminist film theories premised on the cinematic experience as a highly individual one do not translate well under these conditions (Doane, 1987; Mulvey, 1975). Similarly, although the majority of the audience in theaters tend to be male, Mulvian theories about the male gaze or the Oedipal structuring of gender lose some of their explanatory power in the Indian context, especially since the modes of production, circulation, and representation in Hindi cinema are at odds with the Hollywood model (Majumdar, 2009). Veena Naregal (2004) points out that mainstream Indian cinema’s mode of address “makes little attempt to subordinate spectacle and visceral effect to reinforce the realist illusion” (p. 521).

Consequently, this essay is informed by insights from Anglo-American feminist film theories but is not structured by them. In this historical overview of popular Hindi film’s representation of woman and femininity, I illustrate how gender as an ideology is mobilized in Hindi cinema; I signal the particular ways in which femininity, sexual difference, and heteronormativity help propel narrative movement, and I outline the ways in which Hindi cinema has worked through the conundrum of

female pleasure and sexual desire. I draw as well on postcolonial feminist theory to situate the representations of women within pervasive colonial and patriarchal structures. As this essay reveals, the landscape of gender in Hindi cinema is quite complicated and does not adhere to a formulaic binarized understanding.

Reel Women?

Colonial-era films (1896–1947) are marked by great variability in representations of gender. During the silent cinema era, when the technology was still a novelty, Indian filmmakers relied largely on retelling already familiar stories. Thus the colonial era witnessed the proliferation of movies that were derived from the aforementioned epics, *Ramayana* or *Mahabharata*. The first full-length Indian feature film was about Raja Harishchandra (Phalke, 1913), a tale embedded in the *Ramayana*. Early Indian films also centered on biopics of iconic figures such as *Kalidas* (Reddy, 1931), a renowned Sanskrit poet, or *Sant Tukaram* (Damle, 1936), a seventeenth-century poet. These familiar stories often served as an alibi to underscore nationalist, anticolonial sentiments. Although the British had strict censorship laws in place, Indian filmmakers used a number of symbols, such as the spinning wheel, to signal their empathies for the nationalist movement. Since none of these films exists in their entirety, one must rely on extra-cinematic materials such as publicity posters or newspaper accounts to chart this period in film history.

In narratives derived from the epics, women figured only marginally, and even these figures were played by men. As Neepta Majumdar (2009) has noted, one of the primary reasons for the cross-dressing practice was the stigma associated with the cinema industry. In a tenor akin to that of Frankfurt School theorists such as Theodor Adorno and Max Horkheimer, the intelligentsia in India disdained cinema as epitomizing the low taste of mass culture (and as the antithesis of high culture). Adorno and Horkheimer (1972) believed mass culture served the interests of capitalism, thereby cultivating false needs. They coined the term “culture industry” to set up a contrast with the high arts, such as painting and classical music. Indian intelligentsia, including government officials, held views that were analogous, and branded cinema as vulgar entertainment with no redeeming features. In light of this condemnation, the upper classes, particularly women, did not want to be associated with cinema. There is a double process at work here. At the turn of the century, under colonial codes of gender, “respectable” women were not associated with the public sphere. Any woman who appeared in the public arena was immediately associated with being a prostitute or at the very least as not respectable. This division of public and private realms seems identical to Victorian gender relations in the West, but as Partha Chatterjee (1993) has noted, in colonial India the public–private split took on a different salience. During the colonial era, Indian men conceded the public arena as associated with the West and modernity. The private arena was then recast as the

repository of Indian tradition. In particular, the private arena was designated as the female realm and conceptualized as the domain of Indian culture and values. Consequently, women's exclusion from early Indian cinema was ideologically driven under the signs of patriarchy, colonial ideology, and class privilege. Nevertheless, because early cinema relied on the epics, women could not be thoroughly expunged; they appear in the silent era as a spectral presence with cross-dressing men hinting at the possibilities but never fully occupying the status of women. Scholars have noted that several reviews of the early cinema pointed out the delicacy of features and femininity of the cross-dressing men, but these actors' authentic femininity was also disavowed by the reminder that these *reel* women were *real* men (Majumdar, 2009). As I point out later, in this era gender was framed as performance and not as biology.

As Indian films started to move out of the familiar narratives of the epics, they became an important staging ground for the rehearsal of a nationalist gender ideology. In contrast to British understandings of India as a society and culture oppressive to women, the anticolonial nationalist movement exculpated religion and Indian tradition. Nationalist leaders were apt to turn to a (mythologized) distant past of gender equality in India. They argued against the civilizing mission of colonialism, claiming that a return to India's true past and not a turn to the West would restore women's rights. Within such a discourse women had to simultaneously ascribe to age-old traditions and be modern subjects.

In her sweeping overview of the representations of women in Indian cinema, Urvashi Butalia (1984) identifies *Gunsundari* (*Why Husbands Go Astray*, Chandulal Shah, 1927) as the first film to address the "woman question." Unlike in the earlier movies where men performed female roles, in this instance the female protagonist was played by Dorothy Kingdom, a foreigner. The narrative centers on a philandering husband who turns to a dancing girl because his spouse does not perform her wifely duties to his satisfaction. In an attempt to secure her marriage and draw her husband away from his paramour, the woman becomes more modern. Butalia (1984) argues that the movie instructs women to be dutiful wives and companions to secure happiness. Even while acknowledging the focus on wifely devotion, other scholars have singled out the film as characteristic of the manner in which colonial Indian cinema tried to recast conjugality in a modern mold, as a companionate relationship (Barnouw & Krishnaswamy, 1980).

During the silent era, the individual roles offered women were quite limiting, reiterating a restrictive gender ideology. Nevertheless, what made this era interesting is the range of women who were given these roles. Most "respectable" women did not enter films; nationalist ideology had secured the private sphere as that of women and of tradition. This ideological practice was compounded by Hindu and Muslim codes of conduct, which enjoined women not to display their bodies to the public. However, those who were not structured by such authoritarian patriarchal codes of docility, chastity, and purity found the Indian film industry to be a receptive work arena. Thus there was Patience Cooper, the aforementioned Dorothy Kingdom,

Ruby Myers, who took on the stage name Sulochana, Renee Smith, who was cast as Sita Devi – these women were Anglo-Indians and Eurasians, or people who could be theorized as subaltern in this context. In film after film these actors were assigned roles from epic tales that extolled the virtues of docile, obedient, and self-sacrificing women. These actors adopted familiar “Hindu” names (except for Patience Cooper), but their embodied presence also opened up the space assigned to the category Indian woman. In this instance, Indianness was not about biology but about how one performed femininity. Such an expansive definition suggests that Indianness was about how one behaves, the values one espouses, and was not determined by consanguinities. Sangeeta Datta (2000) characterizes the presence of these foreign women as an early moment of global forces operating in Indian cinema. In subsequent years, many of these women could speak enough Hindi to carve successful careers after the advent of sound technology. As mentioned previously, the talkies resulted in the fragmentation of Indian cinema into a variety of linguistic and regional cinemas.

During the colonial era, Hindi films often gave voice to ideas that were central to the nationalist movement. British censorship laws, however, required that these messages were coded. Ideas pertaining to social reform, such as securing women’s education and widow remarriage, could be articulated unambiguously as they were not seen as anticolonial. In this milieu of redefining the modern Indian woman, Devika Rani emerged as the “first lady of the Indian screen.” One of the first “respectable women” to enter the film industry, Devika Rani worked initially as a set designer before she was cast as a princess in *Karma* (Frantz Osten, 1933), a bilingual, Indo-German production. She also starred in *Achut Kanya* (*Untouchable Girl*, Frantz Osten, 1936) a film that adopted a key topic of social reform within the anticolonial nationalist movement: the dismantling of the caste system. The film narrates a doomed love story between an upper-caste Brahmin boy and an untouchable teenager. While the fathers of the two protagonists approve of this transgressive romance, others in society frown upon them. By narrative’s end the romance is thwarted as the two marry within their caste. If Devika Rani’s character was revolutionary because she crossed caste lines, she is also domesticated by narrative’s end when she becomes the self-sacrificing wife who dies to protect her husband. Scholars have singled out this role as creating the archetype of the village belle in Hindi cinema (Datta, 2000). *Achut Kanya* is emblematic of the limited perch provided women in the colonial-era cinema. While the narrative gestures toward (radical) social change, the figure of the modern Indian woman serves to recuperate the existing order where the wife remains bound by conventions and devoted to her husband. While on screen Devika Rani’s character ends up fitting the narrow confines of the modern traditional woman, offscreen she challenged the social order. She was a co-founder of Bombay Talkies, a major Hindi film studio, and a collaborator in Indo-German productions. The choices Rani made in her private life shaped her star persona and illustrated how the Indian female star has been fraught with contradictions (Chakravarty, 1993; Majumdar, 2009).

Devika Rani’s reign as a star occurred at the same time as the popularity of Nadia – the swashbuckling hero who figures in the opening paragraph of this essay – soared.

Cinematic depictions of Indian women tap into two contradictory representational archives. The most prevalent one is that of the docile, chaste, and submissive woman, as I have already outlined. By tapping into images of fierce warrior goddesses, Indian women could also be represented as aggressive and independent. Nadia fits into this second model of an authoritative and strong femininity (Gandhy & Thomas, 1991). Born in Australia, Mary Evans adopted the name Nadia. Working with the studio Wadia Movietone, she was predominantly known for her roles in stunt films, riding atop a speeding train, chasing villains on a charging horse, or physically outmaneuvering villains. Her iconic role in *Hunterwali* (*The Lady Hunter*, Homi Wadia, 1935) captures some of the anomalies of the positions assigned to women of this era: even as Devika Rani had to resort to being a subservient, tradition-bound wife, Nadia could wield a whip, clad in a tight sheath and tall boots. The blonde star's sexuality was carefully elaborated, but her films rarely concluded with a traditional romantic ending for her character.

Most critics compared her unfavorably against “respectable” stars, but her fans acclaimed her as Fearless Nadia. She made her career in stunt films such as *Miss Frontier Mail* (Homi Wadia, 1936), *Hurricane Hansa* (Homi Wadia, 1937), *Punjab Mail* (Homi Wadia, 1939), *Diamond Queen* (Homi Wadia, 1940), and so on. Actor and filmmaker Girish Karnad recalls Nadia as his first memory of cinema. With her swashbuckling heroics she symbolized for him courage, strength, and idealism (quoted in Thorner & Krishnaraj, 2000). Nadia transformed the already-popular stunt genre by fearlessly challenging oppressive social forces and protecting the poor in film after film. Stills from her movies and publicity posters show her with every kind of weapon – bows and arrows, swords, whips, pistols – lifting men over her head, and playing with lions. Nadia was frequently shown working out in the gym, which promoted a “keep-fit” craze at that time (Gandhy & Thomas, 1991).

Nadia as a tough, capable, omnipotent image served as an alternative role model for women in the colonial era. In addition, her films frequently exhorted women to fight for themselves. Nadia subverted the dominant stereotype of Indian woman as a docile suffering victim. Instead, she was represented as a woman possessed of exceptional physical strength and prowess, which is recapitulated in the image of Radha in *Mother India* (Mehboob Khan, 1957), as I explain below.

The daughter of a British soldier, Nadia served as an unlikely allegorical figure for the nationalist struggle. In more recent years, following the release of a 1993 documentary *Fearless Nadia: The Hunterwali Story* (Riyad Wadia, 1993), she is now being recast as the first feminist of Indian cinema while others have found her a useful entry point to offer queer readings of early Hindi cinema (Wenner, 2005).

Recent scholarship has excavated more about female stars from the colonial era such as Durga Khote and Sitara Devi. These writings offer an important palliative to the hagiographic accounts of early Indian cinema, which have been peopled almost entirely by males. Rather than rehash these narratives, I have offered above a brief account of two leading female actors and the kinds of roles offered them. While not representative, this account is suggestive of the possibilities available for women in

the early years of cinema. A recurrent concern in colonial cinema is the interplay between tradition and modernity in a variety of fields, and woman becomes the central node for this discussion.

A New Nation's Cinema: From Strong Mothers to Docile Wives

The cinema of the post-independence era (1947 onward) was marked by dramatic shifts in the industry following the collapse of the studio system. Family-based banners, such as R. K. Films headed by Raj Kapoor, took the place of the studios. In addition, the partition of the nation resulted in several stars and industry figures moving to and from Pakistan. Concerns and symbols from the colonial era continued to crop up in movies from the 1950s, but the tone of Hindi films shifted. A new cadre of directors, such as Mehboob Khan, Guru Dutt, and Bimal Roy, influenced by Nehru's secular ideals and the principles of the Progressive Writers' Movement, produced a series of films that are the core of what is considered to be the golden era. Hindi films from the 1950s offered a sharp social critique with a balance of song and dance sequences; these films were deemed a new genre called the "social." Ravi Vasudevan (2000) has identified the social film as one that addresses issues of social justice through a focus on the family. These films continued to tease out the relationship between modernity and tradition, often through the figure of the woman, but this dialectic was parsed as one central to the survival of the nation. Guru Dutt's films, such as *Pyaasa* (*Thirst*, 1957), offered a scathing critique of existing attitudes toward prostitutes and the commodification of art. Similarly, Raj Kapoor's films, such as *Awaara* (*Vagabond*, 1951) and *Shree 420* (*Mr. 420*, 1955), emphasized the conflicts between urban and rural India, modernity and tradition, and offered a more humane vision for the new nation. The new India these films envisaged would be rid of all vestiges of the corrupt past, but only after a sustained struggle. Hindi films from the 1950s were not only popular in the subcontinent but had a huge following in the Soviet Union, Greece, Egypt, Nigeria, and other countries.

In the social film, female roles were predominantly limited to that of the lover of the male protagonist. In movies such as *Barsaat* (*Rain*, Raj Kapoor, 1949), the female stars of Nargis and Nimmi are celebrated for their constancy, loyalty, and willingness to sacrifice their happiness for their families. In the "social" film, women were presented as central to the project of nation-building, but their autonomy was not of paramount importance. Rather, the narratives helped to shore up a limited definition of the traditional Indian woman.

The rising star of the 1950s films was undoubtedly Nargis, who was paired repeatedly with Raj Kapoor. Her character in *Mother India* is often singled out as exemplifying the new roles assigned to women in the social film: wife, mother, and beloved. Mehboob's film drew upon the conventions of the social but also offered significant

variations from that genre. In a gesture reminiscent of colonial-era rhetoric, the film validates the maternal and imagines the Indian nation as female.

The nationalist movement used the evocative slogan of Mother India (*Bharat Mata*) as a rallying cry and to engender a specific structure of feeling in this emergent culture. The future-nation-to-be was personified as a mother goddess and a whole range of popular culture products promoted this vision. In this rhetoric the nation was represented as a female figure, a composite of the Hindu goddesses Lakshmi (wealth), Saraswati (knowledge), and earth. The future nation was visualized as a woman in a sari, often a saffron one. The image was crafted carefully so that her bodily contours were mapped onto the geographic space of the nation. By tapping into the Hindu pantheon of goddess figures, this slogan simultaneously represented the maternal woman as caring and nurturing as well as fierce and aggressive in protecting her children. The Mother India slogan permitted nationalist leaders to conceptualize the independence movement as akin to religion (Ramaswamy, 2010). In addition to this nationalist valorization of the maternal figure, a US writer, Katherine Mayo, published a book entitled *Mother India* in 1927 that offered a scathing critique of Hindu society, culture, and religion. The book effectively validated the “civilizing mission” of British colonialism. During the independence movement, nationalist leaders devoted a lot of energy contesting Mayo’s book. In the post-independence era too, leaders were preoccupied with invalidating Mayo’s claims and offering a different vision of Mother India. The iconization of the nation as female has continued, but with different valences (Chakravarty, 1993; Datta, 2000). Mehboob’s film and the figuration of Nargis as Radha must be understood within these multiple discursive strands that feminize the nation and valorize the maternal.

The melding of the material, romantic lover and modern female subject come together in an evocative fashion in *Mother India*. Scholars have offered very nuanced accounts of Mehboob’s vision, his depiction of the female protagonist, and the effects of the film in contemporary Hindi cinema (Bagchi, 1996; Chatterjee, 2008; Thomas, 1989). Mehboob’s film was made ten years after India secured its independence and has been characterized as a paean to the new nation. In a film noted for its production values, its musical score, and its script, the narrative centers on Radha, played by Nargis, who we first encounter as an old woman, revered by her community. Through a story narrated entirely in flashback, we come to understand how Radha comes to occupy such a central location in the village. We witness her transformation from a young submissive wife to the village’s grande dame. Through a lifetime the film documents her persevering against a corrupt moneylender, natural disasters, her husband’s disappearance, and the death of her children. In this melodrama, Radha is clearly the focus; the film extols her strength and power, which are seen as integrally bound with her respect for traditional values (Thomas, 1989). Through all her travails she remains a paragon of wifely devotion and chastity. She is also depicted as honorable; when her adored younger son abducts a young woman, Radha kills him, asserting that she may be a mother but she is also a woman.

In her in-depth and provocative analysis of the film, Gayatri Chatterjee (2008) points out the different ways in which Mehboob mobilizes Hindu mythology to layer and thicken the narrative. Radha comes to stand not only for the ideal mother but also for the future of the nation; through her tenacity she propels her community from destitution to industrial modernity, a site of dams and cranes. Mehboob offers a melodramatic account of womanhood but his film also acknowledges the conditions of the peasant class. Radha is depicted working the fields, a perfect comrade to her husband; once he disappears she tends the fields alone. She is simultaneously in charge of the home and the domestic sphere. Mehboob's *Mother India* blends socialist ideals with traditional values. Radha is shown consistently as a worker and a mother, linking repeatedly work and sexuality. The film depicts motherhood as an affective condition and also as labor. Through this juxtaposition the movie offers a celebration of femininity that goes beyond a sentimental evocation of the mother. In an unusual move, the film begins with a third-person documentary-like account, but then the narrative is taken over by Radha and it is her point of view that predominates. She appears as the iconic wife, an active narrative agent, and a symbol. In most of the social films from the 1950s, the female characters are presented as strong and their power resides in their adherence to traditional values. *Mother India* is unique in that it does not present a male protagonist as securing Radha's rights. Rather, it is she who fights for her rights and those of other dispossessed people in her community. It is also narrated from her point of view.

Binarized Femininity

The 1960s marks the decline of the golden era and the rise of romances and action-adventures. In terms of gender, what is most significant is the emergence of a binarized femininity: the good woman/bad woman. In film after film, the good woman is depicted as a self-sacrificing mother, a dutiful daughter, or a respectful wife. She does not question the men in her life and reveres social traditions. The good woman is always pitted against the bad woman for the hero's affections. In a resuscitation of anticolonial rhetoric, the bad woman is conjured as someone "Western," independent, and presented as antithetical to middle-class values (Butalia, 1984, p. 109). In effect, the other "side of the coin of modernity" is equated with being bad. The figure of the bad woman became so formulaic that a small group of actors was associated with it and stars like Helen gained a following for her performance as the vamp.

I have argued elsewhere that Helen acquired cult status, playing the figure of the femme fatale in over 700 films (Moorti, 2003). Her character offered the counterpoint and the foil against which idealized Indian femininity could be reiterated; she is the negative print of the ideal Indian woman and a condensation symbol of Western degeneracy (Mazumdar, 2007). Helen Richardson, the actress whose screen name is Helen, is of Spanish and Burmese origin. She is reminiscent of Nadia because her

racial otherness was signified similarly through overt markers of alterity: hair, dress, name, and behavior. Like all the bad women or vamps, Helen was typecast in a narrow mold: licentious, Westernized, overtly sexual, given to drinking alcohol and smoking cigarettes, and, above all, putting on lewd staged performances dubbed as cabaret. Given names like Rosie or Mary, “she was parodied as either an Anglo-Indian (a racial outcaste) or a member of India’s Christian minority. A demi-mondaine, she was often a cabaret dancer operating in smoke-filled bars, nightclubs, or similar ‘foreign’ dens of vice [...] where clad in a tight-fitting western gown she performed audacious dances” and tried to lure the hero (Kasbekar, 2003, p. 299). Above all her deviance from the good woman model is marked by her demonstrations of uncontrolled female lust and wantonness.

Although she is the antithesis of Indian femininity, the vamp’s role is often more of an equal to the hero than the heroine. The vamp’s role is also feminine in that she is present on screen to evoke desire and be the sex object. Dressed in campy feather boas, elbow-length gloves, and fishnet stockings, the vamp represents the rebel who does not seek social acceptance. Anecdotal evidence suggests that the figure of the vamp, specifically that of Helen, has been incorporated in Indian gay subculture. In effect, some scholars have argued that in the good woman/bad woman model of Indian femininity, the vamp becomes the site of all sexuality and the good woman is leached of any affect or desire, except that of compliance and subservience. In Hindi cinema from the 1960s and 1970s, the vamp is the only female character depicted as having agency and as a subject who acts on her own behalf. She never wins the hero’s affections but she has an autonomy and subjectivity that are denied the good woman.

The one other instance in which female sexuality is foregrounded is in the courtesan film. The *tawaif* or courtesan film was a subgenre centered on the figure of the female public performer. Unlike the caricatured figure of the vamp, the courtesan is a site from which Hindi cinema reflects upon the historical transformations unleashed by modernity (Chakravarty, 1993). The courtesan films are tragic melodramas where the gendered contradictions of the modern Indian nation are laid bare. Significantly, the courtesan is a public performer, literate, and well versed in high culture.

Courtesan films, with their focus on a lost Mughal culture, could be interpreted as representing a nostalgia for a pre-British India. Scholars have also identified these films as representing a limited form of resistance to conventional gender roles (Virdi, 2003). The *tawaif* encapsulates key masculine and feminine characteristics and challenges gender binaries. As a financially autonomous, public woman, the courtesan occupies a masculine cinematic space; her ability to control her sexuality allows her to reconfigure the mantle of respectability. For instance, the courtesan may reject a suitor and proclaim her respectability by refusing the highest bidder, if necessary. However, her cinematic presence as a seductress reiterates her femininity. She is repeatedly presented as a sexual subject, and an object of male desire. Greg Booth (2007) contends that the *tawaif* constitutes a third gender while Oldenburg’s (1991) ethnographic account fleshes out how this resistant, female-centered community survives in patriarchal society. However, the filmic version of the courtesan

narrative domesticates this transgressive figure by positioning her as someone who seeks the respectability offered through marriage and domesticity. Once she falls in love, she willingly gives up her independence (and her public performances) to become an abject figure longing for conjugal bliss; she willingly submits herself to a singular male figure. While the domestication of woman was a common theme of the “socials,” the courtesan genre hinges on how this domestication is accomplished.

The *tawaifs* are more heroic than their respectable counterparts, and they are often more heroic than their lovers as well. The courtesan is a more active agent of narrative resolution than other Hindi female film figures. Her desire to be desired is, however, repeatedly relocated within the confines of domesticity and conjugality. The courtesan's ability to queer gender scripts is thus very limited. In Hindi cinema grammar the *tawaif*, who was once an active participant in courtly Mughal culture as a singer, is reduced to a prostitute (Arora, 1995). The courtesan film is exemplified by *Pakeezah* (*Pure Heart*, Kamal Amrohi, 1971) with Meena Kumari as the protagonist, who falls in love with an aristocrat. It is also one of the rare films where a courtesan successfully transitions from a public performer to a respectable woman. This sub-genre is emblematic of the modes through which Hindi cinema inched its way through the ideological contradictions laid bare in the narrative transition from feudal romances to modern romances.

Urvashi Butalia (1984) contends that in the 1980s, Hindi cinema starts to respond to some issues raised by the women's movement such as rape, dowry, and widowhood, if only in a superficial manner. *Insaaf ka Tarazu* (*Scales of Justice*, B. R. Chopra, 1980) is emblematic of a film that seemingly responds to feminist concerns about rape, but the manner in which the topic is narrated and depicted does little to dismantle dominant (mis)understandings of the crime. The film's heroine Bharati (Zeenat Aman) is an independent career woman working as a model; she is financially independent and is able to support her schoolgirl sister, Nita. Bharati is raped by a rich industrialist, Ramesh, and presses charges against him. She loses the court case, and subsequently her job, and is forced to relocate to a new town with her sister. When Nita comes of age and seeks a job, she is raped by the same industrialist during her interview. Bharati responds by taking a gun and killing the rapist at his office. In the criminal trial that ensues, Bharati gives voice to familiar feminist claims about the trivialization of female complaints and the law's inability to attend to rape claims. Comprehending the misogyny of the legal system, the judge frees Bharati. On one level the film is attentive to issues raised by the women's movement; however, the camerawork serves to reposition women as sexual objects of the male gaze and not as sexual subjects. The rape scenes are enacted at great length; the framing and editing of these sequences are more akin to seduction than violence. This and other rape-revenge films offer the possibility of an “angry woman” genre with women positioned as vigilantes. Apart from the visual grammar, the film's narrative too undermines its feminist claims (Virdi, 2003). In her impassioned address to the court, Bharati reiterates a conventional good woman/bad woman dichotomy and

positions Indian women as “temples of worship.” Such rhetoric erases the violence of rape as an assertion of male power and instead redefines it as a religious desecration. *Insaaf* moves the female protagonist beyond the status of a self-sacrificing victim and into a vigilante. However, through Bharati’s assertion of a virgin/whore dichotomy as a counterpoint to rape, it becomes clear that the film’s engagement with feminism is only skin deep. *Insaaf* was representative of a range of rape-revenge narratives that emerged in the 1980s, replete with possibilities but disappointing in the final analysis.

However, there was at least one thin slice of Hindi cinema that offered some more affirming possibilities. The decline of the golden era was accompanied by the rise of an alternative cinema, which was often characterized as art cinema in direct opposition to the popular aspects of Hindi cinema. As I have mentioned previously, the training and funding sources for this genre of Indian cinema are the most significant markers of difference between this and mainstream popular cinema. Alternative cinema narratives offered a wider range of possibilities for female protagonists. In these movies, women occupy locations of the socially disenfranchised such as in *Manthan* (*The Churning*, Shyam Benegal, 1971) or *Nishant* (*Night’s End*, Shyam Benegal, 1975), but they also possessed an agency that is refreshing. *Mirch Masala* (*Spices*, Ketan Mehta, 1985) is emblematic of this genre foregrounding the manner in which women are sexually objectified in rural India, where feudal practices predominate. However, the female protagonist does not submit to the local patriarch and instead mobilizes other women to collectively fight the oppressive system. Unlike popular Hindi films that reiterated women’s cinematic status as objects of the male gaze, Mehta’s film refuses the Mulvian gaze (Bagchi, 1996). For instance, the film shows the male landlord gaze lasciviously at women, but the audience never sees the women through his gaze. Mehta’s film does not position the audience as voyeurs; rather, he subverts our expectations to see women through the male gaze. The historical setting of the narrative draws attention to the continuities between historical formations and contemporary settings in how gender roles are materialized.

In the 1980s apart from “feminist” directors in the alternative cinema circuit, actors start to cross over between art and popular cinemas. Consequently, a stable of actors – such as Shabana Azmi, Smita Patil, Deepti Naval – start to be associated with roles which, if not feminist, at least broaden the possibilities for women. This was also accompanied by the entrance of more women directors in mainstream Hindi cinema such as Sai Paranjpe, who provided women-centered films that moved beyond the existing repertoire even while working within existing Hindi cinema grammar. Radha Subramanyam (1996) singles out *Rudaali* (*The Crier*, Kalpana Lajmi, 1992) as exemplifying this cross-over practice, wherein a subaltern subject internalizes, resists, and subverts the dominant ideology. The movie is based on a short story written by Mahasweta Devi and is overtly feminist in its form and content. Examining the movie, Sumita Chakravarty (1999) highlights the aspects that are lost in translation from literary text to filmic narrative. She argues

that while the movie foregrounds an agentic female subjectivity, in an effort to appeal to a popular audience the representation of the protagonist nevertheless hews to mainstream cinematic grammar. The film foregrounds female friendships and mother–daughter bonds, but it does not offer possibilities for agency outside the stereotypical positions patriarchal culture offers women. Movies outside of the mainstream offer tantalizing possibilities for reconfiguring Indian femininities but often fall short of their radical aims.

The Global Romance

In the 1970s and 1980s increasingly Hindi cinema became more about men and masculinity as the “angry young man” genre emerged. This subgenre reflected the growing disenchantment with the Nehruvian secular project and the oppositional position popular culture adopted with respect to the government. Superstar Amitabh Bachchan is most commonly associated with this role, where he ventriloquized the common person’s anger toward an unequal and exploitative social order (Deshpande, 2005; Kazmi, 1998). Like rape-revenge narratives, the vigilante justice promoted by these movies offered individual solutions to structural problems. While these movies seemed to be radical, they helped reinforce the existing social order. This is especially pertinent with respect to their reassertion of a narrow gender binary. For instance, movies such as *Sholay* (*Embers*, Ramesh Sippy, 1975) celebrated male friendship and homosocial bonds but also asserted an aggressive masculinity. The angry young man’s masculinity was in sharp contrast to earlier representations of Indian heroes, who seemed almost effeminate. This shift in masculinities was accompanied by a new representation of femininity. In blockbuster hits such as *Deewar* (*Wall*, Yash Chopra, 1975) and *Zanjeer* (*Shackles*, Prakash Mehra, 1973), the good woman/bad woman dichotomy prevailed; women were reduced to the role of mother or subservient wives. These two-dimensional female figures substituted for the more robust female characters of the social film. The 1990s, however, marked some significant shifts in Hindi film representational practices.

The changes in gender ideologies I narrate below are facilitated by significant alterations in the cinema industry structure. The Indian government officially recognized the industry in 2001, changing the financing structures of cinema production quite dramatically. In 2005 the government allowed multinational companies such as Sony to co-produce Indian films. More significantly, though, in the early 1990s the Indian government started to liberalize its economy and to integrate it more thoroughly within the global capitalist system. This shift in the political economy resulted in important social shifts that are registered in cinematic representations. On another level, Indian cinema had become more aware of audiences in the diaspora and now started to consciously elicit their attention. People of Indian origin living

in Australia, North America, and the United Kingdom – what Vijay Mishra (2002) terms as members of the second diaspora – had entered the middle class in their home countries and were relatively wealthy. The turn to the diaspora makes sense in terms of revenue generation, but it also significantly altered the tenor of gender discourse. In particular women of South Asian origin are represented as repositories of “Indian” tradition; female modesty and chastity are revalorized as well (Ganti, 2004; Moorti, 2005).

Hindi popular cinema was largely addressed to the middle class (Prasad, 2001). This starts to shift in the era of the Hindi global cinema, the era of Bollywood (Ganti, 2004). Although Bollywood has been used as a short-hand term to refer to all films emerging from India, scholars have argued persuasively that it more accurately references the small slice of cinema that has gained international currency. Madhava Prasad (2003) contends that Bollywood is a “new cinema coming from Bombay but also, lately from London and Canada, which has [...] produced a new self-image of the Indian middle classes.” In this new brand of Indian cinema, Indian identity is centered in Anglo-America rather than within the geographic space of the nation-state (Gopal & Moorti, 2009).

In the new Bollywood cinema, Jenny Sharpe (2005) contends that conjugality and romance are narrated with a focus on the wealthy. Analyzing the sudden popularity of blockbuster wedding-themed films, Sharpe argues that the class conflict central to earlier romances is reconfigured in the new Hindi cinema. She identifies the film *Maine Pyar Kiya* (*I Fell in Love*, Sooraj Barjatya, 1989) as signaling the disappearance of the middle class from the Hindi cinema screen. In this film and others circulating under the name Bollywood, consumer culture and global brand names are repeatedly thematized, thus naturalizing the shift in focus from the middle class to the affluent. Class conflict is recalibrated as a clash of lifestyles, so social structural issues are reformulated as individual choices. Thus for women the adherence to Indian patriarchal conditions is positioned insidiously as a choice between a Western lifestyle and traditional Indian values. Unlike in the socials, which tended to highlight the injustices perpetuated in the name of tradition, contemporary romances present tradition as a choice women freely and willingly opt for.

The diaspora becomes the primary avenue through which this new money class enters the screen. For instance, in a film like *Dilwale Dulhania Le Jayenge* (*The Braveheart Will Take the Bride*, Aditya Chopra, 1995), the romance is between two second-generation Indians living in London, but a large portion of the narrative is staged in India. In terms of gender, the new romance films are rid of the good woman/bad woman dichotomy. Instead, aspects of the vamp figure are collapsed onto the figure of the female protagonist. Thus, before she falls in love with the hero, the female protagonist bears all the markers of being a modern, cosmopolitan subject: she is independent, opinionated, drinks alcohol, wears “Western” clothes, and so on. She displays as well the potential of sexual subjectivity. However, once she is in love she is transformed into the image of the good woman, clad in saris and suddenly acquiescent and subservient to the male figures.

The global Hindi films stage what Patricia Uberoi (2006) has identified as “an arranged love marriage” where the couple fall in love but wait for their parents’ approval to get married. This waiting period allows the narrative to insidiously insert a return to traditional values, ideas that are asserted through the female’s performance. Significantly in the new global Hindi movies, the woman from the diaspora is depicted as being more authentically Indian than those residing in the geographic space of the nation. Unlike the earlier middle-class films, Bollywood films are aimed at pleasing diasporic audiences and the cosmopolitan upper class within India. It is thus not surprising that the diasporic female subject emerges as the ideal global Indian subject. Contemporary Bollywood films have replaced competing visions of India with a banal patriotism, where lifestyle choices are seen as the most important signifier of national identity. Thus opulent weddings become one of the primary sites where the new global Indian asserts simultaneously their cosmopolitanism and their adherence to Indian tradition. Competing ideas about the nation-state have been replaced by a corporate diasporic nationalism, one where lifestyles and commodity culture become the avenues of subjectivity.

Unlike the two previous historical periods I have highlighted in this essay, in the global Hindi cinema, India and the West are no longer presented as antithetical to each other or as constituting a binary; rather, the diaspora permits a confluence. The Other or alterity, most often rural India, appears as a spectatorial backdrop against which a global Indian identity is performed.

Starting with the success of *Kal Ho Na Ho* (*Tomorrow May Never Be*, Nikhil Advani, 2003), a number of Hindi films have been set entirely in the diaspora centering around the lives of non-resident Indians (NRIs).² In these films, NRIs lead lives that are centered on other people of Indian origin; the storylines are depopulated of the local populace, who appear only as colorful aspects of the “exotic” Western landscape. Apart from advancing the idea of the arranged love marriage, the lives of these diasporic Indians has provided Hindi filmmakers the opportunity to address the topic of divorce. In films such as *Kabhi Alvida Na Kahena* (*Never Say Goodbye*, Karan Johar, 2006) and *We are Family* (Siddarth Malhotra, 2010), the women are not demonized for obtaining a divorce. This is a dramatic shift from the earlier ideas of subservience and self-sacrifice that were the essential pillars of good womanhood. On a superficial level, this seems like a significant shift in the depiction of Indian femininity. However, I contend that, like the arranged love marriage, these new familial structures provide a glossy façade for the assertion of a tradition-bound woman.

If the diaspora is the physical space where East and West meet, Indian woman becomes the symbolic site where the values associated with these regions come to reside. The films may visually present a woman who is mobile and independent but the narrative anchors this woman to an ambivalently defined set of Indian values. Contemporary Bollywood’s global Indian woman may be assertive, self-confident, and a sexual subject, but she holds on to the supremacy of the maternal principle. The new Indian femininity is recoded as a seamless blend of the traditional and the modern, exemplified in a companionate marriage. Through this new brand of NRI

films, the diaspora is no longer configured as external to the nation; instead it is recuperated within the horizons of Indians' everyday lives. India itself becomes impossible to separate from the diaspora.

Conclusion

Watching Indian films in chronological order, a viewer will be struck by the vastly different production values. Hindi films today look and sound much like their Hollywood counterparts. They are glossy and allow the viewers to participate in virtual tourism, soaking in the sights of Sydney Harbor, the Pyramids of Giza, *über*-modern Dubai, or iconic sites from the UK and the United States. Bollywood films capture in visual form the "shock and awe" induced by global capital flows. India itself is visualized quite differently. The slums and crowded cities of the past have given way to the opulent lives of global India. Bollywood films help audiences negotiate the forms of society enabled by the latest phase of globalization; they permit flexible attachments to more than one community.

But as I have argued throughout this essay, in terms of gender roles the films of the colonial era provided the most expansive and heterogeneous definition of femininities. Equally important, heterosexual romance was not always the central thematic. In contemporary films, as the Indian woman has come to look more like her counterpart in the West, the strictures of femininity have become more restrictive. On a superficial level, today's Bollywood films tell stories about cohabitating couples, divorced women, or even about women who proclaim single parenting. However, at the end of each of these narratives marriage and a heteronormative family structure emerge triumphant. Earlier films pointed out that marriages and family structures were the product of larger community desires, but today's films present these same old ideas as the result of individual choices. Without romanticizing the earlier cinema, it is important to note as well their more capacious definition of femininity. The female protagonists from today's films adhere more closely to the beauty ideals of the West. Indeed, I contend that while certain "Indian" values are asserted, today's film and film stars easily blend into a Hollywood landscape.

Equally significantly, Indian cinema's understandings of gender and Indianness have shifted considerably. Some colonial-era films presented gender and Indian identity as performative structures. Since the 1950s, though, biological explanations of national identity and femaleness have become ossified. Perhaps most insidiously, Indian female identity is cathected with Hindu identity. Indian cinema has opened up the space to address non-heteronormative sexual identities, but often in regressive ways. Outside of mainstream cinema, however, there is a growing independent industry that has offered challenges to these hegemonic ideas of gender, sexuality, and national identity. Amidst the sexily clad, thin, dancing Bollywood subjects, audiences are left longing for representations that commodify neither feminism nor tradition. The project to fashion a cinematic space for the new Indian woman remains deferred.

NOTES

- 1 Although the city is now called Mumbai, I use the older name Bombay to signal the historical antecedents of the Hindi cinema formation.
- 2 NRI is the term by which the Indian government acknowledges and solicits the economic resources of the population of Indian origin.

Portrayals of Female Scientists in the Mass Media

Jocelyn Steinke

ABSTRACT

Scholarly interest in media portrayals of female scientists has emerged as a focus of media studies research because such portrayals (1) reflect cultural views and trends related to the status and roles of women in the workforce and society, and (2) are potential sources of information and influence about future professional roles for children and young adults. This chapter traces the historical underrepresentation and gender stereotyping found in portrayals of women scientists in the mass media and describes the role these media portrayals play as factors that can limit the representation and status of women in the science, engineering, and technology (SET) workforce. This chapter also explores contemporary portrayals of female scientists that challenge gender-stereotyped claims of science as a masculine domain and examines the potential of these more progressive portrayals to broaden the participation of women in SET.

Scholarly interest in media portrayals of female scientists has emerged as a focus of communication research for two main reasons. First, media portrayals of women in professional roles, in general, reflect cultural views and trends related to the current status as well as the changing roles of women in the workforce and society (Downs, 1981; Glascock, 2001; Haskell, 1979; Massoni, 2004; Signorielli & Bacue, 1999;

The International Encyclopedia of Media Studies, First Edition.

Signorielli & Kahlenberg, 2001; Vande Berg & Streckfuss, 1992; Weigel & Loomis, 1981). Second, media portrayals of women as science professionals, in particular, are potential sources of information and influence about future professional roles for children and young adults. This chapter traces the historical underrepresentation and gender stereotyping found in portrayals of women scientists in the mass media and describes the role these media portrayals play as “important contributors to the construction and maintenance of gender stereotypes” (Lauzen, Dozier, & Horan, 2008, p. 201) and as factors that can limit the representation and status of women in the science, engineering, and technology (SET) workforce (Schmader, Johns, & Barquissau, 2004). This chapter also explores contemporary portrayals of women scientists that challenge gender-stereotyped claims of science as a masculine domain (Kelly, 1985) and examines the potential of these more progressive portrayals to broaden the participation of women in SET.

Gender-stereotyped portrayals of working women relegate women to particular professional domains in ways that both mirror the reality faced by women and simultaneously limit women’s potential for advancement and growth in the US workforce. Media portrayals of female scientists, in particular, for many years have reflected the traditional gender stereotypes seen in media portrayals of working women in other professions, specifically that have emphasized femininity or beauty (Fouts & Burggraf, 1999; Henteges, Bartsch, & Meier, 2007; Hoerrner, 1996; Lauzen & Dozier, 2002; Massoni, 2004; Neuendorf, Gore, Dalessandro, Janstova, & Snyder-Suhy, 2010; Paek, Nelson, & Vilela, 2011; Rivero, 2003), domesticity (Downs, 1981; Johnston & Swanson, 2003; Moseley & Read, 2002; Signorielli, 1982), romantic or other interpersonal relationships (Dundes, 2001; Lauzen et al., 2008; Peirce, 1997; Signorielli, 1982), and dependency on men (Paek et al., 2011). More recently, as more women have entered the workforce and as their professional contributions have gained more recognition, some media portrayals have changed to reflect both the increased presence and significance of women in the workforce (Lauzen et al., 2008). Similarly, more recent portrayals of female scientists in film and on television have changed to portray female scientists in an expanded array of professional roles that challenge traditional gender stereotypes that formerly relegated them to secondary roles subordinate to male scientists (Long, Steinke, Applegate, Knight Lapinski, Johnson, & Ghosh, 2010; Steinke 1997, 1999, 2005). Careful examination of media portrayals of female scientists is an important area of research because these portrayals provide portraits of women assuming roles that have been culturally defined as acceptable for women, while they simultaneously reflect, convey, and reinforce cultural assumptions about the role of women in society (Elena, 1997; LaFollette, 1988; Steinke, 2005).

Presenting positive portrayals of female scientists has been identified as a critical strategy for increasing the participation of women (Steinke, Applegate, Lapinski, Ryan, & Long, in press; Steinke et al., 2009; Steinke, Lapinski, Long, VanDerMaas, Ryan, & Applegate, 2009), a group that has historically been underrepresented, in the SET workforce (National Science Foundation, 2011). While the science and engineering workforce has grown at a rate faster than the total workforce in the United States

over the last several decades, women remain underrepresented in science and engineering (National Science Foundation, 2011). Recent statistics indicate that males comprise 74% of employed US scientists and engineers while females comprise 26%, with minority females and males comprising small percentages of these totals (National Science Foundation, 2011). Greater participation of women and other underrepresented groups in science and engineering is needed to ensure a diverse workforce to provide more varied perspectives to develop new questions, approaches, practices, and interpretations (Congressional Commission on the Advancement of Women and Minorities in Science, Engineering, and Technology Development, 2000).

Scholarly research in the field of communication has investigated media portrayals of female scientists as presented in a variety of media. Early studies that focused on portrayals of female scientists included those that examined representations in magazines (LaFollette, 1988, 1990; Nelkin, 1987), children's television programs (LaFollette, 1981), and newspapers (Nelkin, 1987). In the late 1990s and early 2000s, research on portrayals of female scientists centered on depictions in a wider array of media including newspapers (Fursich & Lester, 1996; Shachar, 2000), children's television science programs (Long, Boiarsky, & Thayer, 2001; Steinke & Long, 1996), PBS television documentaries (Steinke, 1997), popular films (Flicker, 2003; Steinke, 1999, 2005), and websites (Steinke, 2004). More recent research has investigated portrayals in television programming most likely viewed by adolescents (Long et al., 2010) and has linked research on media content with audience studies related to young viewers' responses to portrayals of scientists, in general, and female scientists, in particular (Steinke et al., 2006; Steinke et al., 2007; Steinke et al., 2009; Steinke et al., in press). This line of research focused on the specific effects of these portrayals on young viewers' perceptions of science and scientists and their identification with scientist characters on television (Steinke et al., in press). The following sections of this chapter trace the underrepresentation and the gender stereotyping of female scientists in media portrayals appearing in newspapers, magazines, films, websites, and on television in the United States. The final section of this chapter focuses on more contemporary positive portrayals of female scientists on television and discusses the implications for developing young women's interest in scientific and technological careers.

Who's Working in the Lab? A Look at the Numbers

Numerous media content studies focused on portrayals of female scientists often began with a simple count to compare the number of male scientists with the number of female scientists. Overwhelmingly, most of these studies reached the same conclusion: male scientists outnumber female scientists in the mass media. Studies of a variety of media, with only few exceptions, repeatedly document a higher percentage of male scientists than female scientists or show them as completely absent from scientific laboratories.

Scholars who examined press coverage of scientists were among the first to document the greater number of male scientists than female scientists in magazines and newspapers published in the early to mid-1990s. In a historical analysis of mass-circulation US magazines published between 1910 and 1955, LaFollette (1988) noted that “fewer women than men acted as communicators of science” (p. 262). LaFollette attributed this difference partly to those who wrote the magazine articles. She added that female authors of women’s magazines like *Ladies’ Home Journal* were more likely to discuss science and medicine; however, magazines for a more general audience like *Collier’s* or *Harper’s* featured few science articles by female authors (LaFollette, 1988). She explained that few female scientists wrote for popular magazines, in part, because of the limited number of female scientists at that time. LaFollette (1988) noted: “The media visibility of female scientists was understandably affected by their relative invisibility within science, for the pool of potential female authors and biography subjects was small. Although the women’s suffrage movement and employment shifts during World War I had attracted more women to the laboratories, neither the general status nor the power of women in science changed” (p. 264).

Studies of newspaper coverage of scientists yielded similar findings. Two analyses of the *New York Times* found more male than female scientists profiled in “Science Times” columns. An analysis of columns published in 1993 and 1994 noted that only 2 of the 11 scientists profiled were female scientists (Fursich & Lester, 1996). An analysis of columns published in 1996 and 1997 found female scientists were profiled in less than one-fourth of the profiles (Shachar, 2000). A more recent study of the “Science Times” examined coverage from 1980 to 2000 and found that only 16 out of 203 (7.9%) of scientists were women, and no women were explicitly classified as engineers (Clark & Illman, 2006).

Similar findings related to the underrepresentation of women scientists existed in UK press coverage. Research on portrayals of female scientists in press coverage from 12 national UK newspapers, including *The Times*, *Guardian*, *Sunday Telegraph*, and others, noted a greater percentage of male scientists than female scientists profiled (Chimba & Kitzinger, 2009). Of the 51 scientists in UK national press coverage, 84% of the scientists were male and 16% were female (Chimba & Kitzinger, 2009).

The dominance in the number of male scientists as compared to the number of female scientists occurred on the television screen as well. One of the early studies to examine gender differences in the number of televised scientists looked at television programs produced for children or shown during times when children would likely be viewing these programs (LaFollette, 1981). This study found that male scientists outnumbered female scientist characters by three to one. According to LaFollette, “Nothing actually prevents more major and minor scientist characters from being portrayed as women, other than the traditional male bias of the medium” (1981, p. 10).

Several other studies of television programs replicated and extended this early content study and documented the unequal representation of female scientists in children’s television programming. Gender differences in representation also were

found in children's educational science programs from the 1990s such as *Mr. Wizard's World*, *Bill Nye the Science Guy*, *Beakman's World*, and *Newton's Apple* where twice as many adult male scientists as adult female scientists were shown (Steinke & Long, 1996). The authors noted that the masculine image of science and of scientists as being male was further promoted by the titles of these programs: "The titles of three of these programs also suggest, either literally or figuratively, male possession or ownership of the world of science" (Steinke & Long, 1996, p. 107).

Some improvements in the representation of female scientists in children's television programming appeared to occur later. A slight increase in the representation of female scientists was found in children's educational programs from the mid-1990s (Long et al., 2001). This study noted that while two of the programs examined, *Newton's Apple* and *Bill Nye the Science Guy*, showed more adult males than adult female characters, the other two programs analyzed, *Beakman's World* and the *Magic School Bus*, did not (Long et al., 2001).

One of the most recent studies of television programs most likely to be watched by young adolescents once again indicated more male scientists than female scientists in the television programs analyzed (Long et al., 2010). Male scientists significantly outnumbered and appeared in significantly more scenes than did female scientists in 14 different television programs. These programs included *Bill Nye the Science Guy*, *CSI*, *CSI: Miami*, *CSI: New York*, *Danny Phantom*, *Dexter's Laboratory*, *DragonflyTV*, *Friends*, *Kim Possible*, *MythBusters*, *Strange Days at Blake Holsey High*, *The Adventures of Jimmy Neutron: Boy Genius*, *The Simpsons*, and *The X-Files*. Of the 196 scientist characters identified in this study, 113 (58%) were male and 83 (42%) were female. However, this study also noted that female and male scientist characters were more equally presented in educational television programs funded by the National Science Foundation than in the other television programs examined.

Like studies of children's television programming, a study of television programming content during prime time also found more male than female scientists. One study found three male scientists for every female scientist in prime-time dramas (Signorielli, 1993). This ratio was the same as the ratio found for children's television programming in the 1970s (LaFollette, 1981).

Not until the late 1990s did a study of a PBS documentary series note an exclusive focus on female scientists (Steinke, 1997). A study of television documentaries about science documented the dominance of male scientists in both number and time shown on screen for one of the documentaries examined. An analysis of an 8-hour PBS science series titled *Evolution* specifically reported differences in the amount of time female and male scientists appeared on screen when profiled in this series (Wagner & Caudill, 2003). Overall, female scientists were given only 62% of the airtime given to the male scientists. The authors found that female scientists were given 124 seconds of screen time while male scientists were given 200 seconds of screen time (Wagner & Caudill, 2003). However, the authors also examined a different 8-hour PBS science series titled *The Shape of Life* and found that both female and male scientists were shown on screen for an average of 175 seconds

(Wagner & Caudill, 2003). In a separate study of the PBS documentary series *Discovering Women*, female scientists were noted to be the sole focus of these documentaries (Steinke, 1997).

In movie theaters and DVDs, the trends in representation echoed those found in the press and on television: male scientists outnumber female scientists. According to my study of popular films from 1991 and 2001 (Steinke, 2005), only 25 out of 74 films that identified scientists as lead characters showed female rather than male scientists and engineers as lead characters. When present, female scientists and engineers appeared in a variety of film genres including action-adventures, comedies, dramas, science fiction, and horror films. Some of the films in which female scientists and engineers were featured included *Batman and Robin* (1997), *Contact* (1997), *Junior* (1994), *Jurassic Park* (1993), *Love Potion No. 9* (1992), *Medicine Man* (1992), *Nell* (1994), *The Nutty Professor II: The Klumps* (2000), *Space Cowboys* (2000), *Species*, (1995), *Twister* (1996), and others.

The findings of the many studies documenting the underrepresentation of female scientists in the mass media reflected trends in the underrepresentation of female scientists reported at US colleges and universities and in the workforce for over 20 years. Statistical information about the current status of US women scientists from the National Science Foundation noted that women still constitute a smaller percentage of those who receive degrees and are employed in science and engineering than they do in the US population (National Science Foundation, 2011). In the NSF report, *Women, Minorities, and Persons with Disabilities in Science and Engineering: 2011*, changes in women's representation from 1989 to 2008 were evident for some, but not all, science and engineering fields. For example, while women's participation has increased in the social sciences and biosciences, their participation compared with men is at medium to low levels in physical sciences and mathematics and at low levels in engineering and computer sciences (National Science Foundation, 2011). In addition, this report reveals that a higher percentage of female than male scientists were employed part time and cited family responsibilities as the primary reason for working part time (National Science Foundation, 2011).

Research on the representation of female scientists in US media appears to be of great importance in light of these statistics. Media images of scientists have the potential to influence public perceptions of scientists (Congressional Commission on the Advancement of Women and Minorities in Science, Engineering and Technology Development, 2000). Thus, more inclusive portrayals are needed to change stereotypical images and public attitudes about scientists, in order both to broaden and build a more competitive scientific and technological workforce, and to encourage and fully develop the potential of young women who can make important contributions in these fields' interpretations (Congressional Commission on the Advancement of Women and Minorities in Science, Engineering and Technology Development, 2000). The following sections of this chapter explore the varied representations of female scientists in media portrayals when they are presented.

Female Scientists in the Press: Extraordinary but Marginalized Scientist as well as a Good Wife and Mother

The earliest studies of media portrayals of female scientists examined coverage in newspapers and magazines. These studies of press portrayals of female scientists have found that images reflected conflicting societal perceptions of female scientists and views about the role of female scientists in the scientific workplace. The overall image of female scientists in the press presented female scientists as extraordinary but still subordinate to male scientists and still required to fulfill their domestic role.

Early portrayals of female scientists focused more on the unusualness of being a scientist and a woman, and prioritized female scientists' domestic abilities over their scientific abilities. In her analysis of depictions of female scientists in popular magazines in the early to mid-1900s, LaFollette (1988) argued that magazines created images of female scientists as "superstars" (p. 263), in part by featuring fewer female scientists than male scientists. According to LaFollette (1988), if not presented as "superstars," female scientists were shown as subordinate assistants to male scientists. In either of these roles, female scientists were portrayed as relatively scarce and insignificant in the world of science.

The portrayals of female scientists in these magazine biographies focused on the hard work and sacrifices experienced by female scientists and suggested that women were more fulfilled through marriage and motherhood than through their work as scientists (LaFollette, 1988). Some of the magazine biographies of female scientists focused on their domestic qualities and showed them as lacking traditional masculine qualities needed to succeed in science such as "intellectual objectivity, physical strength, and emotional detachment" (LaFollette, 1988, p. 266). Some of the images in magazine articles even suggested that female scientists in the laboratory were a potential distraction for male scientists.

A study of newspaper and magazine coverage from the 1960s to the 1980s of female Nobel Prize winners noted portrayals of female scientists that perpetuated the view that being a scientist presented a conflict with being a mother (Nelkin, 1987). According to this study, "While successful male scientists appear in the press as above the mundane world and totally absorbed in their work, the few women laureates have a very different image" (Nelkin, 1987, p. 18). A photograph of a female scientist showed her in front of her kitchen stove, and articles commented on her domestic activities such as cleaning, cooking, and selling brownies for the PTA (Nelkin, 1987). Nelkin discussed the gender stereotypes conveyed by this type of coverage: "The overwhelming message in these popular press accounts is that the successful female scientist must have the ability to do everything – to be feminine, motherly, and to achieve as well" (Nelkin, 1987, p. 20).

A later study of magazine content noted a similar focus on the conflict between being a scientist and being a woman. A thematic analysis of magazine articles published after the release of the books written by two female scientists, Rachel Carson and Theo Colborn, documented the stereotypical images created of these two environmental activists. Magazine coverage of both Carson and Colborn marginalized their scientific status either by not identifying them as scientists or by focusing on their dual identities as women and scientists (Corbett, 2001). This study noted that the dominant image of Carson in the magazine articles since the publication of *Silent Spring* in 1962 portrayed her as a passionate and emotional woman and focused on her personal rather than professional life. Corbett (2001) wrote: "Numerous stories focused on Carson's marital status and personal style, references that were used to devalue her and dismiss her work" (p. 728). Most images of Carson were unflattering: "Until her death, the picture painted of her as a woman was of an emotional, rather unstable, and reclusive woman – not someone to whom the men of science needed to pay much attention" (p. 729). Articles in news magazines also labeled *Silent Spring* as inaccurate and emotional, further discrediting Carson's competence in science (Corbett, 2001). Only after Carson's work was legitimized did magazine articles begin to mention the masculine as well as feminine qualities she possessed (Corbett, 2001).

Magazine articles about Theo Colborn reiterated the images and themes noted in magazine articles about Rachel Carson. Magazine articles that appeared after the 1996 publication of Colborn's book, *Our Stolen Future*, were more likely to recognize her as a scientist; however, magazine articles also portrayed her as biased and conjecturing (Corbett, 2001).

Portrayals of female scientists in newspapers, like the portrayals in magazines, marginalized them by focusing on their feminine and domestic qualities. A textual analysis of the "Scientists at Work" columns of the "Science Times" sections of the *New York Times* from 1996 to 1997 examined the portrayals of the female scientists profiled in this column. This study noted the profiles of female scientists presented a "gendered frame for the story" that depicted these women as individuals with an unusual interest, mentioned challenges these women faced with work and family balance, and emphasized the domesticity of women (Shachar, 2000). Additionally, the lack of female scientists selected for profiles in the press treated them as tokens, further focusing on the underrepresentation of women in science (Shachar, 2000) and reinforcing cultural stereotypes of science as a male domain.

Gender differences also were found in a study comparing profiles of male and female scientists published in 12 national newspapers in the United Kingdom in 2006. This analysis found that age, parenthood, relationship status, and appearance as related to clothing, physique, and/or hairstyle were more likely to be mentioned in the newspaper profiles of female scientists (Chimba & Kitinger, 2009). Chimba and Kitinger noted that while these descriptions portrayed female scientists in ways that break free of some of the negative stereotypes of female scientists as unattractive and unfashionable, descriptions focused on femininity could have negative

implications by drawing attention away from female scientists' professionalism and implying that they are using their sexuality to attract attention.

Female Scientists on Television: Moving Away from Marginalization and Subordination to A Lab of Her Own

Early studies of portrayals of female scientists on television primarily revealed images of them in marginalized and subordinate roles. "A Lab of Her Own? Portrayals of Female Characters on Children's Educational Science Programs" (Steinke & Long, 1996) was one of the first studies of children's educational science programs to document gender differences in the presentation of the professional status of scientist characters. Female characters in these television programs from the 1990s typically were cast in secondary roles of lower prestige in the scientific community and were often shown assisting a male lead scientist character; only one of these programs, *Newton's Apple*, featured a male actor sharing the lead scientist role with a female actor (Steinke & Long, 1996). Female scientist characters on these television programs were most often shown as apprentices, laboratory assistants, or science reporters. The authors argued that these images reflected and reinforced the cultural stereotype that promotes a masculine image of science and offered young female viewers few female role models with whom to identify. A study of similar children's educational science television programs from the mid-1990s noted more equitable portrayals of female and male scientists; female characters were as likely as male characters to be labeled as scientists and were accorded the same status (Long et al., 2001).

Public interest in increasing the representation of women in science, engineering, and technology led to television programs specifically created to promote positive images of female scientists. The PBS documentary *Discovering Women*, broadcast on PBS in the United States in 1995 and funded by the National Science Foundation, the Alfred P. Sloan Foundation, and the Intel Corporation, focused on depictions of professional female scientists. My analysis of this six-part series focused on the portrayals of female scientists in this series as related to three key issues: (1) expertise and competence, (2) balancing personal and professional responsibilities, and (3) experiences working in a male-dominated field (Steinke, 1997).

The portrayals of a physicist, biochemist, geophysicist, archaeologist, computational neuroscientist, and geneticist in *Discovering Women* shattered traditional stereotypes of female scientists. The female scientists featured in this PBS series were not only given prominent roles on television, but they also were featured in a primary role as lead scientists in prominent positions and as leaders in their respective fields, running their own research laboratories and directing their own research projects (Steinke, 1997). Comments from the narrator, colleagues, and the featured scientists in each episode accentuated the expertise of these female scientists, and the use of

the individual voices of the female scientists in *Discovering Women* speaking about their scientific research was noted as one of the most powerful techniques for highlighting their expertise, competence, intelligence, determination, seriousness, resourcefulness, and enthusiasm for science (Steinke, 1997). The author argued that the frequent appearance of these female scientists in research laboratories asserted their equal position with male peers in the scientific community and dispelled the myth that science is a career that requires masculine traits and attributes.

The portrayals of female scientists in this documentary series provided depictions of them that countered many existing traditional stereotypes of female scientists as well as the stereotypical popular depictions of them conveyed by the media up until the late 1970s. The series' focus on providing realistic portrayals of the lives and experiences of female scientists, however, also highlighted the real challenges many of them faced balancing work and family. For example, I found that "Despite the strong emphasis on the women's strategies for balancing work and family responsibilities, the tension and frustration this issue brings into the lives of many of the female scientists surfaces in half of the episodes" (Steinke, 1997, p. 423). I noted that these media portrayals of female scientists did present the women as in control of the individual decisions they made to best support their professional and personal goals.

A recent study of 14 television programs popular or likely to be seen by young adolescent viewers noted several improvements in the portrayals of female scientists (Long et al., 2010). Specifically, after studying the following programs, *Bill Nye the Science Guy*, *CSI*, *CSI: Miami*, *CSI: New York*, *Danny Phantom*, *Dexter's Laboratory*, *DragonflyTV*, *Friends*, *Kim Possible*, *MythBusters*, *Strange Days at Blake Holsey High*, *The Adventures of Jimmy Neutron: Boy Genius*, *The Simpsons*, and *The X Files*, Long and her colleagues (2010) found that female and male scientist characters were equally likely to hold high-status positions as scientists. Although shown less frequently, the typical female scientist character in these programs was portrayed similarly to her male counterpart – she was an unmarried, Caucasian adult who did not have children, and was likely to be portrayed as intelligent (Long et al., 2010). This study noted some gender stereotyping of male scientists by portraying them more often with the masculine attribute of independence; however, both male and female scientist characters were equally likely to be shown exhibiting the masculine attributes of dominance and athleticism. This study documented the progress in counter-stereotypical media portrayals of female scientists as compared with earlier media portrayals.

Female Scientists on the Big Screen: Competent, Independent, and "Remarkably Beautiful"

An examination of 122 film biographies of scientists and inventors focused mostly on portrayals of the lives of male scientists (Elena, 1993). These biopics centered primarily on portrayals of women in the medical profession and featured in traditionally acceptable roles for women as nurses. Depictions of female nurses included

biopics about Florence Nightingale, Edith Cavell, Elizabeth Kenny, and Margaret Sanger, and a couple of depictions of the first female doctors, Emily Barringer and Elizabeth Blackwell. Of the 122 film biographies analyzed, only 19 of these were female scientists, and 11 of these were female nurses (Elena, 1993, 1997). Elena (1993) noted that two of the few film biographies that featured female scientists were films about Marie Curie (the 1943 film *Madame Curie* and the 1991 film *Marie Curie*). Other film biographies about female scientists included the 1988 film *Gorillas in the Mist*, focused on female scientist Dian Fossey, and the 1983 film *Silkwood*, focused on the life of Karen Silkwood, a technician at a nuclear power plant (Elena, 1993).

In a more in-depth analysis of the 1943 film *Madame Curie*, Elena (1997) noted that in depictions of female scientists in the cinema, female scientists were “victims of filmmakers’ discrimination” (Elena, 1997, p. 272). Elena emphasized that the stereotypes presented in films influenced public perceptions of scientists at the time. In the film, Marie Curie embodies an “awkward duality required for a female scientist” (Elena, 1997, p. 276) that centers attention on both her domestic life and her professional life. The film primarily focused on Marie Curie’s romantic relationship with her husband, Pierre Curie, and was created to be a love story centered on their relationship (Elena, 1997). According to Elena (1997), the stereotype of female scientists as research assistants subordinate to male scientists is perpetuated in the film’s portrayal of Marie Curie as her aspirations are shown as secondary to those of her husband Pierre, and reinforces “feminine subordination” (p. 271). While at times the film portrayed Marie Curie as a devoted wife and mother, she also was portrayed as a female scientist of “exceptional talent” (Elena, 1997, p. 272), possessing great self-control and who was unemotional. Elena argued that the film consistently reinforces the “surprise at the phenomenon of a woman scientist” (p. 275).

My case study of the 1997 Warner Bros.’ film *Contact* focused on the portrayal of a female scientist in a lead role in the film (Steinke, 1999). As the film depicted the professional career of a young female scientist, Dr. Eleanor (Ellie) Arroway, it dispelled traditional stereotypes of female scientists by depicting Ellie in a high-status professional position as the director of a scientific research team and by presenting her as a competent, determined, persistent, talented, and committed scientist. This media representation of a female scientist, however, also highlighted the real challenges, frustrations, discrimination, and disappointments that many professional female scientists face (Handelsman et al., 2005).

The focus on the romantic lives of female scientists noted in both historical and contemporary media portrayals of female scientists also was noted in the film *Contact*. However, unlike the findings from previous analyses of films, like Elena’s study (1997) of *Madame Curie*, my study noted that depictions of the female scientist lead character did show Ellie Arroway abandoning her career or allowing her personal romantic relationship to overshadow her scientific aspirations (Steinke, 1999). In addition, I noted the significance of portrayals like that of Ellie Arroway in *Contact* that present a female scientist as a role model. I specifically pointed out the last scene of the film

in which Ellie is shown talking to a group of children about her research, providing a positive and counter-stereotypical image of female scientists.

Films have provided a wide array of portrayals of female scientists, although most of these have been stereotypical. A study of the image of female scientists in 60 feature films from 1929 to 1997 found six different stereotypical portrayals of female scientists (Flicker, 2003). These images depicted female scientists as the old maid (*Spellbound*, USA, 1945), the male woman (*Andromeda Strain*, USA, 1970), the naïve expert (*The Lost World: Jurassic Park*, USA, 1997), the evil plotter (*Indiana Jones: The Last Crusade*, USA, 1989), the daughter or assistant (*Torn Curtain*, USA, 1966), and the lonely heroine (*Contact*, USA, 1997) (Flicker, 2003). This study noted that more recent films portrayed female scientists as “remarkably beautiful” (Flicker, 2003, p. 315) lonely heroines. Flicker (2003) explained: “She has outstanding qualifications and her competence outclasses the men. She is possibly the most competent scientist in her special area. She is a modern, emancipated woman. She finds it natural to move within a male environment, and accordingly, she also has appropriated some male traits. Her greatest (or only) interest is her scientific research” (p. 315). This image of female scientists mirrored earlier representations of them found in press coverage of female scientists that depicted them as extraordinary scientists. However, this image also offered a departure from the many depictions of female scientists found on television that portrayed them as subordinate to and less competent than male scientists.

My textual analysis of 23 popular films from 1991 to 2001 examined portrayals of female scientists and engineers cast as primary characters in these films (Steinke, 2005). My analysis focused on the following recurrent themes in these portrayals of female scientists: appearance; characterization; expertise, ability, and authority; work versus romance; and work and family life balance. I found that as symbolic models that serve as sources of information about female scientists, the portrayals in these popular films reinforced cultural norms related to femininity. Glamour, attractiveness, popularity, youth, and romance were dominant themes noted in these portrayals (Steinke, 2005). However, these stereotyped portrayals also were balanced by more realistic representations that also showed female characters in professional positions of high prestige in the scientific workforce. Some of the portrayals emphasized the overt and subtle forms of stereotyping and discrimination female scientists face working in male-dominated fields:

Female scientists and engineers in professional position of high prestige in some of these films were questioned or challenged by male colleagues or peers, criticized for a lack of credentials and professional experience, experienced a loss of research funding or lab space when male supervisors failed to see the value in their research, [were] ridiculed and dismissed for taking unconventional approaches when doing science, pushed aside and silenced when providing explanations or justifications for their actions, sexually harassed when perceived as a threat by male colleagues, and pushed away as male colleagues stepped forward to take credit for their discoveries and accomplishments. (Steinke, 2005, pp. 54–55)

I concluded that these portrayals, although realistic, may focus on the challenges of being a female scientist and thus threaten girls' identification with the character and undermine their future interest in science and engineering careers (Steinke, 2005).

Female Scientists in Cyberspace: Gains in Professional Status Yet Challenges with Bias and Work/Family Balance

The proliferation of educational intervention programs to encourage girls' interest in science across the United States in the late 1990s and continuing through the present date has provided a new source of media images of female scientists on the Internet. My analysis of science and engineering websites for girls (Steinke, 2004) noted the new source of easily accessed images of female scientists and engineers available online and the potential opportunity for providing vicarious contact with role models of female scientists. Across the 27 websites identified and analyzed, 168 biographies of female scientists and engineers provided information about these women and presented images of them that focused on their work as professional scientists and engineers. I found that many of the biographies, specifically those sponsored by universities and scientific companies, featured positive images of female scientists and engineers, showing them as successful professionals who had received encouragement from their families, presenting portrayals of them in positions of high prestige in the scientific community, and describing specific strategies they have used to successfully balance work and family commitments (Steinke, 2004).

While many of these portrayals of female scientists and engineers in the website biographies presented positive images, some portrayals mentioned challenges with gender discrimination experienced both within and outside the scientific community (Steinke, 2004). I discussed the potential effects of these images on girls' perceptions of female scientists and scientific careers and the importance of media images that show women working successfully in scientific fields and competently combining work and family roles.

Conclusions

Historically when female scientists have appeared in the mass media, they have often been underrepresented and depicted in ways that have marginalized their contributions and have perpetuated cultural myths about science as an inappropriate career for most "ordinary" women (LaFollette, 1988, 1990). Media portrayals of female scien-

tists have reinforced gender stereotypes through images that downplay female scientists' expertise (Corbett, 2001; LaFollette, 1981, 1988, 1990; Nelkin, 1987; Steinke & Long, 1996), focus on the conflicts involved in balancing women's professional and personal lives (LaFollette, 1988, 1990; Nelkin, 1987), show women in professional roles as subordinate to male supervisors (Steinke & Long, 1996), suggest female scientists are a potential distraction to male scientists (LaFollette, 1988), and feature women and men interacting in ways that reveal both overt and subtle forms of stereotyping and discrimination against women (Steinke, 2005).

The absence of positive media portrayals of female scientists and the continued presentation of gender-stereotyped portrayals of female scientists serve to reinforce and maintain the myth of science as a masculine domain (Kelly, 1985). Studies of school-aged children reveal that over the years, children continue to report gender-stereotyped perceptions of scientists (see review in Steinke et al., 2007). Using the Draw-A-Scientist Test (DAST), these studies noted that when asked to draw a picture of a scientist, children often depicted a White male scientist, similar to the predominant image of scientists they see on television (Long et al., 2010; Steinke & Long, 1996). These findings suggest the influence of the "symbolic annihilation" (Tuchman, 1978) of female scientists in the media and its influence on girls' perceptions of female scientists, and possibly even on their interest in science careers. When girls do not see women scientists or when they are exposed to only negative stereotypes of women scientists in the media, they may even feel effects of "stereotype threat" (Davies, Spencer, Quinn, & Gerhardstein, 2002, p. 1615) that lead them to question their competence and to view science careers as incompatible and unachievable.

Over time, media portrayals of female scientists in some media outlets have become more varied and less stereotyped; however, female scientists are still underrepresented in many types of media. The most noticeable change that has been evident in these portrayals has been noticed in the professional status of female scientists. Many contemporary media portrayals of female scientists, particularly in film and in popular television drama programs, have been more likely to show women as the primary scientists leading a team of researchers or lead investigators rather than as research assistants or subordinates. These depictions of female scientists in an expanded array of professional roles challenge traditional gender stereotypes that formerly placed female scientists almost exclusively in secondary roles subordinate to male scientists.

Another change noted in media depictions of female scientists, particularly for those who appear on television and in film, is the focus on glamour and attractiveness of female scientists. These depictions may help dispel popular stereotypes of scientists as geeky and unattractive, and may do much to encourage more girls to consider science careers. However, these depictions reinforce a cultural emphasis on beauty for women. These images can also degrade female scientists by focusing on beauty rather than ability. Another significant change in portrayals has been a shift in focus on the domestic work of female scientists as wives and mothers to either few or no

mentions of domestic work or parenthood. This lack of focus on work and family in portrayals of female scientists provides more equal treatment as compared with portrayals of male scientists, but showing few or no working mothers in scientific workplaces also may convey a more subtle message that balancing work and family is not an attainable goal for female scientists.

Previous research has noted that it is unlikely that just one factor accounts for the underrepresentation of women in science, but rather, as one researcher states, it is a “complex interaction of factors that tend to push girls and women away” (Blickenstaff, 2005, p. 383). The public image of scientists has been singled out as an important factor in understanding the attitudes girls develop about careers in science (Congressional Commission on the Advancement of Women and Minorities in Science, Engineering and Technology Development, 2000). Cultural representations that present science as a masculine domain may lead girls to develop gender schemas that create a masculine image of science (Baker & Leary, 1995; Kelly, 1985; Maoldomhnaigh & Hunt, 1988). When girls label science careers as masculine, they may automatically exclude themselves from educational and professional opportunities in these areas (Lee, 1998). Cultural representations that present science as masculine domains also may lead boys to develop gender schemas that promote attitudes that keep them from seeing women as capable science professionals (Steinke et al., 2006). These attitudes contribute to the documented challenges women scientists have reported with unconscious institutional bias that has led to instances of covert discrimination (Handelsman et al., 2005) and subtle forms of bias in scientific workplaces (Gunter & Starnach, 2005).

It is clear that continued analysis of media portrayals of female scientists is critical for better understanding popular perceptions of the role of women in science and for challenging stereotyped assumptions about the role of women in society. Understanding the social influences of the inclusion and portrayals of female scientists in the media is important for developing all students’, and in particular female students’, interest in scientific careers. It will take ongoing examination of the array of portrayals of female scientists presented in both traditional and newly emergent forms of media in order to determine how positive images of female scientists can best promote future interest in science careers and how these images can better reflect the contributions of women in science.

“She’s the Real Thing”

Filming the Nostalgic Past through Vietnamese Women

Diem-My T. Bui

ABSTRACT

This chapter examines three US-produced films about Vietnam released post-embargo: *Heaven and Earth* (1993), *The Quiet American* (2002), and *Three Seasons* (1999). By considering the discursive construction of the films, including how the actresses participate or are represented in them, I explore variations on Trinh T. Minh-ha’s question on the Other: Who speaks? What speaks? How does the speaker establish knowledge about Vietnamese women when “speaking about” a story? Following the films’ releases, the United States and Vietnam underwent economic and political changes in their relationship that made Vietnam more accessible to multinational corporations and tourists. By constructing Vietnamese womanhood and women as available for discovery by the West in these films, Vietnam and Vietnamese women became part of the renewed accessibility and the reenactment of transnational mobility stories. The films suggest that the women’s bodies are the means of returning to an idyllic past untainted by war and global capitalism.

In director Brian de Palma’s film *Casualties of War* (1989), Private Eriksson, played by Michael J. Fox, spots an Asian woman on a bus and flashes back to his service in the Vietnam War. There begins his story of the rape, torture, and murder of a Vietnamese girl taken hostage during a raid of a suspected Vietcong village. The girl is central

to the transformation Eriksson undergoes in his struggle for justice for the girl. It is from his viewpoint that the story of the casualties and horrors of war is told and experienced. In remembering the war, Hollywood “remembers” his story or stories like his through films on the war. Thus, knowledge about the experience of war and about Vietnam is limited to these mainstream Hollywood stories. Moreover, Vietnamese women are relegated to supporting roles in their own war in most of these films. What happens when their characters speak in film? What do we learn of them, of the war, and of the country that was divided into two nations?

This chapter examines representations of Vietnamese women in three US-produced films in the Vietnam War film genre. In these three films, *Heaven and Earth* (1993), *The Quiet American* (2002), and *Three Seasons* (1999), Vietnamese or Vietnamese American actresses are central characters. All three films were released in the post-revisionist era on the war that sought to reenact the war by establishing the Vietnam War veteran as hypermasculine and revenge-seeking. The films examined in this chapter focus on different moments of the war, including before and after the war. By considering the discursive construction of the films, including how the actresses participate or are represented in them, I explore variations on Trinh T. Minh-ha’s (1991) question on the Other: Who speaks? What speaks? How does the speaker establish knowledge about Vietnamese women when “speaking about” a story?

Collective Memory-Making in Films on Vietnam

Darrell Hamamoto (1994) refers to the traumatic experience of the US failure in Vietnam as “the Vietnam Syndrome,” which describes the national citizenry’s crisis of confidence that challenged the political and military will of the United States. This crisis of confidence followed from President John F. Kennedy’s declaration of the United States as the model nation of democracy and the Free World. The contradiction between its declaration as global role model and the failure of the United States to police the spread of global communism forced US citizens to rethink their leadership position in the global arena. The Vietnam Syndrome inspired the US launching of the Gulf War as a resolution to its perceived loss of stature. Moreover, this syndrome affected media production on remembering the war. To compensate for this crisis, the Vietnam War was reenacted through Hollywood films and replayed and reworked as the US collective remembrance of the war.

In their reworking of the war, Hollywood films produced archetypal characters who dealt with major issues of the syndrome: the crisis in masculinity, in national identity, and in politics. Jeffords (1989) finds that these representations are emblems for what she terms the “remasculinization” of US culture following the war. The characteristics that are deemed important in reaching male adulthood are reaffirmed in Vietnam representation through such films as *The Deer Hunter* (1979), *Missing in Action* (1984), and *Rambo: First Blood, Part II* (1985). Because the war in Vietnam was

considered a failure, the films focused less on the war's outcome and more on the way the war was fought (Jeffords, 1989). Yvonne Tasker (1993) echoes the point that national identity is as important as masculinity in war films, particularly in the constructions of race. Vietnamese became the representations of Orientals through their invisibility, and Black Americans were the marginal representations of the literally disproportionate number of Black casualties compared to White casualties. The presence of Vietnamese characters in the films was felt, but their subjectivities were rarely developed, and only in relation to the US characters' narratives. Such invisible representations allow for reworking the memory of the war, since the US soldiers and their narratives are foregrounded or given prominence in the films. This focus on US soldiers reduces the Vietnamese to minor roles in their own civil war.

John Storey (2003) calls this fantasy revisionist narrative a Hollywood-produced "regime of truth." Vietnam War films helped to construct a memory of the war and a desire to win the war. Storey cautions, however, that productions of these meanings in the films do not necessarily mean that they were consumed by audiences without question. Rather, in order for these films to be invested in by studios, the meanings had to resonate with US audiences at a period in time when re-remembering the war in all its trauma was central for catharsis from the Vietnam Syndrome. Marita Sturken (1997) examines the power of photographic images in this memory-making and argues that they offer and create compelling versions and meanings of history. The production of meaning partly involves the process of forgetting and remembering as constitutive healing. Film is one way to achieve catharsis through collective forgetting and remembering. One such film is Oliver Stone's *Platoon* (1986). Albert Auster and Leonard Quart (1993) contend *Platoon* was a cathartic film that sought to escape from the Vietnam Syndrome that had plagued the nation since the end of the war. John Wheeler, president of the Center for the Study of the Vietnam Generation and chairman of the Vietnam Veterans' Memorial Fund, said: "The Vietnam memorial was one gate our country had to pass through. *Platoon* is another; it is part of the healing process" (Auster & Quart, 1993, p. 131).

Thomas Patrick Doherty (1993) characterizes the scholarship on gender in cinematic representations of Vietnam as in need of analysis on women. The search to examine women in Vietnam War films has been narrowly defined as US women, while the representations of Vietnamese women have been overlooked. Since film engages with our history and becomes a significant part of narrative writing on history and national identity, examining films where Vietnamese actresses play major roles allows us to see how their characters' narratives are articulated within the rewriting of history through cinematic representation.

Orientalist Logic

Trinh T. Minh-ha (1991) suggests that until we transform our society of the male-centered spectacle, we will continue to neglect the sexual oppression of women.

Thus, if we examine the spectacle of Vietnamese women in Vietnam War films, we could say that Vietnamese women will always be understood within the Orientalist logic that purports to “own” them through cinematic knowledge production. Edward Said’s *Orientalism* (1978) examines the relationship between dichotomous constructs, the West and the East, and how the discourse of Orientalism creates and maintains that relationship. Orientalism, Said argues, is produced through uneven exchanges with varying degrees of power (intellectual, political, moral, and cultural) and operates within a binary logic of West and East. In the spectacle of the Other, representation and the circulation of its meaning are dependent on the exercise of symbolic power. Vietnam War film discourse that continues to produce narratives in which Vietnamese women play marginal roles in their own war contributes to the discourse on the women as sexualized beings whose only functions are sex and death. Vietnam War films restage the war and, thus, gender representation. It is this restaging of gender in Vietnam War films, and how Vietnamese female subjectivities get rewritten and articulated in history, that is the focus of my concern.

David Desser (1991) shows us that in Vietnam War films the absence of the enemy is also an image, because it imagines the North Vietnamese enemy as a sickness within US society. The enemy is a monolithic Oriental such that images of the South Vietnamese are also images of the enemy, blurring the lines between communist and nationalist Vietnamese. Further, Desser maintains that images of Vietcong female fighters, such as in *Apocalypse Now* (1979) and *Full Metal Jacket* (1987), “feminize” the enemy so that we come to associate the enemy with the figure of a woman. Therefore, the woman-as-enemy is a major undercurrent in the United States’ attitudes toward the Vietnamese, suggesting the prevalence of racialized and sexualized bodies in Vietnam War films. Desser concludes that “even the retrospective dramatic analyses of the Vietnam War focus on *us*, on what the war did to us, on how we entered Vietnam with either good or bad intentions, but never on Vietnam as a historical site, never on the Vietnamese as genuine subjects, as people with a culture, a heritage, a political agenda, even a cultural and political confusion all their own” (1991, p. 97).

Desser’s analysis of Vietnamese subjectivity returns us to Trinh’s question on who speaks and what speaks. The films that confront the experiences of those in the war were a way for people to deal with the trauma of a war that seemed to have no cohesive logic, because it produced fractured identities, both personal and national. John Newsinger’s study (1993) on masculinity in some Vietnam War films shows that White heterosexual male soldiers’ narratives are symbolically communicated through such memorable scenes as those in Francis Ford Coppola’s *Apocalypse Now*, where soldiers surf while under fire, *Playboy* playmates perform to the soldiers in the jungle, and the Air Cavalry behaves with Western-style heroics. By speaking through these narratives, the films demonstrate their mastery or knowledge of the Vietnamese as Orientals who operate in sexual service and as body counts. Milton J. Bates (1990) argues that when films such as *Coming Home*

(1978), *The Deer Hunter* (1978), and *Apocalypse Now* were released, they helped the general public and war veterans confront the Vietnam experience and trauma. Characters of Vietnamese women, even when marginal, are important in this confrontation.

In the cinematic confrontation and reflection of the war, *Heaven and Earth*, *The Quiet American*, and *Three Seasons* attempt to take a different approach from previous Vietnam War films by offering alternative narratives to the White heterosexual male GI. *Heaven and Earth* centers its story around the autobiography of a Vietnamese woman who settled in the United States. *The Quiet American* reflects on the cause of the war through the eyes of an aging British journalist. Finally, *Three Seasons* takes a multilayered approach by narrating several different viewpoints: a Vietnamese female prostitute, a Vietnamese male cyclo driver, a young Vietnamese youth, a Vietnamese lotus picker, and a US Vietnam War veteran. The one narrative common to the three films is that of the Vietnamese woman whose sexuality becomes a product of the war. Indeed, Vietnamese women as lovers, prostitutes, and wives to US GIs were acknowledged in the media as consequences of the United States' involvement in the war. Furthermore, all three of these films abide by the myth of discovery in which the women are found to be connections to an idealized past. This myth of discovery is used by the filmmakers either in media discussions on the films or in the films themselves. Although cinematic retellings of the war could include stories of these women at its center, these stories are relegated to marginal positions. When they are told, they are shallow representations cast in images of pleasure and desire (for heterosexual US men). The Vietnam War film genre depends heavily on the trope of the Southeast Asian prostitute in constructing a narrative that explores the fractured masculine identity.

The trope of the Southeast Asian prostitute is rooted in the long history of Asian women serving as lovers for Western males, both in fiction and in reality. US involvement in Asian conflicts had set the conditions that made possible sexual encounters between Asian women and US soldiers in prostitution and in marriage. In Hollywood cinema, the Southeast Asian prostitute is an exoticized and eroticized figure. Her function as a sexual being for Western males is most essential to the narratives, because her character establishes the line between masculinity and femininity (Jeffords, 1989). Whether the prostitute is a sex worker in a night club or a girlfriend considered a body for sexual use and abandonment, the consequence of this trope in films is that the prostitute's situation frequently ends in violence (death or abuse) or a dead end (she remains a prostitute). She is positioned as the disposable feminine Other in contrast to the masculine White Westerner with whom the film offers the spectator identification. The sexual experiences of the main female characters echo the elements of this trope but the women end up either transcending their situation or being resigned to it. Moreover, press coverage of the films often reenacted elements of this trope through gendered representation of the actresses.

Dramatizing a Vietnamese Woman's Story: Oliver Stone's Vision of *Heaven and Earth*

Oliver Stone's cinematic adaptation of Le Ly Hayslip's autobiographies, *When Heaven and Earth Changed Places* and *Child of War, Woman of Peace*, is his third film in a trilogy on the Vietnam War, following *Platoon* and *Born on the Fourth of July* (1989). *Heaven and Earth* was released domestically in December 1993 and made just less than \$6 million. In an interview, Stone made clear that the film was his attempt to present a lesser-known narrative about the Vietnam War when he stated that Hayslip's story was "a different side of the war for Americans. Here was a story of a way of life that none of us knew or cared about when we were in Vietnam" (Hoover, 1994, p. B1). In his previous films, Stone drew on his personal experiences as a GI during the Vietnam War to represent a realist perspective and fractured masculinity on the big screen. *Heaven and Earth* was not simply about representing a "different side of the war" but also about supplementing Stone's own struggle to understand the war: "Making *Heaven and Earth* rounded out my own experience in Vietnam [...] It's the story of the villagers and that's the story that we American soldiers didn't understand" (Hoover, 1994, p. B1). Stone consulted with Hayslip to write the screenplay and direct the film. He credits her participation in the creation of the film to his increased understanding of the Vietnamese and their philosophical views: "Thanks to Le Ly, I came to understand the Vietnamese people and their close connection to their ancestors and their land" (Hoover, 1994, p. B1).

The film centers on Vietnamese Hayslip, played by first-time Vietnamese American actress Hiep Thi Le. Its opening shots show Hayslip's home village, Ky La in central Vietnam, depicted as an idyllic place prior to the French colonization of Vietnam. Le's character narrates her journey from Vietnam, just before the start of the Vietnam War, to the United States after the war, and finally back to Vietnam. Along the way, Le is tortured and raped by soldiers, impregnated by her employer, and eventually married to a US soldier played by Tommy Lee Jones, who takes her to the United States. The epilogue of the film finds Hayslip years later as a successful business woman who, for the first time since leaving, returns to Vietnam with her sons. Back in Ky La, she meets a villager who tells her that "rebuilding a nation after war is like trying to start a family by getting raped!"

Stone's understanding of Vietnam and the Vietnamese leans toward romanticizing a Vietnam prior to the communist takeover and to the US intervention in the war. Mariam Beevi (1997) argues that Stone, and Hayslip through her texts, stages the "Vietnamese American experience" in which two cultures, "Western" and "Eastern," are seen as mutually exclusive in moral and religious beliefs. The film's opening sequence suggests a heavenly place where fields are lush and green, families are intact, and Buddhism and peace govern the people. It is the village of Ky La where

Hayslip spent her early childhood years happily with her family. In order to portray the nostalgia for village life, Stone sent his actors to Ky La, where they learned about living in this traditional farming village. In his staging of Hayslip's story, Stone creates an archetype of a Vietnamese American woman who "has to overcome anger, ambition and particularly, sexual promiscuity epitomized by prostitution; she must purge herself of these 'Western' influences and regain her 'Eastern spirituality,' in turn redeeming her 'nationality'" (Beevi, 1997, pp. 43–44). Like the US Vietnam War films that represent a masculinity fractured by the experience of war, Beevi asserts that *Heaven and Earth* presents a fractured femininity that can be healed through Hayslip's transformation as a "new international immigrant woman" who recaptures her spiritual and ancestral traditions. Further, by presenting Hayslip's story as a return to "home," Stone rewrites the narrative of nation-building on her body through her loyalty to her US husband (even as she divorces him) and to her children.

Hayslip's body is central to the story she tells as a refugee woman, because the body is where issues of nationalism and national conflict are inscribed. Whereas Beevi suggests that Hayslip's body is the instrument to show the return to familial duty as nation-building, Leslie Bow (1994) argues that Hayslip's feminine sexuality is the conduit through which national conflicts are defined. Bow claims that Hayslip's political allegiance is established in the commodification of her sexuality. Viet Nguyen (1997, 2002) concurs that Hayslip's body is necessary in the narrative of the refugee for the United States to come to terms with this immigrant population. For Nguyen, representation of Hayslip's body as a victimized one makes it possible for US audiences and readers to understand Hayslip's experience more fully. These scholars point out that the focus on corporeality is a narrative device in the telling of Hayslip's story of the refugee for Stone's audience.

Other Vietnamese women in Hayslip's story are just as central to telling the refugee experience through the body. Their characters in the film also contribute to the construction of Hayslip's gendered body. Hayslip's mother, Mama, is a constant reminder of her duty to the family and of the importance of chastity. Mama shows little warmth toward her daughter, but offers Hayslip her approval at the end of the film by saying that Le Ly has completed her circle of growth and that Mama's destiny as her mother is over. Kim, Hayslip's sister, is the wayward Vietnamese woman commodifying her body in a brothel for US GIs during the war. She later marries a physically abusive GI and moves with him to the United States. Madame Lien is the heartless wife of Le Ly's employer, the Master, who orders Le Ly to be sent out of the house for being impregnated by him. These three female characters – Mama, Kim, and Madame – are the various paths of womanhood and help to construct Hayslip's body as a site for the negotiation of national identity. In other words, they represent what Hayslip has either chosen not to become or not been allowed to become as a Vietnamese woman. They are the boundaries of her womanhood by instructing Hayslip on her virtue and her duty as a woman and mother. In this sense, Vietnamese womanhood is constructed through the several female characters in the film who are each suffering victims in their own way. Judith Butler (1993) asserts that

it is this reiterative discourse that makes, regulates, and constrains sexuality. Hayslip is defined against the repudiation of the three supporting Vietnamese female characters. That is, these women are excluded from the redemption Hayslip receives in the end because they are resigned in their suffering, unlike Hayslip, who is portrayed as the courageous immigrant woman who works her way out of her situation. Hayslip is not constructed in isolation but, rather, in what Butler maintains is a performance of multiple articulations of norms or set of norms. A normative heterosexuality is established through this performance. Hayslip's numerous affairs with men, both in the book and in the film, help to construct Vietnamese womanhood as a necessary return to familial duty and virtue. The story that Stone offers his audience is part of a discourse of normativities that collectively produce an immigrant woman's narrative of struggle and redemption. The immigrant/refugee narrative is one about individuals who work hard to achieve success – the myth of the model minority. Moreover, this type of narrative suggests that immigrants are able to access an authentic past described in Stone's film as a prewar, pre-border crossing, and an agrarian-based life.

Also central to understanding the narrative of the film is press coverage about the film. The refugee narrative is used to describe actress Hiep Thi Le's connection to the story. A LexisNexis keyword search on Le produced only a few articles, which described her as a new actress. Some of the newspaper coverage addressed Le's personal experience as an immigrant:

What begins as a fable becomes a grand opera, then soap opera. Le Ly, bravely played by Hiep Thi Le, herself a boat person who left Vietnam in the late '70s, is narrowly defined as a career victim. (Gabrenya, 1994)

Hiep Thi Le has been there, too. She was born in Vietnam. In 1978, her family began fleeing the country in stages: Le and a younger sister soon joined the "boat people" bound for Hong Kong and spent three months in refugee camps. (Giles, Duignan-Cabrera, & Peyser, 1994)

Stone cast her because "she was so unspoiled." And that's precisely why directors have taken the trouble to make stars from scratch. Directing nonactors, says Neil Jordan, [...] "is like working with a child. There's a sense of reality there. There's no technique." (Giles et al., 1994)

Stone seems to have discovered the unspoiled Vietnamese woman in casting Le, who appears to be Stone's authentic representation of a Vietnamese woman untainted by the consequences of war and Western influence. It is also through the immigrant narrative that this discovery is structured. For instance, the *Chicago Sun-Times* published an article solely on Le and how the film was something to which she could relate: "The story hit home for Hiep, who was one of Vietnam's boat people" (Pearlman, 1994, p. 2NC). Le is seldom presented as an actress based on her merit, but rather as an actress who had to draw on her similar experience as a Vietnamese refugee to play the part. Paralleling the film, the narrative in these articles also

focuses on the individual, where the context of family, friends, and historical events is neglected in the retelling. It is similar to the "pull-yourself-up-by-your-bootstraps" notion that is part of the myth of the model minority of Asian Americans in which the media depict Asians in the United States as being ideal racial minorities who became successful as a result of individual will and determination. In the media surrounding the film's lead actress, Le is depicted within the immigrant/refugee narrative like the lead character, Hayslip, without venturing beyond a story about her hard work to achieve her US success. It is her "unspoiled" exposure to Hollywood and her experience, her authenticity, as a boat person that the media and Stone declared to be relevant to the film. In framing the actress as a discovery, Stone takes credit for finding the actress and giving her the opportunity to showcase her communication of her refugee experience.

Stone brought to mainstream audiences in the 1990s a Vietnamese woman's story that is translated to audiences into a refugee success story and a gendered national identity. Further, the Vietnamese American actress who plays this woman in the film is also made to fit into this same story. Hayslip's sexuality is defined through the film's management of the other Vietnamese female characters' sexuality in the film. For instance, Hayslip does not sell her body like her sister, even when offered a large amount of money. By not commodifying her body to the GIs, Hayslip may recoup her compromised sexuality. As with the overplayed trope of the Southeast Asian prostitute, Hayslip underwent similar experiences of rape, affairs with White men, and having their children. However, Hayslip ends as a success story and offers a reconciliation of past conflicts between the United States and Vietnam and between old and new Vietnam. Both Hayslip and Hiep Thi Le's stories have been commodified as selling points in Stone's vision of the Vietnam War and its aftermath. Hayslip's identity as a refugee has been bounded and regulated by the sexualities of the women in her story and the story that Stone rewrites for the screen.

Around the time this film was released in late 1993, Vietnam was reemerging in the news as the United States began to lighten up on its previously rigid stance of no reconciliation with Vietnam imposed shortly after the end of the war. Matthew Killmeier and Gloria Kwok (2005) maintain that because Stone's film was released during a time of reconciliation between the two nations, the film contributes to "the American recuperation of Vietnam as an object of neoliberal imperialism" (p. 269). That is, as the United States normalizes its relations with Vietnam through renewals of trade and tourism, the success story of Le Ly Hayslip reads as part of the cultural incorporation of Vietnam in the United States' neoliberal empire. Discourse on Vietnam in the 1990s described the country as a more accessible place after the war. The refugee narrative and the trope of the Southeast Asian prostitute in *Heaven and Earth* aid in representing Vietnam and Vietnamese women as part of this renewed accessibility and the reenactment of a transnational mobility success story.

Oliver Stone adapted *Heaven and Earth* during a significant shift in Vietnam-US relations in which the two countries began a reconciliation of the past. Also during this time, Vietnamese Americans were a new addition to the model minority myth

through the immigrant/refugee narrative. This narrative was echoed in the casting of the lead actress and the press coverage of her own life story. Reconciliation in the 1990s and in the film referred not only to the resolving of conflicts between Vietnam and the United States, but also to reconciling Vietnam's present with Stone's vision of an authentic, mythical old Vietnam. The refugee success story, in conjunction with the trope of the Southeast Asian prostitute, constructs Vietnamese women as available for discovery by the West, which just has to search for the "unspoiled" Vietnamese woman. The trope polices the sexuality of Vietnamese women by framing it as a woman's choice to commodify her body and contrasting it against the choices of the other female characters. National identity and authenticity are inscribed on women's bodies and heralded as the paths toward immigrant success.

The Quiet American: Phillip Noyce's Critique of War

The 2002 cinematic interpretation of Graham Greene's 1955 novel *The Quiet American* is, on the surface, a film about the political and personal influences of a journalist's coverage of the beginnings of a war. Media discussion of the film placed it as a timely critique on US foreign policies following the 9/11 attacks on the United States. However, contextualizing the film within the history of Vietnam films by the United States and within the framework of a gendered Western gaze offers a different reading. In its fictionalized story of reporting the events leading up to the United States' Vietnam War, the film uses romance as a narrative device to communicate knowledge about Vietnamese women to the US viewing audience.

Three decades after the end of the Vietnam War, cinema continues to contribute to the ongoing moral, political, and social debates surrounding the United States' involvement in that war. US films on Vietnam overwhelmingly are about the experiences of US soldiers in the war (for partial bibliographies of these films, refer to Dittmar & Michaud, 1990; Whillock, 1990). More than depictions of history, these films represent current attitudes about the war such that they create a sense that this war has never ended (Anderegg, 1991). The filmmakers of *The Quiet American* acknowledge their film's participation in US understandings about its role in the Vietnam War. Director Phillip Noyce, in explaining his reasoning for adapting the book into a film, comments that it was "the great Vietnam War movie that hadn't been made. A film not about the experiences of fighting the American war against the Vietnamese, but a film that explains why the fighting occurred, why the Americans prosecuted that war over such a long period with such vehemence" (Bffc.net, 2002). Furthermore, the filmmakers suggest that the film has relevance to policies about war in general and is a caution against jumping into war. This film, read within contemporary political events, indicates recent public sentiment about the United States as a meddler in world affairs and connects the Vietnam War to the Second Gulf War. In an interview, Noyce made this connection in his comment on the

character of Pyle, saying "George [W.] Bush is the ultimate Alden Pyle!" (Tang, 2003). Noyce expanded: "The issue is whether America's responsibility to the rest of the world justifies meddling in the internal affairs of other sovereign nations. We are facing that question with Iraq" (Gorbach, n.d.).

The film narrates a love triangle between a middle-aged English journalist, his young Vietnamese mistress, and a young US doctor in 1952 Saigon on the eve of United States involvement in the Vietnam War. The story is told through the eyes of Thomas Fowler, who lives with his Vietnamese mistress *Phuong* but is married to a Catholic woman who remains back in England. Fowler and *Phuong* meet Alden Pyle, who tells them he is a doctor who specializes in eye diseases. Fowler eventually discovers Pyle is a US spy. Pyle falls in love at first sight with *Phuong*. From that point the film describes two parallel stories: the story of the love triangle of Fowler, *Phuong*, and Pyle, and the story of Fowler's uncovering of secret US dealings with the South Vietnamese against the communists, which ultimately lead to the Vietnam War.

The film's love triangle is a metaphor for the Western world's intervention in Vietnamese governance and politics. *Phuong* stands in to represent the nation of Vietnam, while Fowler and Pyle are the well-meaning men who intend to save *Phuong* from her limited occupation as a dancer catering to foreign men. This behavior is most evident in the scene in Fowler's apartment where the men argue with each other over who can take better care of her while *Phuong* looks on. After the argument, the choice finally is posed to *Phuong*, who decides to stay with Fowler out of loyalty to him. As a metaphor, *Phuong* is passive, helpless Vietnam while Fowler is the benevolent (aging) Western colonizer and Pyle is the new imperialism of the United States. The film works on another metaphorical level through the discourse surrounding it. An examination of media discourse on the film shows an emphasis on the political opinions of the male filmmakers and actors. Cynthia Fuchs (2003) points out that despite *Phuong* being a major character in the film, the media neglected to address the role she plays as the object of men's desires. Indeed, interviews and press conferences focus more heavily on Brendan Fraser and Michael Caine, who play Pyle and Fowler, respectively. Moreover, Do Thi Hai Yen, who plays *Phuong*, is not presented in interviews as having deep insights into her role, while both Caine and Fraser speak in-depth on their roles. Actors Caine and Fraser discussed in interviews and in the director's commentary on the DVD release how they came to realize their characters, Caine bringing his experience in the Korean War to the film and Fraser researching the history of Vietnam for the film. One of the few anecdotes revealed about Do Thi Hai Yen coming to play this role is that she is the girlfriend of the actor Quang Hai, who plays General The, and doesn't speak English (Bffc.net, 2002). At the movie premiere, Fraser offered his view of Do: "Greene created *Phuong* as a symbolic representation of Vietnam. Do Thi Hai Yen represents great Southeast Asian dignity and beauty" (Vietnam News Agency, 2002). Her experience of making the film is voiced almost entirely by the director, Fraser, or Caine, and her thoughts on the film's message are completely absent from media discussion on the film.

Karen Shimakawa (2002) argues that when Asian American actors perform Asian roles for US audiences, they bring with them a history of images that imbue the

Asian body with Orientalness. Indeed, the reason Do was chosen for this role appears to be because she embodied this Orientalness. Noyce explained why he chose Do, who had no previous acting experience, over 500 other Vietnamese women from all over the world who auditioned for the part: “She’s the real thing [...] The Vietnamese diaspora had all been changed and polluted by the desire to be American or French. Because she had been locked away for so long, she really was a Vietnamese woman from the fifties. She has a certain reserve, she has a dignity” (Noyce, 2002). Noyce articulated Do as an authentic representation of Vietnamese women of the 1950s and, by doing so, contributes to the production of knowledge on Vietnamese womanhood as rooted in the exotic Orient, the Miss Saigon or the Vietnamese Madame Butterfly. Noyce confessed in an interview that a Vietnamese female friend of his voiced her criticism of the portrayal of Phuong, arguing that Phuong would not have found it as easy to leave Fowler for Pyle as shown in the film but would have been tortured by her feelings of loyalty (Gorbach, n.d.). By choosing not to allow Phuong the depth and complexity he does with Fowler and Pyle and by the limited discussion in the media of Do’s contribution to the film, Phuong remains a mere narrative tool in a love triangle story that serves as a metaphor for players in war. Phuong succeeds as the object of desire of these two men, because she fits into the Oriental romance structure in which Lisa Lowe (1991) explains that both the woman of desire and the Orient are located as an Other, inaccessible and different. Phuong’s passivity and ultimate resignation to her situation at the end of the film are made plausible as they fit her into what Gina Marchetti (1993) describes as a long history of Orientalist representations of the Madame Butterfly figure. Like Madame Butterfly, Phuong is an Asian woman who falls in love with a White man and submits to his authority. She is shown in the film as being suspicious of Pyle’s activities but is allowed neither the space nor the disposition to question them.

The media discussion and the filmmaker’s own comments on the film privilege a Western gaze of war over a more encompassing understanding of war’s deep embeddings in the politics of race and gender. This Western gaze is both masculine (trumping any female participation in discussions) and imposing. Self and agency of the Vietnamese female are erased by the film’s depictions of Vietnamese women and by its media discourse – the women are intended for sexual service for US men. Susan Jeffords argues that the discourse on the Vietnam War redefines constructions of what is masculine and feminine “so that women are effectively eliminated from the masculine narration of war and the society of which it is emblem, either by the masculine point of view from which the stories are told or by themselves as exiled ‘refugees’ from U.S. social relations” (1989, pp. 185–186). Information about Phuong, Do, and Vietnamese women is confined to what the filmmaker and media choose to dispense.

The film ends with newspaper headlines on the French withdrawal from Vietnam, the communists declaring war on South Vietnam, and the United States entering the Vietnamese civil war. The technique of flashing newspaper headlines at various points throughout the narrative attempts to imply the film as a report of the political events prior to the war. In doing so, *The Quiet American* reports an idea of the authentic Vietnamese woman to the US public through a reliance on photojournalism as

the communication of reality. Phuong’s reserve and resignation to her fate, as created by the men in her life and by the political events, demonstrate that even if Phuong did “speak” for herself, her fate is decided by the men and the political events. A love triangle as a metaphor for US foreign policy positions Vietnam as the feminine counterpart to the United States as self-declared protector and hero. In both the love triangle and the film’s version of Vietnam’s role in the war, Vietnamese women and Vietnam have no choice but to play out their destiny as pawns in the lovers’/Western political agenda. To further understand the representation of the West, the film underscores the ages of Fowler and Pyle as metaphors for the shifts within Western power. Fowler, the older man, represents the aging British Empire, while Pyle’s youth, in contrast, suggests the rise of US imperialism. Media discussion on the film also interprets Phuong and Do as passive women. It is possible to invert such interpretations to discuss how Phuong might be fully aware that Vietnam is changing and that she makes choices based on an awareness of her country’s revolution and her own condition. Yet what we see instead is an adherence to the trope of the Southeast Asian prostitute, who is represented with little complexity and functions as a character to further a director’s statement on a different war.

While filmmakers and media characterized the film as more of a commentary on war and a caution against entering wars, I suggest that the film participates in a rearticulation of the colonialist framework of Orientalism. Interestingly, the film calls out the meddling of the United States overseas and makes transparent US interference in prolonging a long and bloody war. However, the problem is in the interpretation of Vietnam, symbolically represented through the female character, Phuong. As a subaltern, Phuong’s ability to speak is managed by the men, symbolically representing competing Western nations. In media discussions on the film, the filmmakers had an opportunity to delve further into US foreign policy and to go beyond a critique of the United States as simply acting as cowboys and sheriffs in global politics. The film services the United States’ neocolonialism by failing to interrogate the gendered relations in the love triangle and by advertising Do Thi Hai Yen as an authentic Vietnamese woman who, in her “authenticity,” creates what Trinh T. Minh-ha calls “the desire to acquire and protect it” (1989, p. 88). The gendered relations at the geopolitical level go unchallenged, while neocolonialist constructions of knowledge of the female Other remain intact.

Three Seasons: Tony Bui’s Imagining of Vietnam’s Future

In his memoir *Jarhead* (2003), Anthony Swofford describes his experience serving in the US Marines. He explains that the appeal of watching Vietnam War movies would incite the soldiers to violence. He writes: “All Vietnam war films are pro-war no matter what their supposed message [...] The magic brutality of the films celebrates

the terrible and despicable beauty of our fighting skills.” Despite a film like *Apocalypse Now* being ultimately an antiwar tale, many films about the Vietnam War offer an eroticization of violence in warfare. For the men in *Jarhead*, the littering and disposal of bodies in Vietnam War films operate through an objectification of the enemy body. For example, the extended rape, torture, and murder of the Vietnamese woman in *Casualties of War* offer no narrativization beyond her body’s sexual function. Viet Nguyen (1997) describes scenes such as these as a pornographic spectacle of death for Vietnamese viewers. In other words, they identify with the dead bodies that are objectified and sensationalized as enemy bodies in warfare. Filmed in the midst of a dramatic economic and cultural shift for Vietnam, the 1999 film *Three Seasons* is an attempt to move the focus on Vietnam from the US perspective of a pornographic spectacle to Vietnamese perspectives.

Vietnamese American director and writer Tony Bui intended to create a feature film that would showcase Vietnam to US and international audiences. He wrote *Three Seasons*, which was filmed mostly in the Vietnamese language. Americans, here, mainly are extras who are driven around the city in cyclos, while Vietnamese fill most of the leading roles. *Three Seasons* was the first US film given permission by the Vietnamese government to be filmed entirely on location in Vietnam since the war. Released in 1999 by October Films, *Three Seasons* was well received in its showing at the Sundance Film Festival, grossing over \$2 million and showing in 66 theaters in the United States.

The film follows four narrative threads of Vietnamese characters and one American man in Saigon, a.k.a. Ho Chi Minh City. Kien An, a young woman, goes to work as a harvester in the lotus ponds where she meets a reclusive teacher, The Dao, living in a temple in the middle of the pond. Cyclo driver Hai falls in love with the prostitute Lan, who longs to live the life of people in air-conditioned hotels. Named after his Woody Woodpecker t-shirt, Woody is the 8-year-old boy who works the street at night to sell trinkets to tourists outside of bars. James Hager is the US veteran in search of his Amerasian daughter, whom he knows only by a photograph.

A review in *Sight & Sound* (Macnab, 2000) criticizes the film for its discontinuity in editing when the film jumps from scenes of rain to scenes of clear weather. The reviewer misses the point of the main theme of the film, made obvious by its title, *Three Seasons*. In Vietnam, only three seasons are recognized: dry, wet, and growth. Tony Bui intended the seasons as a metaphor for the cyclical changes in Vietnamese culture. He described the influence of his personal journeys to Vietnam, which shaped his impression of Vietnamese culture and eventually his filmmaking: “Visually, I was so struck and affected by what I saw. There were so many changes. It’s a country going through a stage of influence. In 1992, there were Russian ships and kiosks everywhere. By 1997, all of that was gone, replaced by Coca-Cola and Pepsi signs and taxis – taxis didn’t even exist in Vietnam in 1993. From 1992 to 1997 there was a dramatic change and influence, and it was all Western” (LoBrutto, 1999). This Western influence Bui describes is represented throughout his film by the large Coca-Cola and Maxwell billboards decorating the Ho Chi Minh landscape, camera shots

of towering skyscrapers in the process of being built, and the proliferation of hotels catering to wealthy foreigners. The transnational corporate presence in Vietnam was made possible in part by the Clinton administration's lifting of the US embargo on Vietnam in 1996. The removal of the embargo accelerated the growth of US trade with Vietnam and its exploitation of Vietnam's labor resources.

Bui works the theme of economic and cultural change in the film not only in the background but also within the stories themselves. Kien An, the young woman who finds employment as a lotus harvester, wanders the street every day to sell her bundles of flowers, which she carries in baskets across her shoulders. One day she notices a group of men selling lotus flowers from the back of their truck. The flowers are plastic, mass produced, and cheaper to buy than the real ones. The film reveals its nostalgia for the days prior to mass-produced plastic flowers when women labored in ponds to handpick each blossom. This nostalgia reappears when The Dao, the reclusive teacher hiding his disfigured body from the world, desires to hear the song the women in the floating market of his childhood sang, which Kien An sings as she harvests the flowers. He describes his longing: "I had forgotten my youth, the only time I was pure and whole, until I heard your song."

Woody, the child, represents the potential of a lost childhood. He works at night selling souvenirs in such places as the famous bar *Apocalypse Now*, and gets drunk for the first time when James Hager offers him beer. However, he has moments of a child at play. Later, he is shown play-acting in a Western gun fight; he watches cartoons in electronic stores and joins in a street soccer game. All these activities evoke the nostalgia of youth.

This longing for youth is reiterated in the story of the prostitute, Lan. She recounts to Hai, the cyclo driver, stories of her school days when she wore a white *ao dai* and walked along a beautiful grove. Hai tells her that there are better ways for her to make money than through prostitution. Lan replies that she dreams of living the life of people in hotels. She says, "The sun rises for them and we live in their shadows," admitting that she would marry one of them just to gain that lifestyle. Lan's character suggests a desire to fulfill constructed needs, in which she believes the luxurious life of hotels is the epitome of an ideal lifestyle. Such a constructed desire may be the result of this global capitalist expansion into post-embargo Vietnam. In the end, she returns to walk in her garden grove in her white *ao dai* after she has given up being a prostitute.

The film implies that it is possible to erase the effects of war and capitalism on one's life if one chooses to. Kien An decides to return to the floating market of The Dao's childhood where factory-made flowers have yet to dominate. Lan renounces her life of prostitution, dons the dress of her school days, and accepts the life she has. Woody continues with his youth and gains a young friend. James Hager finds his daughter, who has become a *bia om* girl, a woman who serves as a date for men in bars. He tells her that he intends to do right by her. Hai remains as he was at the start of the film, a cyclo driver with a good heart. The moral is that he ends up with his object of affection because he remained true to his sense of self.

This theme also appears in Nguyen Du's classic nineteenth-century Vietnamese epic poem, *Truyen Kieu*, or *The Tale of Kieu*, about Kieu, a woman who is passed from man to man, from marriage to prostitution, and to a new, but platonic, lover. Through it all, she fulfills her familial duties to her father and lover and retains her sense of obligation as a woman. This poem remains popular for Vietnamese in Vietnam because it is a metaphor for Vietnam, which endured centuries of outside invasion by Chinese and French colonialism and US imperialism. Prostitution is Kieu's moment of submission, but she is able to recoup herself by marrying a man for whom she has only platonic feelings. *Three Seasons* appeals to this romanticized notion of a nation through the character of Lan, who engages in the immorality of prostitution but later forsakes it. Darrell Hamamoto's (2000) examination of *Three Seasons* posited that Lan's character is a metaphor for a recuperation of Vietnam's fall from grace following the war. He argues that the film implies a post-imperial Vietnam is available for pimping to transnational corporations when the film captures the symbols of capitalist development – advertising billboards and the building of skyscrapers. Lan, like Kieu, persists through difficult times by selling her body. She is a modern Kieu living in a country that is being quickly integrated into a global capitalist economy. While I agree with Hamamoto's conclusion that the film puts forth Vietnam as available for “pimping” to transnational corporations, I also argue that Bui offers his film as a way to suggest how Vietnam can retain its identity in the face of social crises resulting from the inevitable capitalist integration.

Three Seasons distances itself from US films on Vietnam that objectify Vietnamese bodies, particularly women's bodies, in an attempt to reconcile its traumatic experience of the war. As Marita Sturken (1997) suggests, the Vietnam veteran's story is ever present and is a form of memory. This selective memory dominates over and rewrites the Vietnamese story for the veteran's catharsis. *Three Seasons*, on the other hand, has Vietnamese characters with stories that do not depend on the objectification of their bodies for audiences. There are narratives about Vietnamese women that indicate more than the function of their bodies for sex and death – that is, they are depicted as making choices in a rapidly changing society. However, the objectification of bodies that does occur in the film is in the nostalgia of bodies in labor prior to the war and integration into the global economy. The manual labor of Kien An and the renunciation of Lan's sexual labor promote a return to a past prior to an economy marked by flexible accumulation and capitalist exploitation of third world labor. Yet a return to this past in reality is impossible because Vietnam itself cannot reverse its accelerated integration into global capitalism.

For director and writer Tony Bui, social change is cyclical, like the changing of seasons. *Three Seasons* resolves the social dilemmas (prostituting one's self and conspicuous consumption) that arise from the expansion of capitalism into Vietnam by suggesting that one can choose to remember the past and choose to live true to one's principles. At the end of the film, Hai hands Lan the book he has been seen reading throughout the film. The title of the book finally is revealed to the audience. It reads in Vietnamese: “Ren Nhan Cach” (translated as “be persistent in living a moral life,”

a modern Vietnamese self-help book). The past that *Three Seasons* desires is an idealized past. The film disregards the new labor complexities that result from Vietnam being thrust into global capitalist expansion after the lifting of the embargo. The demand for prostitutes and *bia om* girls only grows as more foreigners invest in the country and hotels continue to rise to accommodate them. It is likely that Kien An and other women in her socioeconomic position eventually will have to find low-wage work in one of the many transnational factories made possible by flexible accumulation. *Three Seasons* invokes a classic Vietnamese text using a woman's body as metaphor for a nation and, thus, includes Vietnamese and Vietnamese Americans in a story of Vietnam that takes into account the war and the experience of a country in capitalist development. It expands representations of the Vietnamese subjective experience by not resorting to the pornographic spectacle of dead or dying bodies. While giving more narrative substance to Vietnamese, the film makes Vietnamese women coherent and complete only when they have epiphanic moments of returning to a mythic and idealized past. It implies that, like *The Tale of Kieu*, one can return to an authentic culture and salvage one's virtue even after being exposed to immoral practices. *Three Seasons* engages with the past by claiming that a return to it is natural because social change is cyclical. It offers more depth to the Vietnamese affected by the war. However, the influence of capitalist intervention and the global flows on cultural and national identity remain unquestioned in this film, and this notion of the cyclical nature of society leaves us with the impossible quest for an authentic past.

Conclusions

While *Three Seasons* broadened representations of Vietnamese women in sex and death, all three films, either in the film narratives and/or in media discussions on the film, construct Vietnamese women's bodies as portals for an authentic Vietnam that existed prior to the United States' memory of war, colonization, and advanced globalization. Earlier Vietnam War films articulated an abstract Vietnamese woman who functioned more as a body count in the US soldier's narrative. As Vietnam and the United States began to normalize their economic and political relations in the early 1990s, the films carried a nostalgia for an idealized past. US multinational corporations are seeking to open operations in Vietnam, while tourists find it to be an affordable and exotic locale. Vietnam has been rewritten to be open and accessible to global capitalist investment, while Vietnamese women are portals to an idyllic life prior to US military intervention and the crisis of national identity. The three films examined here depart from other Vietnam War films by incorporating Vietnamese women's characters as central to the narrative. The films also offer an alternative perspective to the cinematic responses to the Vietnam Syndrome. As the films look to Vietnam's future, they also look back in search of an authentic Vietnam that is attainable through the bodies of Vietnamese women.

The United States' identity crisis has worked on and through the bodies of Vietnamese women in the form of sex and death. The Vietnamese actresses in *Heaven and Earth* and *The Quiet American* were both plucked out of obscurity and had no prior acting experience. Their "innocence" and "authenticity" became strategies for selling the films to audiences, where Vietnam could be displayed as retaining elements of that nostalgic past. Their characters' sexuality is compromised, and the culprits are men of war from both sides. *Three Seasons*, the one film by a Vietnamese American filmmaker that is shot almost entirely in Vietnamese, further supports a neocolonial discourse by advocating a return to that past, as a Vietnamese prostitute forsakes her lifestyle influenced by Western materialism for a return to an idyllic childhood. Her sexuality is what is at stake in that forsaking. The return to a prewar era, when life was unspoiled by global capitalism and US corruption and vices, is hocked to the audience as part of the experience of Vietnam and Vietnamese people.

Ella Shohat and Robert Stam (1994) assert that Hollywood films about non-White life stories speak for marginalized communities and, thus, hinder attempts to represent themselves. Media discussion and the film narratives act in conjunction to produce and reiterate the trope of the Southeast Asian prostitute. The trope of the Southeast Asian prostitute serves this neocolonial discourse in identifying Vietnam as having been contaminated by political, economic, and military interventions, just as the Vietnamese prostitute in the films has been compromised by individuals who have been part of these same interventions. The Southeast Asian prostitute in the context of Vietnam allegorizes the positioning of Vietnam as feminine in need of care, guidance, and rescue, like the benevolent United States, a myth of discovery, during colonization. She/Vietnam cannot represent herself; she must be represented. Her story must always be told in relation to her lover, rapist, or client. Within the media discourse on the films, the filmmakers and Western male actors are privileged over the Vietnamese actresses. All three films suggest that the presence of the masculine is necessary for the Vietnamese woman in articulating her subjectivity.

In an examination of the media discourse on the films and the films' narratives, who speaks becomes more of a question of who is speaking for the actresses and their characters. The construction of their characters on screen as a return to an exotic past also was reflected offscreen in media discourse on the films. During the period of normalization of relations between Vietnam and the United States (and the lifting of the embargo), these films on Vietnam articulated meaning and desire that served a neocolonial stance. No longer does the United States seek to occupy other nations territorially, but, through the strategies of advanced globalization and flexible accumulation, the United States occupies Vietnam economically. The nostalgic return to Vietnam's past through the women's bodies is obscured when films and filmmakers reflect on the consequences of war without attention to the connotation of Orientalism in war, both on screen and offscreen, for Vietnamese women.

Chinese Cinema at the Millennium¹

Defining “China” and the Politics of Representation

Gina Marchetti

ABSTRACT

Chinese-language cinema has been undergoing dramatic changes since 2000. Many of these changes parallel economic, political, social, and other cultural developments that have radically transformed the Chinese-speaking world. As Chinese cinema develops out of this diverse population, transnational exchanges, diasporic alliances, and immigrant connections complicate any picture of a “national” or unitary Chinese cinema (Zhang, 2004). However, culture, language, ethnicity, and history link Chinese communities together, and the dynamics of a marketplace in which Chinese-language films circulate make the study of Chinese cinema a fecund research topic. From popular commercial features to esoteric exercises in film art for cultured elites, Chinese cinema continues to make a mark on world film screens. In addition to looking at the current scholarship on contemporary Chinese-language cinema, this essay explores the key themes, issues, and concerns found on Chinese screens at the millennium.

Chinese cinema has been undergoing dramatic changes since 2000. Many of these changes parallel economic, political, social, and other cultural developments that have radically transformed the Chinese-speaking world. Under Deng Xiaoping and his successors, the People’s Republic of China (PRC) has aggressively developed its economy, eviscerated its socialist “iron rice bowl” institutions, and seen a tremendous

gulf emerge between the rich and the poor, the countryside and the urban centers, with a shift in the population from the rural hinterlands to booming megalopolises. The suppression of the demonstrations in Tian'anmen Square in 1989 served only as a minor bump on the road to China's eventual membership in the World Trade Organization (WTO) and nearly complete integration into the global neoliberal economy. In 1997, Hong Kong, a British colony, returned to Chinese sovereignty and, since then, has been charting its own course as a Special Administrative Region (SAR) of the PRC. Since the end of martial law in the 1980s, Taiwan has struggled to assert itself on the world stage as more than a "renegade" province of mainland China. With the economies in the PRC, Hong Kong, and the Republic of China (ROC)/Taiwan going through cycles of boom and bust, Chinese-speaking people in other parts of the world – including the predominantly Chinese city-state of Singapore, the sizable populations of ethnic Chinese in Malaysia and other parts of Southeast Asia, as well as the "overseas" Chinese living in the Americas, Europe, Australia, and elsewhere – embrace or distance themselves from a global Chinese identity as they see fit.

As Chinese cinema develops out of this diverse population, transnational exchanges, diasporic alliances, and immigrant connections complicate any picture of a "national" or unitary Chinese cinema. However, culture, language, ethnicity, and history link Chinese communities together, and the dynamics of a marketplace in which Chinese films circulate make the study of Chinese cinema a fecund research topic. Within the context of the current scholarship on contemporary Chinese-language cinema, this chapter explores the key themes, issues, and concerns found on Chinese screens at the millennium. Covering some of the principal genres and narrative formulae frequently found in contemporary Chinese cinema, the analysis extends to representations of the nation, ethnicity, and the political processes that form the foundation of a contested and often fragmented "body politic."

Cataloguing all of the elements of Chinese genre films from 2000 to 2010 would demand more than a single volume – let alone a chapter. As a result, it seems more productive and, potentially, more useful analytically to look at those elements common to more than one genre. To this end, the focus here is on the common characters, plots, icons, themes, and issues that appear in genres such as martial arts, crime, comedy, horror, historical epic, documentary, and melodrama, among others. These films exist in a complex intertextual matrix that, of course, extends beyond the parameters of Chinese-speaking screen culture. These motion pictures compete with and speak to global concerns involving cinematic language and aesthetics, the international marketplace for film, and to popular genres that transcend ethnic Chinese cinema. In addition, these films take up issues that go beyond the borders of the Chinese-speaking world and involve economic, political, social, environmental, and other issues of global significance. In other words, these common elements provide insight into transnational Chinese cinema as well as indicating how Chinese-language motion pictures circulate within global film culture.

Exploring the content, then, of Chinese cinema opens up a window onto those changes that have occurred elsewhere that resonate beyond the borders of the PRC,

Taiwan, or Hong Kong. Changing labor relations, migration, growing class inequities, patterns of consumption, gender roles, sexual orientations, human–technology interfaces, cyber-societies, environmental degradation, post-9/11 anxieties, terrorism, surveillance, and the opportunities and stress involved with increased travel and instantaneous global communications all play a part in what can be seen on Chinese screens.

Representing the Chinese “Nation”

Within scholarship on Chinese cinema, debates continue to rage on the definition of the term. Since very different nation-states and other territories lay claim to being “Chinese” (e.g., PRC, ROC/Taiwan, Singapore, Hong Kong, Macau) and diasporic communities produce films in Chinese or about the ethnic Chinese experience outside of Chinese borders, scholars have turned to concepts such as “Chinese-language” (Berry & Farquhar, 2006; Lu & Yeh, 2005; Xu, 2007; Zhang, 2002) or “Sinophone” (Shi, 2007) cinema to use language as a basis for categorization. (For more on the transnational character of Chinese film, see Lo, 2005; Lu, 1997.) However, given that Chinese-language films can be broken down into various dialects (Mandarin, Cantonese, Hokkien, among others), using the dominant dialect of Mandarin as a marker of the “Chinese” character of the film can be problematic. Particularly in the past and in recent years, the linguistic hybridity of films made in Taiwan, Hong Kong, and the PRC has become more noticeable. Often a switch in dialect makes a plot point as a character speaks to others in a local dialect (subtitled in Chinese characters for the benefit of the audience). Even as Chinese films have globalized, the tendency to make distinctions through language has increased. Hokkien, for example, has resurfaced after the lifting of martial law in Taiwan. The use of this particular dialect divides the audience into those who have their roots in the pre-Kuomintang (KMT) Japanese colony and those who feel more comfortable communicating in Mandarin, the “official” *guo yu* (national language) of the KMT government-in-exile in Taiwan (Yeh & Davis, 2005). Many independent filmmakers in the People’s Republic also use dialects to mark their interest in the local or to contrast rural and/or provincial interests with life in the constantly evolving notion of a Chinese nation. Even as spectacles in Mandarin dominate the new multiplexes, so-called Sixth Generation, “urban,” “underground,” or independent filmmakers (Pickowicz & Zhang, 2006; Zhang, 2007) make films that use Beijing argot or local dialects to capture the feeling of being alienated from this project of fashioning a national identity on screen. In Hong Kong, of course, shifting use of languages has long been a factor as Mandarin and Cantonese productions were often punctuated by English or other Chinese dialects. Multiple soundtracks, dubbed dialogue, layers of subtitles, and alternative versions allow Chinese films to travel across these linguistic borders while maintaining a sense of a common ethnic identity.

The connections among language and national identity as well as local or community affiliations come to the foreground in many films. Ang Lee's *Crouching Tiger, Hidden Dragon* (2000), for example, has been a rather divisive film for Chinese viewers because of Lee's decision to work from a Chinese translation of an English-language adaptation of a Chinese *wu xia* martial arts novel and have all the actors speak Mandarin (rather than dub the nonnative Mandarin speakers such as Chow Yun-Fat and Michelle Yeoh). (For more on the production process for this film, see Sunshine, 2001.) Directed by Taiwan-born Lee, the film features ethnic Chinese actors from around the world, including the PRC, Taiwan, Hong Kong, and Malaysia. This highlights the melting-pot nature of Qing Dynasty imperial China (ruled at the time by the non-Han Manchu minority) and the polyglot hybridity of an emerging "global" China, or what Confucian scholar Tu Wei-Ming has called "cultural China" (Tu, 1994).

Borrowing liberally from the cinematic heritage of Beijing native King Hu, who established the new *wu xia pian* in Hong Kong in the 1960s, Lee, himself the child of mainland exiles, peoples the landscapes of mainland China (something King Hu never had the opportunity to do) with a younger generation from the PRC (Zhang Ziyi as Jen) and Taiwan (Chang Chen as her love interest in the wilderness), middle-aged characters played by Hong Kong stars (Chow Yun-Fat and Michelle Yeoh), and an older generation associated with King Hu and exiles from the mainland (Cheng Pei-Pei as Jade Fox). As the first transnational Chinese-language mega-hit of the new millennium, *Crouching Tiger, Hidden Dragon* continues an aesthetic tradition that predates the advent of the cinema in China. Like many other *wu xia* stories of heroes, bandits, stolen objects, warrior women, frontier wastelands, and a countryside outside the control of the central government, *Crouching Tiger, Hidden Dragon* uses its story to allegorize the Chinese nation with a woman – Jen, in this case – torn apart by the various contending forces trying to assert ideological hegemony. With a dramatic Western Chinese setting in the Gobi desert, the edges of the Qing Empire easily stand in for the contested borders of present-day China – from the nationalist movements in Taiwan and the democracy movements in Hong Kong to the calls for greater autonomy for Tibet and the Uighurs of Xinjiang. Jen, significantly played by a mainland actress (a fact driven home by her accent), romanced by old Shanghai (Cheng Pei-Pei), Taiwan (Chang Chen), and Hong Kong (Chow Yun-Fat), remains elusive as she jumps into the void at the end of the film – just as the PRC, from the perspective of Hong Kong, Taiwan, and the diaspora, maintains its mystery accompanied by a certain dread.

Although shunned in the PRC (as seen in a cool critical reception as well as box-office returns) (Chan, 2003; Kim, 2006; Klein, 2004; Martin, 2005; Wang & Yeh, 2005), *Crouching Tiger, Hidden Dragon* serves as the base for a series of call-and-response productions that reverberate in the first decade of the new century. The first clarion reply to Lee's feature came from another formidable auteur – Fifth Generation filmmaker Zhang Yimou. His film *Hero* (2002) provides a mirror image of *Crouching Tiger, Hidden Dragon*, with Lee's film set in China's last (Qing) and Zhang's in China's first

(Qin) dynasty. It features an all-star pan-Chinese cast with actors from the PRC (Jet Li, Zhang Ziyi), Hong Kong, and the diaspora (Tony Leung, Maggie Cheung, Donnie Yen). However, rather than ending with a leap of faith into an abyss, the film highlights the return of the eponymous hero (Jet Li), who remains nameless in the film, to the deadly embrace and unifying power of China's first emperor, Qin Shihuangdi (Chen Daoming).

Jet Li had made a name for himself as a transnational martial arts star, working in Hong Kong, Europe, and the United States, after getting his start as part of the PRC's prestigious *wu shu* team. Working through a narrative about rebellious factions trying to defy the Qin emperor's drive for Chinese unity, Jet Li's return to work in the mainland seems to add to the significance of his performance, gesturing toward national unity – conforming to this vision with the character's dying breath even after he purposely botches the assassination attempt (Chan, 2009). Told in a series of flashbacks that literally color the truth with different hues associated with various versions of the story, *Hero* complicates its depiction of nationalism and submission to a central figure of authority that can consecrate China as “our land.”

Subsequent films have continued this allegorical back and forth between visions of the Chinese nation as a unified whole (often, as in the case of *Hero*, bloodily achieved) and invocations of “China” as more diffuse and diverse, spilling over the edges of any definable nation-state, and characterized by a diasporic, flexible identity with the Chinese wanderer as a citizen of the world. These narratives take place in dynastic China at pivotal points in history when diverse peoples came together to acknowledge their fealty to the Chinese empire or at points when these same people rebelled against the emperor's heavenly mandate to rule imperial China. All of these films play with a similar dialectic. China acts as a modern (“Western”) nation-state based on what Anderson might call an “imagined community” (Anderson, 1983). However, this image of the modern state vies with an older vision of China as an empire made up of tribute nations, non-Han minorities, and hybrid populations linked to trade along ancient routes, for example, the Silk Road (*Warriors of Heaven and Earth*, 2003; *The Treasure Hunter*, 2009) or the Tea-Horse Road between Yunnan and Tibet (Tian Zhuangzhuang's documentary *Delamu*, 2004). The edges of the empire provide the setting for many of these films, with Western China from the Gobi Desert to the grasslands of Mongolia as particular favorites; for example, *Mulan* (2009) or Tian Zhuangzhuang's *Warrior and the Wolf* (2009).² Even films by independent filmmakers from the Sixth Generation feature references to the Western deserts and grasslands as a nod to the importance of the border and the limits of the national. For example, several of Jia Zhangke's films including *The World* (2004) and Zhu Wen's East–West meditation *Thomas Mao* (2010), among others, are set in or near Mongolia or enlist Mongolia as a central trope within the film.

The Russian (Jiang Wen's *The Sun also Rises*, 2007) and Korean (Zhang Lu's *Dooman River*, 2010) borders also pop up periodically, and characters from Japan and the Middle East pass through. Although it may be tempting to say that films directed by filmmakers from Hong Kong, Taiwan, or the diaspora would highlight the idea of

“China” as a cosmopolitan, pre- or post-national entity, unified by a written language and shared history rather than by the “mandate” of any particular government or notion of “citizenship,” this is really not the case. As the example of *Hero* shows, stories about the founding moments of the Chinese nation tend to contain contradictions, and, as various depictions of Emperor Qin show (contrast Chen Kaige’s *The Emperor and the Assassin*, 1999, with his classmate/former collaborator/fellow Fifth Generation rival Zhang’s *Hero* and the Jackie Chan vehicle, *The Myth*, 2005), specific historical figures may be sympathetic and justified at one point and depicted as villains the next.

Looking at films set in feudal China (*The Warlords*, 2007; *Red Cliff*, I and II, 2008–2009; *Confucius*, 2010) and films about the founding moments of the Republic of China (*Bodyguards and Assassins*, 2009) and the People’s Republic of China (*The Founding of a Republic*, 2009) may help to clarify this point. All the films deal with challenges to the Chinese nation as a unified state, questions of the legitimacy of rule, and narratives that allegorize the construction of the nation by references to actual historical figures and incidents as well as mythic reconstructions of legendary figures and their exploits. The two sets of films are directly in conversation with each other. *The Warlords* self-consciously references the same material on which *Red Cliff* is based (*The Romance of the Three Kingdoms*), and *Bodyguards and Assassins* shares much of the same production team and star power with its counterpart, *The Founding of a Republic*. While *The Warlords* and *Red Cliff* highlight the tendency of China to be torn apart by uprisings, rebellions, and challenges to its imperial ambitions, *Bodyguards and Assassins* and *The Founding of a Republic* point toward the constitution of China as a modern nation-state under the leadership of Sun Yat-sen and Mao Zedong respectively as “founding fathers.” However, as these films circulate in the same markets with quite a lot of shared talent and resources (e.g., Peter Chan directed *The Warlords* and produced *Bodyguards and Assassins*), the ideological differences may be smoothed over by common narrative strategies, star performers, locations, stunts, and computer-generated imagery (CGI). Nationalist fervor or anti-nationalist resistance become less a conscious declaration of a specific auteur and more a manifestation of the range of ideological positions available within the hybrid genre of the historical epic/*wu xia pian*.

The Warlords is based on legends surrounding an actual assassination during the Taiping Rebellion (1851–1864) against Qing rule. Like *Crouching Tiger, Hidden Dragon*, *The Warlords* references another film from Hong Kong’s golden age made by Chang Cheh, who, like King Hu, was an exile from mainland China. Chang Cheh’s film *Blood Brothers* (1973) takes up the story of three comrades-in-arms who find themselves on the side of the Qing forces but whose sympathies change during the course of the story – helped along by an adulterous love triangle. Again, casting may take on allegorical significance, since the two blood brothers, who turn away from the violence of the state, are played by Hong Kong actor Andy Lau and Taiwanese/Japanese actor Takeshi Kaneshiro, while the Qing general is played by PRC-born Jet Li. In this case, Jet Li sacrifices his sworn brother in order to bring peace to war-torn

Figure 15.1 An opera presentation of *The Three Kingdoms* in *The Warlords* (2007), produced by Media Asia Films; Morgan & Chan Films; China Film Group.

China. Seeing the general as a traitor to his sworn brother (by having an affair with his wife) as well as to the common people, the third brother Jiang (Takeshi Kaneshiro) knifes the general while Qing sharpshooters simultaneously shoot him in the back. Jet Li, then, takes it from both sides, dying at the hands of his bandit comrade as well as of his imperial masters.

As China settles into a relationship with Hong Kong based on a “one country, two systems” model developed for the repatriation of Taiwan, films about people facing a decision involving their loyalty to one side or another in a particular historical conflict increasingly find their way to Chinese screens. In *The Warlords*, for example, the allusion to *The Romance of the Three Kingdoms* underscores the traditional importance of personal loyalty and “brotherhood” at moments when conflicting forces tear at China. The Ming Dynasty novel revolves around upholding the oath of brotherhood among three sworn brothers at a time when those bonds are tested by changing political loyalties at the end of the Han Dynasty. When the three blood brothers in *The Warlords* are doubled in the Peking Opera interlude in Chan’s film, their face makeup resembles the makeup usually used for the Peach Orchard sworn brotherhood of Liu Bei, Kwan Yu (Guan Gong), and Zhang Fei of *Three Kingdoms* fame. The crosscutting in that scene highlights the mythic nature of the story and juxtaposes it with the “brotherhood” of the three protagonists in *The Warlords* as founded, by contrast, on the superficiality of popular entertainment, publicity generated by the general’s exploits, and theatrical displays. Genuine brotherhood is dead, if it existed at all, and only the shallow performance of these fundamental ties remains.

Several other films take up characters and incidents from Lo Kuan-chung’s *The Romance of the Three Kingdoms* (including *Three Kingdoms: Resurrection of the Dragon*, 2008, and *The Lost Bladesman*, 2011), which begins with the line generally translated as “The Empire, long divided, must unite: long united, must divide.” (For more on the novel, see Wu, 2003.) This line eloquently addresses the anxieties surrounding

the “rise of China” as a global economic force, a new or renewed imperial presence, as well as the calls for greater autonomy from places such as Taiwan, Xinjiang, and Tibet. Given this, John Woo’s choice to return to Hong Kong/PRC filmmaking with *Red Cliff* (Parts I and II), based on a famous river battle from the period, makes considerable sense. Woo established his career within the Hong Kong triad genre, making classic films about brotherhood such as *A Better Tomorrow* (1986) and *The Killer* (1989). These hits spoke to the audiences between the signing of the Joint Accord, which set the timetable for Hong Kong’s change in sovereignty, to the repercussions of the June 4 crackdown in Tian’anmen on the British colony. Woo moved to Hollywood around the time of the Handover (1997). With *Red Cliff*, Woo returns to Asia to take up an adaptation of perhaps the best-known Chinese story about brotherhood and the nation, reworking it to focus on the friendship between two men who are depicted as rivals in the novel, Zhou Yu (Tony Leung) and Zhuge Liang (Takeshi Kaneshiro). Again, the casting may be significant, with Hong Kong and Taiwan stars facing off against a mainland actor who takes on the role of the arch-villain Cao Cao (Zhang Fengyi), obscuring what this classic tale, which is also a hugely popular videogame, actually says about China as a world power or coherent nation-state. The spectacle of military formations, featuring geometric designs, also complicates the picture quite literally by appealing to what Siegfried Kracauer (1995) has termed the aesthetics of the “mass ornament,” in which individual volition merges into the repetitious patterns of mass society (as seen, for example, in Zhang Yimou’s staging of the opening ceremony at the 2008 Olympics in Beijing). (For a look at how *Red Cliff* has been received within the Chinese diaspora, see Cheung, 2010.)

As another case in point, Hu Mei’s *Confucius* (2010) ostensibly pays tribute to the venerable ancient sage who has become, for some, a token of China’s reinvention of itself as a mercantile society based on traditional values. Given that Confucius had been denounced as a feudal holdover opposed to women’s equality just a few years before, female director Hu Mei’s reinvention of the figure by casting Chow Yun-Fat as the scholar-politician-deity merits some consideration. Chow may be best known for his triad-brotherhood films with John Woo (such as *A Better Tomorrow* and *The Killer*) as well as forays into history in films such as *Crouching Tiger, Hidden Dragon* and comedies such as *Once a Thief* and *God of Gamblers*. Hailing from Hong Kong and associated more with the action of the *jiang hu* than with the veneration of a Confucian temple, Chow appears to undercut the gravity to which a tribute to Confucius would likely aspire. Although the sage does get to engage in a bit more military action than he did historically, Confucius tends to look foolish on many occasions. At one point, even his horse seems to laugh at him when the master falls in the mud while trying to make a hasty escape after being excluded from a ritual. Nan-zi (Zhou Xun, a mainland actress known for her beauty as well as acting ability), who plays the female villain in historical accounts, seems to get the best of Confucius, who ends up acting like an awkward teenage boy in her presence. Fifth Generation director Hu Mei, in fact, may not be alone among women of her cohort who linked feudalism, Confucianism, sexism, and anti-Mao/anti-revolutionary sentiments together. Resurrecting Confucius through a

Hong Kong actor known for his gangster/action/romantic comedy roles may be one way of keeping that contradiction between Confucius as business advisor and Confucius as feudal counterrevolutionary alive.

This same tension appears to exist in other films that deal with Chinese history. During the Cold War, historical films were sharply divided ideologically with figures like Confucius, for example, and his teachings venerated in Hong Kong and Taiwan and denounced in the PRC. However, these earlier divisions erode as co-productions within the Chinese-speaking regional industry become commonplace. The ideological swirl of films such as *Bodyguards and Assassins* (pointing toward the commemoration of the centenary of Sun Yat-sen's triumph over the Qing, 1911–2011) and *The Founding of a Republic* (made to celebrate the sixtieth anniversary of the establishment of the People's Republic, 1949–2009) that results can be dizzying. While Emperor Qin and General Ma may be ambivalent subjects of assassin attempts, any threat to Sun Yat-sen would be taken as an assault on one of the few unifying figures in modern Chinese history. As the mastermind behind the movement that led to the downfall of Manchu rule and the founder of the Republic of China, Sun Yat-sen is venerated by the Nationalists (KMT) in Taiwan as well as the Communists (CCP) in the PRC. After his death, his wife, Song Qingling, went on to be a key supporter of Mao and the 1949 Revolution, while her sister, Song Meiling, became Chiang Kai-shek's wife and first lady of the ROC government-in-exile on Taiwan (finally dying in 2003 in New York City where she had taken up residence).

Bodyguards and Assassins and *The Founding of a Republic*, made by many of the same co-producers (including Fifth Generation filmmaker Huang Jianxin) and showcasing a common pool of on-screen star power, use a similar formula to update the turgid genre of the “propaganda” film or patriotic epic. While *Bodyguards and Assassins* involves pure fiction with a dash of history and *The Founding of a Republic* tries to put in as many “true” facts and details as possible, both films allow the pan-Chinese audience to see “their” history on screen as well as spot dozens of the region's most popular stars in either leading or cameo roles. While *Bodyguards and Assassins* can rely on Sun Yat-sen as a dependable unifying figure, Mao gets sidelined in *The Founding of a Republic* with figures such as Chiang Kai-shek's son, Chiang Ching-Kuo (played by dashing mainland actor Chen Kun), taking up more screen time than might be expected. This may acknowledge Taiwan's reinstatement of the KMT with the election of Ma Ying-jeou in 2008 and improved relations with the PRC – after the years of “separatist” tensions coming from the presidency of the Democratic Progressive Party's Chen Shui-bian.

Coming full circle with his reconsiderations of the Chinese nation, Ang Lee's *Lust, Caution* (2007) restates many of the same concerns found in *Crouching Tiger, Hidden Dragon*. Although as a sexually explicit spy thriller it seems to be galaxies away from the *wu xia pian*, both films have quite a lot in common, specifically a focus on a central female protagonist as an ideological battleground for conflicting personal and political sentiments. Although James Schamus calls *Lust, Caution* “the Chinese porn movie” (Sperling, 2008), he followed the same procedure for both films, which he co-wrote,

by working with English translations of the original materials, scripting them in English, and then working with translators/co-writers to put them back into Chinese. The similarities in the films' characterizations of women contending with their own desires within the oppressive context of feudal or fascist attitudes toward women speak to preoccupations that include and transcend patriotic feelings and specifically Chinese concerns. (For more on *Lust, Caution*, see Chang, Schamus, & Wang, 2007; Chi, 2009; L. Lee, 2008.)

Like Lou Ye's *Purple Butterfly* (2003) and Chen Kuo-fu and Gao Qunshu's *The Message* (2009), *Lust, Caution* deals with spies in Japanese-occupied China. Chia-chih (played by Tang Wei, a relative newcomer from the PRC) becomes embroiled in an assassination plot (as another iteration of the political assassination theme) against Mr. Yee (Tony Leung), a higher up in the quisling Wang Jingwei's regime, which collaborated with the Japanese invaders in Shanghai during the Occupation (World War II). To execute the plan, Chia-chih becomes Yee's mistress; however, at the fatal moment, she chooses to put aside her patriotic sentiments and her loyalty to the resistance in order to save her lover's life. The film builds to this climactic moment, which takes place in a jewelry store. Yee has decided to solidify his bond with Chia-chih by purchasing a ring for her. Chia-chih uses the assignation in the jewelry store as a setup for Yee's assassination, but she allows him to escape instead.

No voice-over narration, no intertitles, no dialogue spoken by other characters allows us into either Yee's or Chia-chih's head at that critical moment in the jewelry store. Lee keeps the film on the level of speculation – she loves him, she thinks he loves her, she has lost “faith” in the validity of her cause (maybe she simply can no longer see the Japanese as all that bad or the Nationalists as all that good). Ultimately, then, the film remains mute, and the political implications of Chia-chih's action obscure. Lee's use of explicit sex and mixed sentiments about the Chinese nation, putting glamorous Hong Kong star Tony Leung as a murderous traitor in bed with a young Chinese actress, eliciting rumors about whether they actually “did it” during shooting, did not play well in the mainland. Cinematic choices, then, involving casting and nudity may make more of a statement about the differences within the Chinese-speaking world than any direct statement about democratic rights, sovereignty, or local autonomy could.

The Global Economy and the Rule of Law

Intertwined with questions of China as a “nation,” “empire,” and global presence, the gargantuan changes in China's political economy preoccupy many filmmakers. China's embrace of capitalism, consumerism, and what Debord has called the “society of the spectacle” (1994) finds its expression on screen in often caustic treatments of publicity, advertising, marketing, and tourism. In several films, the neoliberal “new” economy is satirized as a transnational scam. Hong Kong comic Stephen

Chow's *Shaolin Soccer* (2001) lampoons the dog-eat-dog competitiveness of Chinese society, for example, by displacing it onto the exploits of an amateur soccer team hoping to find some spiritual redemption and brotherhood through kung fu. The purity of their intentions aside, the losers know they have "made it" not from the level of their skill but by the appearance of their captain and his girlfriend's faces on a giant billboard as the "Kung Fu Couple" at the film's end (of course, alluding to the concluding image of the Hollywood musical *Singin' in the Rain*, 1952).

In a similar vein from across the border, Feng Xiaogang's *Big Shot's Funeral* (2001) features a Chinese cameraman, Yo Yo (Ge You), employed by a declining film director, Don Tyler (Donald Sutherland), who falls into a coma when faced with the financial failure of his current project being shot on location in the PRC. Yo Yo, a natural publicist and budding entrepreneur, sells advertising space and time as part of the fake funeral for the Western celebrity auteur, but Tyler's recovery, of course, complicates the spectacle of his death. (See Braester, 2005; Wang, 2003; Zhang, 2008.) Jia Zhangke's *The World* (2004) uses a theme park (shot on location in Beijing and Shenzhen) as a metaphor for China's entry into the global economy. Behind the exotic spectacle of India, Japan, the United States, and Europe, the tourist site becomes the meeting ground for human traffickers, designer label counterfeiters, sex workers, petty thieves, and other miscreants from across China as well as across the Russian border. In both films, the global economy, the "open market," and the "free" flow of people and images add up to corruption, exploitation, and deceit. (For more on the film, see Lu, 2008; McGrath, 2007; Silbergeld, 2009; Zhang, 2009.)

The triad film perhaps best exemplifies this treatment of the global economy out of control. Andrew Lau and Alan Mak's *Infernal Affairs* trilogy (2002–2003) (Marchetti, 2007), remade by Martin Scorsese as *The Departed* (2006) (Marchetti, 2010), unravels the knot that binds cop and crook within the underground economy of sex, drugs, and contraband munitions. The trilogy highlights the uncertain power of state/police authority in an era of changing political loyalties (Hong Kong's transformation from a British colony to a "Special Administrative Region" of the PRC) and globalized economics. The narrative interweaves the crisscrossed lives of two moles (one a triad masquerading as a cop, the other an undercover operative in the gangs) as a metaphor for the schizophrenic identities these mercurial economic positions and shifting political loyalties foster. Although they operate on opposite sides of the law, something disturbingly similar about these two moles makes them interchangeable in several significant ways.

Played by two of the biggest stars in Hong Kong, Andy Lau and Tony Leung, the pair meet only briefly at various points in the story. At the beginning and end of the narrative, the two encounter each other in a shop selling classic audio equipment. The two strangers immediately bond (forgetting that they had met before in the police academy) as salesman and customer in the quintessentially Hong Kong act of shopping. Both part of the consumer/service economy, they listen to a Mandarin singer from Taiwan and finish the sales transaction with a credit card, the global symbol of

Figure 15.2 Tony Leung and Andy Lau in *Infernal Affairs* (2002), produced by Media Asia Films; Basic Pictures.

middle-class financial power. The fake cop/real customer does not suspect the real undercover/fake merchant of hiding drugs inside one of the speakers, and both play their roles as consumer and merchant with more sincerity than either manages to muster as either cops or crooks. However, the deal-making that takes place in the legitimate economy parallels the corruption of the police force as well as of the underworld. The traditional values of loyalty and brotherhood found in the Confucian classics as well as in epics like *The Romance of the Three Kingdoms* no longer operate, and the global marketplace has challenged the authority of older institutions.

Uncertain identity and unclear loyalties become central to films similar to *Infernal Affairs* that focus on their protagonists' paranoid delusions and schizophrenic tendencies. These include *Confession of Pain* (2006), *Mad Detective* (2007), *To Live and Die in Mongkok* (2009), *Accident* (2009), and *Overheard* (2009), which, like *Eye in the Sky* (2007), highlight surveillance as a major theme. The Jackie Chan–Daniel Wu vehicle *Shinjuku Incident* (2009) exports the madness to Japan with a story about mainland migrant workers on the wrong side of the local yakuza and transplanted Taiwanese triads. Hou Hsiao-Hsien's *Millennium Mambo* (2001) also deals with a woman drifting on the edges of Taiwan's triad societies and against the landscape of Japan. However, unlike Jackie Chan's love interest in *Shinjuku Incident*, Vicky (Shu Qi) moves between men accompanied by her voice-over meditation on her youth, which takes the film far outside the usual parameters of the triad genre.

Featuring the spectacular and violent encounter of the state with the criminal, the triad film has taken up many of the anxieties associated with changing understandings of the "rule of law" in the Chinese-speaking world. As producer and director, Milkyway's Johnnie To has developed this theme as part of his auteur signature. Whether looking at police units or criminal gangs, To falls back on generic themes of brotherhood and bloodshed in order to explore the anxieties associated with the

vicissitudes of global capitalism (including the economic downturns in 1997, 2003, and the post-2008 economic “tsunami”) in relation to the legal system. In films such as *PTU* (2003) (Ingham, 2009; V. Lee, 2008; Teo, 2007) and *Election* (2005), the plot revolves around the possession of a coveted object (a gun, a ruling scepter) that signals the vulnerability of authority and its putative legitimacy to loss or theft.

Although the English title of *Election* refers to a vote for a new triad chief rather than the chief executive of the HKSAR (the film’s Chinese title simply refers to the “black society” of the triads), the allegorical possibilities of the cross-border jockeying for power that forms part of the plot for To’s film cannot be ignored. Documentary filmmaker Tammy Cheung, in fact, does not hesitate to use the same English title for her film *Election* (2008), a cinéma vérité treatment of Hong Kong’s electoral process. Both To and Cheung put their fingers on the issue of “democracy,” access to government decisions, and the transparency of the legal system as key to an understanding of the legitimacy of any political form, and many other films throughout the Chinese-speaking world deal with the same issue. In the People’s Republic of China, documentary films such as Zhao Liang’s *Crime and Punishment* (2007) and *Petition* (2009) take an acerbic look at the law, and hybrid fictions such as Ying Liang’s *The Other Half* (2006), set in a Chinese law firm, also deal with the PRC legal system.

Several fiction and nonfiction films from the PRC, in fact, bring together a constellation of issues involving environmental degradation, the corrupting forces of global capitalism, and the political excesses of the nation-state. Li Yang’s fictional *Blind Shaft* (2003), for example, deals with murderers who prey on migrant workers involved in illegal mining operations. Other films chronicle the impact of the Three Gorges project on the lives of those displaced by the dam, including documentaries such as Li Yifan and Yan Yu’s *Before the Flood* (2005) and Jia Zhangke’s fiction/documentary diptych *Still Life* (2006) and *Dong* (2006). Wang Bing’s epic documentary *West of the Tracks* (2003), with a running time of 554 minutes, chronicles the slow decay of factory life in the “rust belt” of China’s northeast, and Hong Kong filmmaker Ann Hui sets part of her fiction feature *The Postmodern Life of My Aunt* (2006) amidst the same provincial industrial wasteland. (See Marchetti, 2009; Szeto, 2011.)

Jia Zhangke’s hybrid documentary/fictional reenactment *24 City* (2008) also depicts the transformation of China’s heavy industry, but in a different part of the nation – the city of Chengdu in Sichuan. Because of its proximity to the epicenter of the 2008 earthquake, Chengdu has occupied the minds – and the screens – of many since the disaster. Du Haibin’s documentary *1428* (2009) takes its title from the precise time the earthquake struck at 2:28 p.m., and Feng Xiaogang’s blockbuster *Aftershock* (2010) mixes the family melodrama with the disaster epic as its story journeys from the 1976 Tangshan earthquake to the Sichuan quake of 2008. In the case of *Aftershock*, the natural disaster depicted on screen may not appear to be so “natural” when the story of a mother who chooses to have her son rescued at the expense of her daughter in 1976 likely conjures up images of collapsed school buildings and photographs of the student victims in Sichuan in 2008.

The Aftershock of History

As films such as *Aftershock*, *24 City*, *The Postmodern Life of My Aunt*, and *Lust, Caution* demonstrate, the writing and rewriting of recent Chinese history preoccupies filmmakers as much as the dynastic past. Filmmakers return to key traumatic moments time and again, for example, the Japanese Occupation, the Cultural Revolution, the White Terror in Taiwan, the 1967 riots in Hong Kong, the June 4, 1989, crackdown in Tian'anmen. The 1937 Rape of Nanjing, for example, has often been brought to Chinese (as well as Western) screens, and it continues to elicit controversy. Lu Chuan's *City of Life and Death* (aka *Nanjing! Nanjing!*, 2009) challenges Chinese understandings of the massacre by including a humanized portrait of Kadokawa (Hideo Nakaizumi), a Japanese soldier who also decries the slaughter and commits suicide rather than be part of the violence. Li Ying's documentary *Yasukuni* (2007) takes a more indirect approach by focusing on the controversies surrounding the Shinto shrine in Tokyo that honors Japan's war dead, including war criminals involved in the Rape of Nanjing and Taiwanese soldiers conscripted to fight against other ethnic Chinese during the Pacific War.

While known for casting Japanese karateka as villains, Chinese martial arts films, perhaps acknowledging the continuing importance of the Japanese audience, often feature Japanese warriors in sympathetic roles. In the Jet Li vehicle *Fearless* (2006), loosely based on the historical figure Huo Yuanjia and set before World War II, Tanaka (Shido Nakamura) sits down for a civilized cup of tea to bond with opponent Huo. The Donnie Yen film *Ip Man* (2008), also based on the life of an actual martial artist (Bruce Lee's Wing Chun master), set during the Occupation, portrays the Japanese martial artist Miura (Hiroyuki Ikeuchi) as more sinister. Wei Te-Sheng's *Cape No.7* (2008) takes a very different approach to the Japanese colonization of Taiwan by imagining the end of the war as a series of love letters between a teacher, repatriated to Japan, and his local Taiwanese student, providing a nostalgic backdrop for a story about contemporary life on the island. Hou Hsiao-Hsien's *Café Lumière* (2003) wittily imagines the sexual flow between Japan and its former colony going in the opposite direction as a Japanese woman returns home pregnant after a sojourn in Taiwan working on a biography of composer Jiang Wen-Ye, born in colonial Taiwan and educated in Tokyo, who worked in Japanese-occupied Beijing and stayed after 1949 until his death in 1983. Like *Lust, Caution*, *Café Lumière* dares to question the line between personal and political loyalties – individual desire and nationalist sentiments. Hou takes up the challenge of making a Taiwanese film in Japanese – as a reversal of the Japanese propaganda films made in Manchukuo in Chinese during the Occupation that play in the movie theaters depicted in *Lust, Caution*.³

Johnnie To and Wai Ka-Fai's *Running on Karma* (2003) examines the atrocities of the war from a spiritual distance, making unexpected karmic connections between the present and the past in a story about a Hong Kong lady cop and a former monk turned exotic dancer from mainland China. Working in the PRC, actor-director-writer

Jiang Wen's *Devils on the Doorstep* (2000) uses satire to confront the legacy of the war in a story about two hapless Japanese prisoners detained by Chinese villagers; the controversy surrounding the sympathetic portrayal of the bond between the Japanese POWs and the peasants caused the film to be banned and Jiang barred from directing for several years. (See Martinsen, 2005.)

After the ban, Jiang moved from the Japanese Occupation to the Great Leap Forward (1959) and the end of the Cultural Revolution (1976) with *The Sun also Rises*, a magic-realist sweep across China to the Gobi Desert and the Soviet border. Historical tensions and political realities become a whirl of images and sensations, bedroom farce, and slapstick comedy. In fact, PRC films made after 2000 tend to move away from depicting the violent excesses of periods such as the Cultural Revolution to focus on the continuing impact of political movements on individuals and their families. Wang Xiaoshuai's *Shanghai Dreams* (2005) features a family torn apart by the drive to return to Shanghai from Guiyang after the Cultural Revolution. Zhang Tianhui's documentary *Farewell, Beijing* (2010) follows Gong Fenghai, a "sent-down youth" from the Cultural Revolution, as he tries to find a way to return to Beijing and retire closer to his family (much to their chagrin). Hong Kong director Ann Hui's *The Postmodern Life of My Aunt* focuses on a woman who had been sent away from Shanghai during the Cultural Revolution and had made the choice to abandon her working-class husband and their daughter in order to make a life for herself back in the metropolis.

In *Everlasting Regret* (2005), Hong Kong director Stanley Kwan uses the life of his female protagonist Qiyao (Sammi Cheng) to trace the political vicissitudes of life in Shanghai from the 1930s through the end of the Cultural Revolution and into Deng's Reform Era. Even a film such as Ning Ying's *Perpetual Motion* (2005), an all-female look at approaching middle age in Beijing, contrasts the shiny Mao buttons and Cultural Revolution LPs stored away in the attic of the privileged courtyard home in which the film is set with the trauma of families destroyed by the political climate of that era.

In a parallel fashion, Hong Kong cinema returns to the trauma of British colonialism and the Cold War era, while Taiwanese films look back in horror at the KMT's "White Terror" purges. Wong Kar-wai, of course, masters the depiction of the pain and desire characteristic of Hong Kong's postwar period in his films *In the Mood for Love* (2000) and its sequel of sorts, *2046* (2004). Dealing with characters displaced temporally (historically) and spatially (geographically) in the wake of World War II, the 1949 Chinese Revolution, and the rise of US influence and the Japanese economy, the films use adulterous couples, cuckolded husbands, bored housewives, and frustrated lovers to explore the ways in which that era parallels our own. Using a roving camera, a soundtrack sampling world music, and a stylishness exemplified by the tailored *qi pao/cheung sam* the women wear, Wong creates a cinematic world full of broken dreams, exiles' fantasies, displaced people, and misplaced romantic desires.

In fact, the *qi pao* stand as emblems of this trauma of displacement. Beautifully tailored, using patterns that mark the passage of time and the seasons, as well as

marking the line between the elegance of high fashion and the drab, cramped surroundings in which the refugees find themselves after fleeing Mao's China for crowded Hong Kong across the border, the distinctive Chinese dress does more than mark the women as desirable sex objects sown into silky gowns that cling to their bodies. The *qi pao* define the exiles as part of an affluent, displaced class from Shanghai, known as the center of Chinese fashion before 1949, pointing to the only way they can continue to display their wealth and privilege in their new environment.

As an outsider who does not come from Shanghai, Chow Mo-wan (Tony Leung) has difficulty even seeing his wife's affair with the husband of the glamorous Su Li-zhen (Maggie Cheung), who lives next door. While he plays the cuckolded husband and repressed lover in *In the Mood for Love*, Chow Mo-wan undergoes a complete change of character in *2046*, perhaps alluding to the ways in which the times demand radical changes in even the deepest parts of the psyche. The changes in clothing, mood, and morals seem to parallel the vicissitudes of the time, and Yonfan's *Prince of Tears* (2009) takes up similar themes against the backdrop of the KMT's "White Terror" in Taiwan. As in Wong's films, Yonfan's narrative looks at the Cold War through women's fashions and romantic entanglements, while adding a layer of political intrigue as the KMT tries to ferret out and execute so-called communist spies.

Samson Chiu's *Mr. Cinema* (2007) and Alex Law's *Echoes of the Rainbow* (2010) explore life in Hong Kong at its poorer margins during the Cold War period. Living on the edges of the colonial city as squatters, the characters in these films lead a precarious existence. In *Echoes of the Rainbow*, for example, the tailors, shoemakers, and small businessmen who eke out a living as squatters in Hong Kong must contend with corruption at every point. The British cop on the beat demands bribes to permit them to stay in business. In order to get basic care in the hospital, nurses and technicians for blood transfusions must have an inducement that literally becomes "blood" money when the young patient dies. The hospital in the mainland to which the family turns in desperation to help their son offers no solace, since it has been incapacitated by the Cultural Revolution. While US dreams of space flight and the promise of advancement through an English education offer some hope to the younger generation in the film, the passing away of the young leukemia victim lessens the impact of the film's nostalgic evocation of the past.

Mr. Cinema looks at the same era through the eyes of a leftwing film projectionist, who also struggles to maintain himself and his family in colonial Hong Kong. The protagonist Zhou ("Jow" in Cantonese is a homophone for "left" so the character, played by Anthony Wong, is also known as "Leftie") acts, however, as a somewhat naïve idealist rather than a radical communist ideologue. He neglects his family to attend political meetings and rallies in addition to spending hours screening films from the PRC. Although his environment may speak to his political sentiments, the fact that his banter with his KMT neighbor eclipses any leftist political organizing he actually accomplishes points to *Mr. Cinema*'s failure to take the left seriously. In fact,

one of the more droll scenes in the film involves Zhou realizing that both he and his KMT neighbor agree that the disputed Diaoyu Islands belong to “China” (whether PRC or ROC) and definitely not Japan. In *Prince of Tears*, communist sentiments become the stuff of high drama and tragic consequences, whereas, *Mr. Cinema* treats the left as comedy and its impact on the family as melodrama.

Although Zhou dreams of going to Tian’anmen, the film does little to examine the roots of the anticolonial feelings that may be fueling that wish. *Echoes of the Rainbow*, in fact, appears to address the reasons for the 1967 riots better, even though the film is conveniently set two years after the fact in 1969. While *Echoes of the Rainbow* may avoid the riots, it does not shy away from British colonial excesses and the creeping cultural and military presence of the United States in Hong Kong. *Mr. Cinema* breezes past the 1967 riots on its own way to the 1997 Handover, while avoiding that other milestone that shook Hong Kong – the demonstrations in support of the May–June 1989 protests in Tian’anmen. The centrality of Tian’anmen in Zhou’s imagination and as a visual icon in the film only serves to underscore that absence in order to make a tacit ideological point.

In fact, the trauma of Tian’anmen has seldom found its way to Chinese screens in any substantive way. Emily Tang’s Hong Kong-produced *Conjugation* (2001) does take up the lives of recent graduates trying to get by in Beijing immediately after the crackdown, and Lou Ye’s *Summer Palace* (2006) explores the sexual meanderings of a group of university students before, during, and after the demonstrations. Stanley Kwan’s queer romance *Lan Yu* (2001) includes a scene featuring the June 4 crackdown, but the connection between the political demonstrations and any call for lesbian, gay, bisexual or transgender (LGBT) rights in China remains obscure. *Mr. Cinema*, then, may say more by the conspicuous absence of the 1989 demonstrations in either Tian’anmen or Hong Kong by leaving it as a void in Chinese history.

Conclusion

As “China” continues to be a contested concept on transnational screens in the first decade of the millennium, filmmakers return to the same themes – defining the nation, borders/border crossings, political divisions and controversies, the marketplace, law, and history. As Hong Kong redefines its new position as an SAR, Taiwan continues to struggle with its status, Tibet and Xinjiang agitate for greater autonomy, and the ethnic Chinese living elsewhere negotiate their identities within various nation-states, Chinese-language cinema plays a role in imagining these identities and alliances. Of course, these crises of national legitimacy, economic clout, and personal identity go beyond the specifics of Chinese film culture. In *Cinema 2: The Time-Image*, for example, Gilles Deleuze notes that while in the past filmmakers could address moviegoers en masse, this no longer remains true. He states: “the people no longer exist, or not yet . . . the people are missing” (1989, p. 216). This seems to be a fair characterization of contemporary Chinese cinema. The Cold War politics and

national alliances of the past no longer operate, and this has consequences for the cinema that extend beyond the case of Chinese film. Again, as Deleuze observes:

The death-knell for becoming conscious was precisely the consciousness that there were no people, but always several peoples, an infinity of peoples, who remained to be united, or should not be united, in order for the problem to change [...] the people exist only in the condition of minority, which is why they are missing. (1989, p. 220)

As stories about the disintegration of Chinese dynasties such as the classic *The Romance of the Three Kingdoms* vie with popular histories of founding moments of the modern Chinese nation-state, this tendency to see the Chinese people as “missing,” fragmented, and/or in the process of being united or not resonates with trends in global film culture.

Many related issues of family structure, women’s roles, sexual orientation, migration, class divisions, and labor appear in other Chinese-language films during this period as well, all pointing to a crisis of defining the Chinese “people” as their identities multiply and mutate. Ranging across ideological positions, geopolitical considerations, and very different conceptions of what it means to be “Chinese” in the world today, contemporary cinema allows for debates about identity to occur and various possibilities to be visualized. However, Chinese screens also close off other avenues for consideration, cordoning off areas of the imagination, placing them “off limits.” Many films, therefore, appear to say more through what filmmakers have chosen to leave offscreen than what, in fact, appears in the cinema. Some positions receive considerable attention at the summit of blockbuster epics, while other perspectives remain in shadow in the valleys of independent production. The contemporary visual landscape contains the contradictions and concerns that form a vision of “China” in the last 10 years, and this brief overview prompts further consideration of why filmmakers define, visualize, and present the issues surrounding China in these particular ways at this moment in time.

ACKNOWLEDGMENTS

Special thanks to Fanny Chan and Lin Yiping for their help with this chapter. I am also grateful to Sebastian Veg and Sharon Mazzarella for their comments on an earlier draft.

NOTES

- 1 The Romanization of Chinese names does not follow any single system in this chapter. While *pin yin* is used for names and phrases associated with films from the People’s Republic of China, other systems (or commonly used English renderings) are used for names associated with other places and/or Chinese dialects.

- 2 It is interesting to note that Tian Zhaungzhuang, the film's director, started his career with a very different sort of film set in Inner Mongolia, *On the Hunting Ground* (1985).
- 3 Although this chapter examines Chinese-language cinema, an exception is made in this case because this Japanese-language film, made by a Chinese-speaking director, is clearly part of Hou's oeuvre and in conversation with other Chinese-language films analyzed here.

Violent Content on US Television

A Historical Overview of the Research

Nancy Signorielli

ABSTRACT

This essay examines the portrayal of violence on US television from both a historical and current perspective. It reviews the results of 40 years of content analysis research conducted as part of the Cultural Indicators Study as well as research conducted by the National Television Violence Study between 1993 and 1996. The essay focuses on violence in television programs as well as those characters who commit and/or are victimized by violence. Finally, the essay examines contextual elements of violence portrayals in terms of programs and characters.

Violence on television has been a critical societal concern since television entered our homes in the 1950s. Most of the attention and research on violence have focused on its portrayal and its effects, particularly in relation to children. This chapter will discuss the portrayal of violence on US television from a historical perspective and will examine what we know about television violence at the start of the second decade of the twenty-first century. It will discuss how violence has been defined in this research, how public policy has been an important component fueling research on television violence, as well as some theoretical perspectives relating to the portrayal of violence. The predominant focus is on television violent content in a US context.

As we progress in the twenty-first century, although we spend more and more time with “screens,” the screen we still watch the most is television (Blair, 2009). Today, however, the way we watch has changed from the decades when we only could watch the “big three” networks (ABC, CBS, NBC), perhaps PBS, and maybe a UHF station. Now broadcast network television as well as cable channels, while still designed to appeal to the general audience, seek more narrow audiences. Television has also become an “on demand” medium. We can purchase DVDs, whole seasons of our favorite programs, and can call up movies and programs whenever and, to some extent, wherever we want “on demand” (Gandossy, 2009). Consequently, we are no longer tied to the time-bound schedules of broadcast television or cable channels. In addition, we spend more and more time watching television on computers and the World Wide Web, mobile phones, gaming devices, and MP3 players that do more than just play music. Images and screens thus take up a substantial portion of our day.

Nielsen (2009) reports that viewing statistics are stable and have been rising for the past few years. At the end of 2008 the average person watched TV in their home for about 5 hours a day or more than 150 hours a month. Watching TV on a mobile phone could add another 3.5 hours a month, and watching on the Internet another 2.5 hours a month. Moreover, about 7 hours a month of viewing were “time-shifted” programs. Children’s media use and television viewing remained high. The most recent report of the Kaiser Family Foundation, a survey of 2,000 youngsters between 8 and 18, found that children’s media use averaged more than 7.5 hours a day, a figure that expanded to almost 11 hours a day when multitasking was taken into account (Rideout, Foehr, & Roberts, 2010). Children watched television for 4.5 hours a day, which included 24 minutes watching TV or movies on the Internet, about 15 minutes watching on their cell phones, and another 16 minutes watching on their iPods. The Nielsen report (2009) also found that viewing increased with age. Young adults between 18 and 24 watched almost 4 hours a day, those between 25 and 45 watched almost 5 hours a day, while those older than 45 watched more than 6 hours a day. Consequently, at the end of the first decade of the twenty-first century, few escaped exposure to television.

Television’s role for the past 60 years as the central and most pervasive mass medium in US culture has not changed. Television still plays a distinctive and historically unprecedented role as our nation’s most common, constant, and vivid learning environment. Television, whether we watch on a traditional set, on our mobile phone, or on the Internet, is still our primary storyteller, telling most of the stories to most of the people, most of the time. Stories are found in dramas, action-adventures, situation comedies, reality programs, the news, and even commercials. These stories, however, are the product of a few multinational and centralized commercial institutions. Television’s stories show and tell us about life – its people, places, power, and fate – as well as how things work and how to solve problems. Characterizations represent the good and bad, the happy and sad, successes and failures, and show who’s on the top and who’s on the bottom of the economic ladder

and/or pecking order. As such, characters do not live or die but are created or destroyed to tell the story.

Common themes cut across all programs and present aggregate and conventional images. Commercial constraints, however, limit the diversity of television content (Morgan, Shanahan, & Harris, 1990). Television thus cultivates a common world view and common stereotypes through a relatively restrictive set of programs, images, and messages. One such set of images, in particular, relates to violence.

This chapter will focus specifically upon the portrayals of violence on US television, most often discussing prime-time broadcast programming as this is where the lion's share of the research has been conducted. The review will discuss television violence from a historical perspective as well as discussing the existing research, focusing specifically upon research that has been conducted and published during the first decade of the twenty-first century. In addition, in order to provide the most up-to-date assessment of violence on prime-time television, the review will present and discuss data from the author's ongoing yearly content analyses of week-long samples of prime-time network programming broadcast each fall between 2000 and 2009. The data set consists of 783 programs and 3,268 major or leading characters. The methods used in this ongoing research can be reviewed in several recent publications by the author (see, e.g., Signorielli, 2003). Although important, this review will not discuss violence in videogames (since another chapter in this volume covers that topic), nor will it discuss effects of television violence.

The Policy Perspective

In the past 40 years US public concern about television violence has fluctuated, almost cyclically. Between 1968 and 1978 there was considerable public concern and numerous Congressional hearings about the amount of violence on television. Most, if not all, of these hearings did not result in substantive action (Hoerrner, 1999). Public debate subsided during the 1980s era of deregulation. Concern about television violence surfaced again in the early 1990s with the passing of the Television Violence Act (designed to protect the networks, for three years, from antitrust action if they joined to talk about ways to reduce violence on television). Toward the end of 1992, when it appeared as though little had changed in regard to television violence, the close expiration date of the Television Violence Act prompted its author, Senator Paul Simon (D-Illinois), to warn of harsher legislation. The result was a renewed promise by network executives that they would explore ways to reduce violence in prime time (Dustin, 1992). In 1993, for the first time since the late 1970s, Congressional hearings on television violence were held and a number of separate bills relating to television violence were introduced in Congress (Hoerrner, 1999). In response to Congressional concern, the television industry implemented parental "advisories" before those programs they designated as "violent."

These advisories, however, did not adequately solve the problem and an amendment was added to the Telecommunications Act of 1996 that mandated all television sets 13" or larger, manufactured after 1999, be equipped with the V-chip, an electronic device that enables parents to screen and block the programs their children watch on television. The television industry was asked to develop a rating system to use with the V-chip to filter violent and sexually explicit programming (Federal Communications Commission [FCC], 2000). The result was the implementation of ratings (TV-G, TV-PG, TV-PG14, TV-M, TV-Y, TV-Y7, and TV-Y7-FV), similar to those used by the motion picture industry, supplemented by advisories for content (V-violence, S-sexual situations, D-suggestive dialogue, and L-language).

In the late 1990s, a Kaiser Family Foundation study of programs on 10 major US broadcast and cable channels (Kunkel, Farinola, Farrar, Donnerstein, Biely, & Zwarun, 2002) found that the ratings did not adequately reflect content. For example, while 7 out of 10 PG-14-rated programs had violence, 1 out of 5 G-rated programs and more than half of the PG-rated programs also had violence. Moreover, many of the programs that had violence were not given the content-based "V" rating and many children's violent cartoons were not given the "FV" (fantasy violence) label. Similarly, Signorielli's (2005) analysis of nine week-long samples of prime-time network programs broadcast between 1997 and 2003 found that 9 out of 10 programs had an age-based rating while only 4 out of 10 had a content-based rating. While those programs with age- and particularly content-based ratings accurately reflected the degree of violence in the program, many programs with violent content were not given the "V" content-based rating. Unfortunately, while half of the parents surveyed by the Annenberg Public Policy Center at the University of Pennsylvania in June 2000 said that they were aware of the ratings, very few said that they actually used them (Woodward, 2000). Finally, there is evidence that ratings are most often used by those parents who are very much aware of the problems television viewing may pose to their children. In short, advisories, age- and content-based ratings, may be "preaching to the choir" (Abelman, 1999, p. 544).

The Theoretical Perspective

Numerous theories explain why the study of television violence is important and how it may affect viewers, especially children. Desensitization (see Potter, 1999) and social learning/social cognitive theory (Bandura, 2009), for example, examine the immediate and typically harmful effects of viewing violence. Desensitization or "conscience-numbing effects" (Bushman, Huesmann, & Whitaker, 2009, p. 364) suggests viewing media violence results in viewers becoming less sensitive or sympathetic to real-life violence; viewers may have less empathy and are less willing to help victims of violence. Priming is also an important theory. Berkowitz (1984), for example, posits that exposure to media violence may move viewers, especially those

who may be frustrated or angry, to be poised to behave aggressively in certain situations. Similarly, Huesmann's (1988) social informational processing theory posits that viewing violence may lead to the development of scripts about violence that provide guidelines about what to do in certain situations or what kinds of consequences might result from certain aggressive behaviors.

Cultivation theory and the Cultural Indicators paradigm, on the other hand, look at viewing violence from a cumulative, long-term perspective and examine institutional policy perspectives, messages about violence on television, and what it means for viewers to live with violent television images. Cultivation theory argues that to understand the effects of viewing on attitudes, beliefs, and behaviors we must examine television as a collective symbolic environment with an underlying formulaic structure (Morgan, Shanahan, & Signorielli, 2009). Commercial constraints necessitate that common themes cut across all programs. These, in turn, cultivate common world views and stereotypes. Violence is one such theme and is especially important in the cultivation perspective because people are more likely to experience violence when they watch television (whether in news or entertainment programs) than in real life. Consequently, cultivation theory predicts that people's conceptions about violence are more likely to reflect the messages about violence they see, day in and day out, on television. Cultivation research has found that those who watch more television are more likely to view the world as a mean and scary place, to believe that crime and violence are more prevalent than they actually are, and to take precautions to protect themselves, their homes, and their families against crime (Gerbner, Gross, Morgan, & Signorielli, 1994).

Defining Violence

Research on television violence has, for the most part, focused on physical violence. There have been relatively few studies of psychological (emotional/verbal) violence (see, e.g., Mustonen & Pulkkinen, 1997) because psychological violence is more difficult to define, both conceptually and operationally, and to isolate consistently. In fact, measures of psychological violence often do not meet the discipline's standards for reliability.

Research conducted in the Cultural Indicators paradigm defines violence as "the overt expression of physical force (with or without a weapon, against self or other) compelling action against one's will on pain of being hurt or killed, or actually hurting or killing" (Signorielli, Gross, & Morgan, 1982, p. 163). This focus includes all plausible and credible violence. Comic violence in a humorous context is included because humorous violence may increase the risk of learning aggressive behaviors (Baron, 1978; Berkowitz, 1970). "Accidental" violence and violent "acts of nature" are also included because such actions are purposeful, claim victims, and demonstrate power. In fiction, writers add such scenes to programs to propel the story and

perhaps to eliminate or incapacitate certain characters. Interestingly, gatekeepers of some recent reality programs (e.g., *Survivor*) have added physical violence between “contestants” or “participants” to maintain interest in the competition or day-to-day group activities.

The National Television Violence Study (NTVS), conducted during the mid-1990s, also focused on physical violence. This project defined violence as “any overt depiction of a credible threat of physical force or the actual use of such force intended to physically harm an animate being or group of beings” (Wilson, Colvin, & Smith, 2002, p. 41). The NTVS thus included credible threats of physical violence, rather than psychological or emotional violence, and also included “depictions of the harmful consequences of unseen violence” (Wilson et al., 2002, p. 41). In addition, the framework of the NTVS was sensitive to the context in which violence was presented (committed by heroes or villains, punished or rewarded, etc.) and brought context to the foreground as an important element in the portrayal of violence on television.

Historical Perspective of US Television Violence

Concerns about television violence have sparked intense debate since television’s earliest days. There is general agreement that there is violence on television, but because of differences in the way violence is defined and measured, there is little agreement, and considerable controversy, about the degree or amount of violence (Lometti, 1995; Signorielli et al., 1982; Signorielli, Gerbner, & Morgan, 1995). But, even though these differences exist, there is ample evidence that violence is an ongoing and important element of television programming, particularly during the prime-time hours (Hetsroni, 2007; National Television Violence Study, 1997, 1998, 1999; Signorielli, 2003; Smith, Nathanson, & Wilson, 2002).

The earliest content analyses of television programming (Head, 1954; Smythe, 1954) coded programs “off the air” and found considerable violence in samples of New York City television programming. Violence appeared in two-thirds to three-quarters of all television plays at a rate of 6 to 10 incidents per hour in prime time and at rates three or four times as much in children’s programming (mostly cartoons). Dominick (1973), in an analysis of all prime-time programs broadcast during February 1972, found that two-thirds of the programs contained some violence and that 60% of the violence could be categorized as assault, armed robbery, or murder. Unlike real life, violence by strangers was more frequent than violence by someone who was known to the victim. In another study of programming aired during the mid-1970s, Dominick (1978) noted that television presented violence from a law enforcement point of view, emphasized personal violence, ignored social aspects, did not present an adequate picture of the legal process, and did not provide accurate information about crime, criminals, and real-life violence. Similarly, Haney and

Manzolati (1980) found that television crime and violence emphasized greed and other personal characteristics but rarely addressed underlying social conditions.

An analysis of television series with law enforcement or other violent themes broadcast between 1950 and 1976 (Taylor & Dozier, 1983) found that violence was systematically presented within a framework suggesting that people have an unquestioned moral and/or legal right to use violence, including deadly force, to protect the status quo. Finally, Greenberg, Edison, Korzenny, Fernandez-Collado, and Atkin's (1980) analysis of dramatic series in three seasons of programming in the mid-1970s found that violence (defined as "physical aggression") occurred more than 9 times per hour between 8:00 and 9:00 p.m., more than 11 times per hour between 9:00 and 11:00 p.m., and more than 21 times per hour during Saturday morning children's programs.

During the 1970s, 1980s, and 1990s most of our knowledge of violence on television came from the Cultural Indicators (CI) Project. The NTVS contributed to our knowledge about television violence in the mid-1990s. The CI Project examined and measured the amount of physical violence on television by monitoring prime-time and weekend daytime network broadcast television programming and studying relationships between television viewing and conceptions of social reality (Gerbner, Morgan, & Signorielli, 1994; Gerbner, Gross, Morgan, & Signorielli, 1980a, 1980b, 1986; Gerbner & Signorielli, 1990; Morgan et al., 2009; Signorielli, 1990), periodically publishing the results as the violence profile.

One of the early reports of the CI Project looked at violence in prime-time and Saturday morning programs broadcast between 1967 and 1975 (Gerbner & Gross, 1976). This report found violence in more than 8 out of 10 programs with an average of 5 violent actions per program and 7 acts of violence per hour. Over half of the major characters were involved in violence, either committing violence, being a victim of violence, or both, and 1 in 10 major characters was involved in killing.

Another report (Gerbner et al., 1994) found, for samples of prime-time programs broadcast between 1973 and the fall of 1992, that violence appeared in 7 out of 10 programs at the rate of 5.3 incidents per hour and 4.6 incidents per program and that half of the major characters in these programs were involved in violence. Moreover, the figures reported for the samples of programs broadcast during the early 1990s were under the CI Project's 25-year averages. In the sample of programs from the 1992–1993 season, while 65% of prime-time fictional dramatic programs contained violence and 46% of the characters were involved in violence, the average frequency of violent acts was 2.9 per hour, about three-fifths of the 25-year average.

The NTVS (Smith et al., 1998; Wilson et al., 1997, 1998) examined physical violence in three yearly samples (1994–1995, 1995–1996, and 1996–1997) of three composite weeks of programming across 23 channels operating between 6:00 a.m. and 11:00 p.m. each day. The sample ($N = 8,200$) included broadcast (commercial networks, independent stations, and public television) and cable channels (basic and premium offerings). All genres except game shows, religious programs, "infomercials," or home shopping channels, sports, instructional programs, and news were included (Smith et al., 1998).

The NTVS found similar levels of violence and no change in the prevalence of violence from the 1994–1995 to the 1996–1997 television seasons; 58% of the programs in the 1994–1995 sample, 61% of the programs in the 1995–1996 sample, and 61% of the programs in the 1996–1997 sample contained violence. There was, however, in prime time (8:00 p.m. to 11:00 p.m.), an 8% increase in the overall level of violence in cable and broadcast programs; 59% of the programs in the 1994–1995 sample, 66% of the programs in the 1995–1996 sample, and 67% of the programs in the 1996–1997 sample contained violence. The largest increase from 1994–1995 to 1996–1997 (14%) was found for those programs broadcast on the commercial networks. This study thus found in prime time, the time of day that draws the largest share of viewers, an increase in the percentage of programs with violence.

A more recent examination of the 1996–1997 NTVS data set (Smith et al., 2002) found that the amount of violence in prime-time programs was similar to that found in programs aired during other times of the day. Violence was found in 6 out of 10 programs and the rate of violent interactions in prime time was 6.6 per hour compared to 6.4 per hour during other day parts. This analysis found that 67% of broadcast network programs contained violence at a rate of 5.2 violent interactions per hour, figures similar to those for programs on basic cable. Premium cable programming, particularly the movie channels, had the most violence – 88% of the programs at 12.4 violent interactions per hour.

There were two other studies of television violence in the programming of the 1990s. An industry-funded study (ABC, CBS, NBC, Fox) monitored at least four episodes of every prime-time and Saturday morning (7:00 a.m. to noon) network program in each of three seasons (1994–1995, 1995–1996, and 1996–1997) and two weeks of programs on independent stations, public television, and pay cable (Cole, 1995, 1998). While this analysis did not provide overall measures of the level of violence in these samples between 1994–1995 and 1996–1997, there was a drop in the number of television series that raised frequent concerns about the way violence was presented. The only programs that raised more concerns at the end of this three-year period were reality shows (e.g., *World's Most Dangerous Animals*, *World's Scariest Police Chases*).

The Center for Media and Public Affairs (Lichter & Amundson, 1992) isolated physical violence on 10 channels (network, independent, and cable) during one day. Violence appeared most frequently during the afternoon (2:00 to 5:00 p.m.) with 19.1 acts per hour, in the early morning (6:00 to 9:00 a.m.) with 15.8 acts per hour, and during prime time (10.2 acts per hour). In an update, Lichter, Lichter, and Amundson (1999) isolated acts of violence in two randomly selected constructed weeks of prime-time network and cable fictional programs ($N = 284$) and 50 movies on cable and broadcast television during the 1998–1999 season. They found 12 acts of violence per episode (half were “serious”) in broadcast programs and 10 acts per episode (half were “serious”) in cable programs.

US Television Violence Before and After the Turn of the Century

The work of the CI Project has continued into the twenty-first century in the ongoing research of the author. One study (Signorielli, 2003) examined television violence in samples of fall network programming broadcast between 1993 and 2001. This analysis found that violence appeared in 61% of the programs at a rate of 4.5 acts of violence per program. The levels found in this analysis were similar to those found in earlier analyses in the CI perspective as well as those found in the NTVS. This analysis, however, found that fewer major characters were involved in violence. Compared to earlier CI analyses (see, e.g., Signorielli, 1990) when more than half of the characters were involved in violence, only one-third of all the characters at the turn of the century were involved in violence. Although more men than women were involved (38% of the men compared to 27% of the women), the proportions of Whites and minorities were almost equal.

Men were more likely to both commit violence and to be victimized – 27% of the men commit violence compared to 19% of the women and 27% of the men were victimized compared to 17% of the women. There were no differences in the percent of Whites and minorities who committed violence or who were victimized. Interestingly, during the 1990s the ratios of hurting to being hurt changed from the patterns seen in the 1970s and through the mid-1980s (Signorielli, 1990) for women but not for men. At the turn of the century, for every 10 male characters that hurt or killed other characters, 11 were victimized, the same ratio found in the earlier analysis. For women, however, instead of 16 women being victimized for each woman who hurt or killed, the odds were now even – women were equally likely to hurt or kill as be hurt or killed.

An analysis of violence in prime-time programs broadcast during the first decade of the twenty-first century was conducted for this chapter to bring our knowledge of the levels of violence in prime-time programming up to date. The methods used in this analysis are the same as those used in Signorielli (2003), extending that analysis to samples of network programming broadcast in the fall of each year between 2000 and 2009.¹ The variables used the same definitions in all of the CI-related research and meet all standards for reliability.

This new analysis shows that while some elements of the portrayal of violence have escalated in the first decade of the twenty-first century, others have declined. The percent of programs with violence, for example, increased from 61% of the prime-time programs broadcast in the 1990s to 69% of the programs in the decade after the turn of the century, a difference that is statistically significant ($F = 4.21$, $df = 1,1395$, $p = .04$). Violence, moreover, increased during the 2000s. There was a statistically significant increasing linear trend in the percent of programs with

violence from the fall of 2000 to the fall of 2009 ($F = 19.4$, $df = 8,774$, $p = .000$). The percent of programs with violence rose from a low of 53% in the fall of 2000 to a high of 85% in the fall of 2008 but dropped to 79% in the fall of 2009. The number of violent actions, however, remained steady with an average of 4.6 acts of violence per program and no evidence of any increasing or decreasing trends.

There were differences in the involvement of characters in violence. Data from the first decade of the twenty-first century show that there were no statistically significant differences from the 1990s in the overall percent of characters involved in violence (36% of all characters). Again, proportionately more of the men (42%) than the women (28%) were involved in violence but, as seen in the 1990s, the percent of Whites and people of color involved in violence was essentially the same (about 25%). Although more men than women were involved in violence, both men and women were equally likely to hurt or kill others as be hurt or killed themselves. Interestingly, after the turn of the century, involvement in killing increased significantly for both men and women. In the last decade of the twentieth century 9% of the men and 5% of the women were involved in killing. By comparison, in the first decade of the twenty-first century, 12% of the men and 7% of the women were involved in killing, differences that are statistically significant ($\chi^2 = 20.54$, $df = 1$, $p = .00001$ ($N = 7,256$)).

The Context of Violence

The NTVS elevated the importance of the context of violence in understanding how violence is seen on television. Two contextual elements in the early research of the CI Project were the appearance of humorous violence and the significance of violence in the plot or storyline. Some of the earliest research in the observational learning/social cognitive perspective (Bandura, 1986, 1990; Bandura, Ross, & Ross, 1961, 1963) along with other early studies of symbolic aggression (Lovas, 1961) found that youngsters often learn and reproduce violent behaviors seen in cartoons, i.e., humorous violence. At the same time, cultivation theory posits that humorous violence is an effective way to convey lessons of power. Although comic violence may appear less threatening, the actions are often mean-spirited with few realistic consequences, a sure formula for influence. These lessons may then translate to viewers developing conceptions of living in a mean and dangerous world and overestimating chances of being involved in violence by those who watch more TV (Gerbner et al., 1980a).

Cultivation theory also explains the significance of violence in the plot reflected in the complex social scenario illustrated by the patterns of committing violence and victimization in characterizations as well as the frequency of violence in the program. These elements ultimately cultivate a sense of fear, intimidation, and vulnerability reflected in the positive relationships between television viewing and scores on both the Mean World Index and the Index of Alienation and Gloom (Signorielli, 1990). In

short, the more violence there is and the more important it is for the storyline, the more likely viewers believe that they live in a mean and dangerous world. Similarly, those who watch more television, particularly if they have been to college, are more likely to feel more bored, depressed, and lonely (Morgan, 1984).

Our knowledge about the context of violence comes from early studies of the CI Project that examined humor and program genre. During the 1970s slightly more than a quarter of prime-time programs were comic in nature and less than half (45%) included violence at a rate of 2.0 incidents per program and 3.6 incidents per hour. In addition, close to half of the network prime-time programs were action-adventures, an exceptionally violent genre, with 94% containing some violence at a rate of 7.8 incidents per program and 6.8 incidents per hour (Gerbner et al., 1980b). Similarly, Signorielli (1990) in an analysis through the fall 1985 sample found that only one in five prime-time programs had humorous violence.

The examination of graphic, immoral, intentional, and justified violence as well as the portrayal of the physical consequences of violence are also critical to the understanding of the context of television violence. Each of these elements is supported by several theories, including desensitization (Potter, 1999) and social learning/social cognitive theory (Bandura, 1986). Cultivation theory is also relevant because it explores how these elements relate to how different groups of viewers perceive their own vulnerability. Specifically, heavy viewers are more likely to believe they will be victims of violence and consequently more likely to buy more guns and locks as well as have watchdogs for protection (Gerbner, Gross, Morgan, Signorielli, & Jackson-Beeck, 1979).

The NTVS advanced our understanding of the contextual elements in the portrayal of violence on television in the mid-1990s (Smith et al., 1998; Wilson et al., 1997, 1998). The NTVS examined the consequences of violence, whether or not humor was involved, the graphic nature of the violence, whether or not weapons were used, and the degree of realism. The analysis of data from the 1994–1995 sample found that the context in which violence is presented posed risks for viewers (NTVS, Executive Summary, 1994–1995). In particular, three-quarters of the violent scenes had unpunished perpetrators, negative consequences of violence were rarely presented, one-quarter of the violent incidents involved the use of a handgun, and fewer than 1 in 20 programs emphasized antiviolence themes. Yet, television violence was not particularly graphic. While the analysis found that broadcast network programs had less violence than cable channels, the context of violence on both broadcast and cable was similar.

The NTVS also examined year-to-year changes in the portrayal of the contextual elements of violence. Looking specifically at violent broadcast programming, only 35% of the prime-time programs in 1994–1995, 23% of the programs in 1995–1996, and 24% in 1996–1997 had any long-term negative consequences of violence. At the same time, there was no display of remorse, regret, or sanctions in 6 out of 10 of the violent scenes in these samples. Similarly, while two-thirds of the violent interactions in the 1994–1995 sample did not show any pain as a result of violence, the

proportion dropped to slightly more than half of the violent interactions (54% in the 1995–1996 sample and 53% in the 1996–1997 sample). This analysis indicated that violence on television, examined at the program, scene, and interaction level, was antiseptic and devoid of pain and suffering.

Smith and colleagues (2002) found that prime-time broadcast network programming and basic cable programming were less likely than premium cable programming to include violent interactions that depicted pain or harm. The violent interactions in premium cable programs also were more likely to show long-term consequences of violence than the network broadcast programs or the basic cable programs. Moreover, prime-time network broadcast programs were relatively devoid of pain and suffering.

Potter and Smith (2000), in an analysis of data from the second year of the NTVS (1995–1996), examined graphic portrayals of violence. This analysis found that most violence presented a low level of graphicness and that the violence in fantasy programs rarely exhibited graphicness. High levels were found in only 1 out of 10 violent actions. Moreover, it was presented with a high degree of realism. That is, the violence in live-action programs (recreated reality programs) had human targets and perpetrators. The use of guns and knives (shooting or stabbing a victim) was also related to higher levels of graphic violence.

Potter and colleagues' (1995) analysis of a composite week (6:00 p.m. to midnight) of programs broadcast on ABC, CBS, Fox, and NBC in the spring of 1994 also found that aggressive acts were typically presented in a context-less venue; fewer than one in six acts was depicted with any major consequences, only one in six acts was punished, while one-third were actually rewarded. While Potter and Ware (1987) found that only 1 in 10 acts of violence was punished and that heroes and villains were equally likely to commit antisocial acts, violence, at least from the perspective of the perpetrator, was seen as justified. Similarly, Lichter, Lichter, and Amundson (1999) found that most television violence did not have either psychological or physical consequences and occurred in a moral vacuum because heroes saw the violence they committed as justified (in self-defense, in a law enforcement context, etc.).

Signorielli's (2003) analysis of programming broadcast between 1993 and 2001 found that 39% of the programs did not have violence, that violence was an important element of the plot (significant or major) in 34% of the programs, and that 29% of the programs had violence that was not important to the story (minor to the plot). On the other hand, there were changes in the presentation of violence in the last 10 years. The analysis of data from 2000 to 2009 found that the percent of programs without violence decreased to 31% of the programs, while 43% of the programs had violence that was significant to the story and 26% had violence that was not particularly important to the story (minor plot element). Interestingly, there was a significant linear trend in the percent of programs with violence – in the fall of 2000 half of the programs (53%) had violence while in the fall of 2009 almost 8 out of 10 programs (79%) had violence.

Prime time is also more likely to have violence that is serious rather than comic in nature. At the end of the twentieth century, Signorielli (2003) found serious violence in 37% of the programs and comic violence in 18% of the programs. Once again, there were no trends in the appearance of this element of the context of violence. There was, however, some change in the portrayal of comic and serious violence at the start of the twenty-first century. Almost half of the programs broadcast after 2000 had violence judged to be serious in nature while only 13% had comic violence. In addition, while the percent of programs with comic violence did not change between the fall of 2000 and the fall of 2009, the percent of programs with serious violence increased during this time period from 40% of the programs at the first part of this decade to 60% of the programs at the end of the decade. (There is a statistically significant linear trend. $F = 11.65$, $df = 8,774$, $p = .0007$.)

Similar to the findings of the NTVS, Signorielli (2003) found that contextual elements did not appear very frequently during prime-time broadcast programs. More than 4 out of 10 programs had no context of violence. Violence that was intentional was found in 4 out of 10 programs, while justified violence, immoral violence, and showing the consequences of violence were found in about a third of the programs. Gratuitous and graphic violence occurred least often, appearing in a quarter of the programs. Overall, the average number of contexts was 1.8 per program, while programs with violence had an average of 2.9 contexts of violence per program. Moreover, there was a statistically significant linear trend. In short, the number of programs that included a context for violence in the story increased during the 1990s from 1.2 contexts per program in the spring of 1993 to 3.8 contexts per program in the fall of 2000.

The numbers of programs including contexts of violence in the storyline continued to increase during the first decade of the twenty-first century. Overall, only 34% of the programs in this decade compared to 44% of the programs in the last decade of the twentieth century had no context of violence. Interestingly, all of the contexts of violence (immoral violence, intentional violence, graphic violence, justified violence, and consequences of violence) except gratuitous violence increased. Specifically, almost half of the prime-time network programs broadcast after 2000 showed the context of violence compared to about a third of the prime-time network programs broadcast before 2000. Moreover, the average number of contexts per program increased from two contexts per program in 2000 to almost three contexts per program in the fall of 2009 ($F = 9.71$, $df = 8,774$, $p = .002$).

Signorielli's (2003) analysis of characters in programs broadcast during prime time in the 1990s found little information about the context in which characters commit violence. Only 13% of the men, 5% of the women, 9% of the Whites, and 9% of the characters of color who committed violence were either rewarded and/or punished for their behaviors. Similarly, 14% of the men, 11% of the women, 13% of the Whites, and 12% of the characters of color were presented as committing violence that was justified. Remorse was rarely found, exhibited by only 4% of the men, 3% of the women, 3% of the Whites, and 4% of the characters of color. And finally,

only 9% of the men, 5% of the women, 7% of the Whites, and 7% of the characters of color were portrayed as having committed immoral violence. Overall, gender differences were statistically significant but race differences were not.

Between 2000 and 2009, although the percentages of characters shown in relation to a context of violence increased slightly, there was still little information about the context in which characters committed violence. Only 15% of the males, 8% of the females, 11% of the Whites, and 12% of the characters of color committed violence that was rewarded or punished. Men were a little more likely (17%) than women (12%) to commit justified violence while Whites and people of color were equally likely (14%) to commit justified violence. Again, few characters committed immoral violence (10% of the men, 5% of the women, 8% of the Whites, and 7% of the people of color), and even fewer characters (5% of the men, 3% of the women, and 4% of both Whites and people of color) exhibited any remorse for the violence they committed.

Violence in US Children's Programs

Children's cartoons have a considerable amount of violent content. One of the first studies of children's television found that over half of the children's programs monitored during late October 1960 contained violence that was an important part of the story (Schramm, Lyle, & Parker, 1961). Poulos, Harvey, and Liebert (1976), in an analysis of programs on two Saturday mornings during the 1974–1975 television season, found that three-quarters of the programs contained violence. Liss and Reinhardt (1980) found that Saturday morning network prosocial programs in the late 1970s were just as violent as regular cartoons. Similarly, Greenberg and colleagues (1980), in a study of Saturday morning programs broadcast between 1975 and 1978, found that cartoons contained more acts of violence than programs broadcast during the prime-time hours.

Studies in the CI tradition consistently found high levels of violence in samples of children's weekend-daytime programs broadcast in the fall of each year. For example, between 1967 and 1978, violence was found in 94% of these programs at a rate of 6 acts of violence per program, 18 acts of violence per hour, and involved 80% of the characters (Gerbner et al., 1979). The last CI analysis of children's weekend-daytime programs examined samples broadcast between the fall of 1973 and the fall of 1992 (Gerbner et al., 1994) and found violence in 92% of these programs at a rate of 7 acts per program, 23 acts per hour, and involved 80% of the characters.

The NTVS examined children's programming aired between October 1995 and June 1996 (Wilson, Smith et al., 2002). The analysis found violence in 69% of the programs targeted to children under the age of 13. Moreover, the violence was more concentrated in children's compared to regular programming. Violent incidents, interactions between perpetrators and targets (PATs), occurred 14 times an hour

compared to 6 times an hour in non-children's programs. In addition, there were 7 scenes of violence per hour in children's programs compared to 3 per hour in non-children's programs. The amount of time devoted to violence, however, was similar for both children's and non-children's programs.

The NTVS analysis of prime-time programs also examined the context of violence in children's programs. Wilson, Smith, and colleagues (2002) found that violence was more sanitized and trivialized in children's programs. While more than half of the violent incidents involved lethal violence, the violence was rarely graphic. At the same time, a third of these violent scenes were rewarded and 8 out of 10 scenes had no type of punishment. Similarly, about two-thirds of the violent incidents showed no consequences of violence or physical injury to the victim, but three-quarters of the scenes presented violence in a humorous context. Moreover, the degree of violence was related to the type of children's program. Slapstick (*Tom & Jerry*), Superhero (*Power Rangers*), and adventure/mystery (*Scooby Doo*) programs had considerably more violence than programs focusing on social relationships (*Care Bears*) or magazine formats (*Barney*). Overall, Wilson, Smith, and colleagues (2002) concluded that violence in children's programs proposed considerable risks for young viewers.

There is not much information about the characters who are involved in violence in children's programs. Poulos and colleagues (1976) found that half of the violence committed in children's programs was by White males and half by animal (typically anthropomorphized) characters. Gerbner and colleagues (1994) found that more of the male characters than female characters in children's programs were involved in violence. Overall, more of the characters in children's programs were involved in violence and they were more likely to be victims of violence than to commit violence. Leaper and colleagues (2002) found that males exhibited more physical aggression and were victims of aggressive behavior in adventure and comic genres, while females were shown as fearful.

Similarly, the NTVS found that perpetrators in children's programs often were animals or other anthropomorphized creatures and that humans involved in violence were likely to be males. In addition, those who committed violence in these programs often were praised or even rewarded with material goods. At the same time, the victims were not portrayed realistically. Violence was sanitized so that victims did not exhibit pain or suffering and there were few signs of the types of physical injuries that would realistically be expected from the violence they suffered (Wilson, Smith et al., 2002).

A recent analysis of children's programs conducted in the CI tradition (Signorielli, 2008) examined 147 Saturday morning children's programs aired between 8:30 a.m. and 1:00 p.m. on ABC, CBS, NBC, Fox, CW, Cartoon Network, Nickelodeon, and Disney during the month of February 2007. Violence appeared in 86% of these programs at an overall rate of 7.0 acts of violence per program and 16.7 acts of violence per hour. Adventure programs (e.g., *Teenage Mutant Ninja Turtles*) were the most violent, with 98% having some violence and close to two-thirds with violence that was a significant part of the story. While 7 out of 10 teachy-preachy

programs (e.g., *Veggie Tales*) were violent, most of this violence was not an integral part of the story. Half of the teen-scene programs (e.g., *That's So Raven*) had some violence but it rarely was an important part of the story. Once again, hourly rates of violence were high. While the entire sample had 17 acts of violence per hour, there were differences by genre. Adventure programs had 23 acts of violence per hour, teachy-preachy programs had 8 acts per hour, and the teen-scene programs had 4 acts per hour.

The violence in these children's programs was somewhat sanitized in that there was little, if any, graphic violence. At the same time, the violence was often presented as intentional and immoral. Characters' involvement in violence remained at high levels. The only major difference between today's programs and those of 30 years ago was that in 2007 the female characters had a greater likelihood of committing violence and were less likely portrayed as victims of violence.

Conclusion

Overall, we have not seen much change in the levels of violence in US prime-time network broadcast programs and in children's programs. From the 1950s to the first decade of the twenty-first century, violence has been an important and significant element of television programs. While, the overall amount of violence varies by genre (crime and action programs have more violence), it is still relatively difficult to escape watching violence. While the more diverse programming of the twenty-first century gives viewers opportunities to find nonviolent programs through "on demand" technologies, in order to totally avoid television violence a viewer must be adept in using these new technologies and take the time to implement them.

In short, the overall levels of violence have not changed and, if anything, have increased since the turn of the century. The overall numbers of major characters actually seen committing violence or being victims of violence, however, have diminished. Some of this may be due to the very popular crime-scene programs such as *Law and Order* or *CSI*, which focus on a crime that has already been committed and show, through the use of technologies (some of which may not really exist) (Houck, 2006), how crimes are solved and, for the most part, the perpetrators brought to justice.

At the same time, the portrayal of violence in programs of the first decade of the twenty-first century continues to show gender differences but few race-related differences. More men than women are involved in violence, primarily because men still outnumber women during prime time (Signorielli & Bacue, 1999). Moreover, within-gender distributions show that the proportion of men involved in violence (about 4 in 10) is considerably larger than the proportion of women involved in violence (about 1 in 4). Both men and women, however, are equally likely to commit violence (hurt or kill others) as to be victims of violence (be hurt or killed). The findings for

gender distributions are similar to those of the NTVS (Smith et al., 1998) but smaller than Gerbner and colleagues' (1980a, 1980b, 1986, 1994) studies of programs from the 1970s and 1980s.

Another interesting difference is that the presentation of the context of violence has become somewhat more important. Through the 1990s and into the first decade of the twenty-first century, programs have begun to show that violence may have consequences, may be intentional in nature, and may be presented as justified in relation to the story. There is, however, little graphic or gratuitous violence, which, in turn, may reduce the amount of visual gore and thus show less realism. This has serious implications because less realistic images may result in viewers learning scripts of aggressive behavior and storing them for possible use in the future (Potter, 1999).

Similarly, even though today's programs may give more information about the context of violence overall, television may still not adequately support or reinforce the lesson that "crime does not pay." Indeed, the context in which characters commit violence still does not appear very frequently and the characters who commit violence typically are not sorry for their actions, and may not be punished for their transgressions. From a social learning perspective these messages may result in viewers being more likely to learn and even accept aggressive behaviors. Thus, the environment of violent entertainment in which many people, particularly children, spend most of their free time may be potentially harmful for viewers (Smith et al., 1998). Moreover, as Potter and colleagues (1995) conclude, television's lack of realistic contexts for violence may signal that aggression and violence are acceptable. Thus, the long-term effects of watching television violence may result in a vicious cycle. Eron (1982), for example, has postulated that viewing leads to aggressive behavior and those who are more aggressive typically watch more violence.

Finally, as cultivation theory postulates, the ultimate long-term effects of watching television violence may pose threats for civil liberties and freedom. Cultivation studies have found that those who watch more television, compared to those who watch less, are more likely to overestimate their chances of being involved in violence, believe that fear of crime is an important personal problem, and assume that crime is rising (when in actuality it is not). Those who spend more time watching television tend to believe that they are living in a mean and dangerous world as well as express feelings of alienation and gloom (Morgan et al., 2009; Signorielli, 1990). The problem is that today, even though there are more viewing choices, violent images are difficult to avoid; as a result, those who watch more television may become more fearful and alienated. The end result is that they may express sentiments of dependency and be willing to accept deceptively simple, strong, and hard-line political and religious postures if these beliefs seem to promise to relieve existing insecurities and anxieties. From the perspective of cultivation theory, the overall long-term effects of television violence may be the ready acceptance of repressive political and social environments that could translate into a loss of personal liberties.

Blogging Culture

Content and Representation in Blogs

Zizi Papacharissi and Sharon Meraz

ABSTRACT

This chapter examines the evolution of blog content, from the early stages of personal home pages, to the development of the blog format, to A-list blogs that influence other media and public opinion. Blogging content is examined, with a focus on blogging norms, patterns, and dominant trends the form of blogging takes on. As the blogosphere is vast and diverse, the authors consider the plurality of blog content and the functions it serves for multiple bloggers and potential audiences. Blogging content is examined as a form of sociocultural expression, with an analysis of its function and place in contemporary societies. The chapter concludes with a look at what the future holds for blogs and associated, emerging web platforms, in the context of converging media and reflexive societies.

Content is conditioned by context, and context in turn may be reinterpreted through content. The culture of postindustrialization has advanced a transition from existential to self-expression values (Inglehart & Welzel, 2005). Self-expression values refer to the desire to control one's environment, increase one's autonomy, and question authority. Media content lends shape and form to these conflicting and converging tendencies (Bauman, 2001; Giddens, 1990). Blogs epitomize self-expression, in a manner that permits individuals a form of control over their personalized media

ecology, affords a measure of autonomy, even if temporary, and enables the questioning of authority. One could argue that, for contemporary citizens, blogs present a sociocultural practice that reflects and reifies the desire for control, autonomy, and the questioning of authority. Blog content as artifact reflects and reifies these tendencies.

This chapter examines the evolution of blog content, from the early stages of personal home pages, to the development of the blog format, to A-list blogs that influence other media and public opinion. Blogging content is examined, with a focus on blogging norms, patterns, and dominant trends the form of blogging takes on. As the blogosphere is vast and diverse, the authors consider the plurality of blog content and the functions it serves for multiple bloggers and potential audiences. Blogging content is examined as a form of sociocultural expression, with an analysis of its function and place in contemporary societies. The chapter concludes with a look at what the future holds for blogs and associated, emerging web platforms, in the context of converging media and reflexive societies. In line with the volume's focus on content and representation, we begin by mapping the origins and evolution of blogging content. We examine how blogging content differs from that of neighboring media practices, and consider ways of theoretically situating it within contemporary mediascapes and ecologies. To this end, the chapter then considers gender, class, and racial or ethnic representations in blogging content, so as to assess the sociocultural contribution of blogging. Finally, we conclude by examining the meaning of blogging content for networked publics.

Blogging Content: Evolution

Blogs can be traced back to the mid-1990s and are characterized by a diary-like format aimed at primarily documenting the everyday experience. An earlier form of blogs can be traced to personal home pages, which developed as online personal spaces, home to the personal reflections and pursuits of their owners. Personal home pages were characterized by their emphasis on self-expression, introspection, and, in general, a presentation of the self through multi-mediated storytelling (Dominick, 1999; Papacharissi, 2002a, 2002b; Smith, 1998; Walker, 2000). In these discursive spaces, users adapted norms to the online setting to effect connectedness and to self-disclose within architectures heavily influenced by templated design. Blogs evolved out of templates that emphasized the chronological sequencing of storytelling, as websites featuring regular updates, an array of links, and the author's personal take on a variety of issues and events. For most nontechnical users, usage of the early blog format did not deviate from the standard layout of template design (Scheidt & Wright, 2004). With the growth of blogging platforms, the use of blogs became more accessible and was driven by major events, typically major catastrophes or political campaigns (Allan, 2006; Allan & Matheson, 2009). A small number of high-profile

bloggers were responsible for a strong and positive influence on the public perception of blogs, and research has shown that the 9/11 terrorist attack, the Iraqi War, and the 2004 US presidential election campaign were pivotal events that directed media attention to blogs (Hogg, Lomicky, & Hossain, 2008; Trammell & Keshelashvili, 2005).

Nowadays, blogs are typically defined as web pages that consist of regular or daily posts, arranged in reverse chronological order and archived (Herring, Kouper, Scheidt, & Wright, 2004). Internet enthusiasts greeted blogging as a groundbreaking development in the world of news reporting and information dissemination (Gillmor, 2006; Sullivan, 2002). Academics, activists, and a variety of publics recognized the democratizing premise inherent in the practice of blogging, as it affords media consumers the opportunity to become media producers or produsers (Bruns & Jacobs, 2006; Coleman, 2005; Jenkins, 2006). Bloggers present a personalized take on the events of the day, including, but not confined to, news events. It is not uncommon for the abstract, diverse, and heterogeneous collective of blogs, known as the *blogosphere*, to succeed in placing a news item in the mainstream news agenda, or elevate its profile. By creating noise over issues or political candidates initially marginalized by mainstream media, blogs or bloggers frequently function as gateways to mainstream media coverage (Kerbel & Bloom, 2005; Meraz, 2007; Tremayne, 2007; Walker Rettberg, 2008).

Research has shown that blogs can broadly be divided into A-list blogs (popular publicized blogs), blogs that are somewhat interconnected, and a majority of sparsely socially connected and less conversational blogs (Herring et al., 2005). The latter majority of bloggers frequently engages in self-confessional posting that resembles the tone of diary keeping, with few exceptions that engage in journalistically informed punditry (Papacharissi, 2007; Scott, 2007; Sundar, Edwards, Hu, & Stavrositu, 2007). Despite their potentially infinite reach, the majority of non-A-list blogs are typically assembled with a smaller audience in mind, one that closely mirrors the individual's personal social sphere. Thus, content produced frequently merges what media theories have classified in the past as the distinct categories of the "informational" and "social" into news that is personal, social, and participatory (Purcell, Rainie, Mitchell, Rosenstiel, & Olmstead, 2010).

Numerous Pew Internet and American Life Project reports have revealed that most early blogging content was created by men, although the difference margin was slight (57%; Rainie, 2005), and debatable, and has by now evened out (Lenhart & Fox, 2006). Bloggers tend to be younger users under 30, with considerable Internet experience, and the proportion of bloggers who are White is smaller than the proportion of Internet users in general, indicating blog use is more popular among social and ethnic minority Internet users (Lenhart & Fox, 2006). They also tend to be more media and computer literate, pursue a wider diversity of online activities, and get their news online (Lenhart & Fox, 2006). Non-personally oriented blogs are more likely to be authored by older, married, and better educated males, who blog mostly about government and politics to mass intended audiences that they do not know

personally but feel they know rather well (Cenite, Detenber, Koh, Lim, & Soon, 2009). Personal bloggers, on the other hand, are mostly students or IT workers, who tend to express their thoughts or document their lives for smaller audiences they mostly know personally (Cenite et al., 2009). As a result, blogging content frequently serves needs for self-expression and connectivity, met by producing content that blends commentary on public affairs with private introspection and discussion of personal matters.

The Private, the Public, and the Personal in Blogging Content

A hobby for most, blogging is motivated by goals and priorities that are subjective, aimed at connecting bloggers to their social sphere and a variety of publics, and involving them in the process of information production and consumption. Even though the public imagination frequently compares the blogger to the journalist, the two are driven by different needs, or, alternatively, cater to the same ends but from different perspectives. Blog content is determined by subjective inclinations and tendencies based on a personal evaluation of content (Lu & Hsiao, 2007). Even news-oriented, A-list blogs can present a *mélange* of public and private information that is subjectively arrived at and removed from Western standards of the journalistic profession observed by objective or partisan press traditions. Blogs are both public and private, and challenge cultural norms that discern private from public (Gurak & Antonijevic, 2008). The practices of blogging and journalism, however, are compatible, and, to this end, several major news outlets survey blogging content to obtain a public opinion substitute. Most mainstream outlets have incorporated blogging into their traditional reporting and use it to provide in-depth reporting and/or indulge specific journalists' story interests. The symmetrical relationship between independent blogs and traditional mass media is furthered when A-list bloggers are invited to produce guest columns for newspapers or when newspaper columnists are used as sources on A-list group blogs.

The civic merit of blogging content is frequently appreciated by examining how it competes with or completes journalism, thus filling some of the voids created by contemporary media. Within this media landscape, web-related innovation enables direct citizen intervention in the media agenda, reifying citizen journalists, and thus making the democratic space upon which citizens and journalists interact more pluralistic (Bimber, 1998) and directly representative (Coleman, 2005). Online technologies like blogs create content that serves as the material cause of mobilization and public discussion.

As potential opinion leaders, bloggers use their own blogs as public pulpits to express opinions on affairs public and personal (e.g., Scott, 2007; Tremayne, 2007).

Through a web of interconnections with other citizen journalists, activists, and commentators, and with conventional media, blogging content may create sufficient noise to impact the media, public, and policy agendas (Walker Rettberg, 2008). It may take on many forms, which range from the frequently mundane subject matter of personal home pages to the more politically charged content of alternative social movement media (Atton, 2001). Motivated by a watchdog's orientation, blogging content will draw attention to issues marginalized or ignored by mainstream media (e.g., Meraz, 2007; Sundar et al., 2007). Blogging content acquires meaning as it successfully dilutes the singular agenda-setting influence of traditional news sources on the public agenda to present novel, subjective interpretations of what constitutes news. Atomized acts of journalism performed via blogging may, for instance, afford citizens unique storytelling duties and the ability to "place" themselves in the story (Robinson, 2009), or to report on "unknown" stories (Rutigliano, 2009). In this sense, blogging content and mainstream journalism may be understood as complements rather than substitutes to each other (Deuze, 2009; Gillmor, 2009).

Still, blogging content is typically found to be expressive first and deliberative only by accident. A content analysis of a random sample of blogs revealed the design, structure, and content of the average blog to be driven by self-expression and social connectivity (Papacharissi, 2007). Similarly, an ethnographic study of teenage girls' uses of blogs revealed that teen girls used blogs as creative tools for maintaining relationships and expressing identity (Bortree, 2005). These girls used blogs to delineate "safe" spaces for self-expression and community, but were also challenged by maintaining a consistent sense of self across a variety of friends, family, and other publics that presented possible readers of their blogs. Further studies indicate that bloggers tend to write for friends and family, thus using blogs and similar media that afford "the public performance of personal thoughts" to enhance existing relationships (Stefanone & Jang, 2008; Stefanone & Lackaff, 2009, p. 964). Some have characterized blogging content as "phatic," or emblematic of communication that has purely social and not informational or dialogic intents (Miller, 2008). Others find content to reflect individualistic patterns of sociability (Hodkinson, 2007), and emphasize immediacy, the subjective, and decentralization (Matheson, 2009). In this sense, blogging content sustains an ongoing project of the self, affording users opportunities for intimate communication in a mediated setting.

Self-disclosure on blogs has been connected to social support and improved social integration for bloggers, thus creating social capital on a personal level (Ko & Kuo, 2009). Blogging content is frequently characterized by verbal motifs of self-discovery and identity play (Blood, 2004; Gonzales & Hancock, 2008). Blogging language and tone will frequently be more experimental, playful, and relaxed (Ducate & Lomicka, 2008). In the context of blogging communities, however, ground rules, the presence of moderators, availability of profile information, net etiquette, and a variety of content-regulating practices will also shape the parameters of blogging content (Silva, Goel, & Mousavidin, 2008).

Blogs combine elements of personal media with the potentialities of mass media, thus indulging content produced privately and broadcast publicly under relatively deinstitutionalized settings. As a result, the hybrid rhetoric or vernacular of blogs is not defined by a single institutional structure but contains a variety of institutional references woven into discursive themes that blend personal priorities with mass aspirations. The following sections examine how representative blogging narratives may be.

Blogging and Representation

The prevailing hope with the release of blogging technology was that real-world inequalities would lessen, allowing all voices, races, and regions to have an equal chance for representation online (Ito, 2003; Lebkowsky & Ratcliffe, 2007). Unfortunately, this scenario has not come to fruition. Like existing inequalities in the real world, and similar to prior technologies that failed to redress race, gender, and class imbalances, Web 2.0 technologies have spawned their own levels of inequalities. The mechanisms that have led to the growth of power inequalities within the blogosphere prove difficult to surmount for many bloggers who find themselves in a similar minority position to their real-world status.

This inequality has been highlighted by blog aggregators such as Technorati and BlogPulse, who seek to provide snapshots of an ever-expanding blogosphere by highlighting the top 100 blogs across all genres and regions. This popular list, which has been around since the early twenty-first century, has led to the growth of an A-list group of influential bloggers who wield power on the agendas of traditional media and general web publics (Farrell & Drezner, 2007; Tremayne, 2004). These popular blogs, often focused on politics, technology, or entertainment, also seek to indicate their group memberships in relevant communities by linking to additional blogs in their blogroll lists. These blogroll links, which are semi-static, have further boosted the popularity of existing popular blogs since blog aggregators utilize counts of a blog's incoming links as a metric for determining blog popularity (Thompson, 2006). The mechanism that creates blog celebrity status fuels itself: newly created blogs, seeking attention, link to these already-popular blogs in an effort to receive validation from credible bloggers. This scenario, well described in social network science theory by the term preferential attachment (Barabási & Albert, 1999; Barabási, Albert, & Jeong, 2000), has made it difficult for less popular blogs to gain visibility among web publics and traditional mass media entities.

For a variety of reasons, existing real-world inequalities in terms of gender, race, and class were largely transferred to the US blogosphere during its early explosive growth, making women, minority bloggers, and lower socioeconomic classes disadvantaged as later entrants to the blogosphere. The well-documented criticism that the popular US blogosphere is largely White and male (Meraz, 2008) has also resulted

in a series of countermeasure strategies adopted by many of these invisible communities, who seek to raise their status and influence to the web publics interested in their content. Many of these countermeasures attest to the significance of free blogging technology, which may not whitewash inequalities but provides a platform for the articulation of the interests of niche, interest-based web publics. Blogging technology has enabled previously invisible web publics to highlight agendas of interest to their communities, and it is from this vantage point that blogging has served the varied purposes of underrepresented publics as it relates to race, class, and gender diversity.

Blogging and Race

Within academic discussions of the political blogosphere, little formal focus has been dedicated to the intersection of blogging and race. Few popular, minority-status political bloggers consciously push a race agenda. In terms of general genre popularity, blogging about race has failed to acquire popularity within the US blogosphere, as evidenced by blog aggregators like Technorati or BlogPulse, which show few to no political bloggers who highlight race issues within their top 100 listings. Similarly, since the creation of the Annual Weblog Awards in 2001 (a community-driven award system that collates Internet votes to determine the best weblogs by genre), there remains no category for minority blogging. Though blog awards exist for separate regions of the world, the lack of specific identification of blogging with race best illustrates the general belief that blogging is a neutral technology.

Minorities such as African Americans and Hispanics disproportionately represent the laggard adopters of the Internet and its associated technologies (Spooner, 2000, 2001). Though blog tools are free, it has long been noted that a user's Internet skill impacts his or her capacity to innovate with web technologies. As such, it is not surprising that these minorities are less likely to blog when compared with their White counterparts. Yet, though the popular bloggers are less likely to be a minority, bloggers in total are less likely to be White (60%) when compared to the general Internet audience (74%), with approximately 20% and 11% of bloggers identifying as Hispanic and African American respectively (Lenhart & Fox, 2006).

Little work has been done on the political uses of blogs among racial minorities outside the United States. In one of the few studies, Yao (2009) found that migrant Filipino women in Britain used the blog tool to connect with others of shared status in both online and offline contexts. Within the United States, of all minority groups, the political usage of the blog tool by Blacks has been most visible and documented. In a practical sense, Black bloggers have been alive to their marginalization within popular blog listings and within community-wide metrics that seek to reveal popular blogs. In an effort to circumvent their invisibility, Black bloggers have formed their own, alternative Black awards system, designed to highlight the interests and

achievements of Black bloggers. Highlighting bloggers from over 90 countries across 31 interest-based blog categories, the Black Weblogs Awards, since their creation in 2005, have drawn public attention from traditional media entities and web publics. Such political blogs as *Negrophile*, *The Field Negro*, *Jack and Jill Politics*, and *Postbourgie* have claimed the top political blog category over the recent years of this award's existence. It is undeniable that Black bloggers are creating conscious networks to make themselves visible to their audiences; for example, at the 2010 South by Southwest Interactive Conference in Austin, Texas (an annual US conference that highlights emerging technology trends and their consequences for politics, culture, and society), the first-ever panel on Black blogging titled *Black Blogging Rockstars* sought to address common issues that bloggers of color face in trying to make their blog relevant and successful to their web publics.

Very little work has been done regarding the motivations to blog among Black bloggers; however, findings from interviews reveal that Black bloggers share similar socioeconomic status to bloggers in other prominent communities (Pole, 2006). According to Pole (2006), Black bloggers are highly educated, with most having attained postgraduate education. In this study, Black bloggers confirmed that they place heightened significance on Black issues relevant to their community, though they do not seem constrained or limited to adopting a Black agenda. These bloggers saw their primary audiences as highly educated and Black, and they often use their sites to encourage their primarily male audience to participate more deeply in political activity.

Black blog communities also enact identity performance, enabling participatory web publics to affirm a sense of Black identity. In enabling a focused discussion of subject matter of importance to Black communities, such as AIDS, one study also found evidence of Black identity performance as witnessed through cultural and linguistic markers, which was utilized by Black audience members to provide social support and create a sense of shared, in-group identity (Kvansy & Igwe, 2008). Yet, the limitations of the blog tool in its capacity to support threaded, complex cross-conversation among conversational participants was evidenced in another study, suggesting that the technology remains somewhat limited in its capability to support a deeply focused discussion on highly charged racial issues (Brock, 2009).

Blogging and Class

The adoption of blogging technology over the years has followed a trajectory similar to that predicted by theories such as the diffusion of innovations. Since the development of blogging software in 1999, the earliest adopters of the technology were technophiles, highly political individuals, often male, highly educated, and of a higher socioeconomic class (Rainie, 2005; Sifry, 2005, 2006). Now over a decade old, blogs can be considered a mature technology as they now yield ground to newer, trendier web activities like microblogging and social networking sites.

Current statistics on the demographics of bloggers suggest that blogging remains a tool utilized by higher socioeconomic classes. According to Technorati's 2009 State of the Blogosphere report (McLean, 2009), 75% of bloggers have college degrees, 40% have graduate degrees, and 25% earn over \$100,000 annually. Like prior technologies open to interpretative usage, the blogosphere is also stratified by the skill base of its users. Though the majority of this college-educated crowd blog as a hobby (72%), 9% of bloggers are self-employed through their blog while 4% are professional bloggers for a company or organization. Bloggers who are self-employed or professional bloggers earn money through their blogging endeavors, with more than one-third of these bloggers earning over \$100,000 annually. A blogger's capacity to monetize his or her blog through attracting advertising is limited to only a small percentage of this already highly educated group of web publics.

It is possible that the blog tool's encouragement of longer-form writing may have created a gap in its adoption by the poor as a vehicle to publicize their political and social experiences. Oftentimes, the acute disempowerment of the lower socioeconomic classes is made visible during natural disasters when they most lack the voice to express their vulnerability; in such situations, their stories are left to be told through the eyes of the more powerful. During the 2005 US Hurricane Katrina crisis in New Orleans, tourists, traditional media, and popular bloggers used the blog tool for disaster response management as they sought to locate missing people through blogs and database tools (Meraz, 2006). Similarly, during the 2004 Asian tsunami crisis, wealthy tourists armed with hand-held video cameras captured the event in real time, posting videos to video blogs in their efforts to become the voice for the disempowered and poor. As Zuckerman (2004) noted in his work on deploying blogs in Africa, the tool's ready availability has not resulted in its steady uptake by the third world populations most capable of being helped by its democratic potential. Territories that lack broadband access and have lower Internet penetration may be unable to reap the promised benefits of blogging.

Clues that the longer, primarily textual form of blogging may have hindered its rapid adoption among less-educated and affluent populations are readily apparent. Less socioeconomic stratification has been witnessed with photo-blogging or blogging through photos, as evidenced by Flickr photosets of the Katrina crisis, the 2004 Asian tsunami, the 2007 London bombing event, and the 2009 Iranian protests. Mobile phones can capture photographs, and there is arguably less skill required to post photos to free photo-storage sites on the web like Flickr and Photobucket. Twitter, a nimble, microblogging application developed in 2006 that constrains written communication to 140-character status updates, was also readily adopted by citizens during such incidents as the 2009 Moldovan protests (Morozov, 2009; Telegraph, 2009) and the 2009 Iranian protests (Corley, 2009; Shachtman, 2009) as they sought to broadcast first-hand news accounts to an international audience. At the behest of the US government, Twitter (2009) rescheduled routine maintenance to ensure that the tool was kept functional for Iranian citizens to publicly relay their dissent during the most active period of broadcasting protests.

Blogging and Gender

Disagreement persists over gender inequity in blog tool usage. Like former technologies in the early stage of diffusion, between the years 1999 and 2005 men outstripped women in the adoption of blogging technology (Rainie, 2005). However, since 2006, many argue that women have achieved parity with men in the usage of the blog tool (Lenhart & Fox, 2006). Though some accounts continue to cite men as more predominant users (McLean, 2009), specifically in relation to political blogging (Seely, 2007), or as more credible writers than females (Armstrong & McAdams, 2009), what is clear is that women have blazed a trail in the usage of the blog tool for networking and empowerment in relation to both the domestic sphere and the political arena. As it relates to the younger generation, girls outstrip boys as content creators and in the usage of the blog tool for personal journaling and social connections (Davis, 2010; García-Gómez, 2009; Lenhart & Madden, 2005; Lenhart, Madden, Smith, & Macgill, 2007), making this generational change a fundamental shift in how genders adopt emerging Internet technologies.

As of 2010, it is more common to see women political bloggers as leading voices and sources on politics; for example, Arianna Huffington of the *Huffington Post* and Jane Hamsher of *FireDogLake* feature prominently in traditional media news reports. Outside the United States, women bloggers (Campbell & Kelly, 2009) and girl bloggers (Harris, 2008) are also increasingly adopting the blog tool to document their political experiences through a personal lens. However, even as late as 2007, women political bloggers were still outnumbered by men in the top 100 popular blog listings as generated by blog aggregator tools such as Technorati. Male bloggers have suggested that female bloggers are less interested in politics (Drum, 2005a, 2005b; Ratcliffe, 2005). Women bloggers accused male bloggers of insular and gender-homophilous linking practices (Harp & Tremayne, 2006; Meraz, 2008), a trend that they state had resulted in their subversion in blog aggregators, which total a blog's incoming links as a measure of credibility, reputation, and relevance. The academic wealth of literature locating differences in writing style between women and men (Argamon, Koppel, Pennebaker, & Schler, 2007; Babcock & Laschever, 2003; Coates, 1986; Gneezy, Niederle, & Rustichini, 2003; Tannen, 1993) was also advanced as an explanation for women's difficulty in gaining an audience within the often cut-throat, highly charged, opinionated atmosphere of the political blogosphere. This is in keeping with research that supports women bloggers' more likely embrace of the personal journal blog style when compared with male bloggers, who use blogs for filtering the web's long-tail information supply (Herring & Paolillo, 2006; Karlsson, 2007; Meraz, 2008; Pederson & Macafee, 2007). Blog studies conducted outside the United States suggest less gendered usages of the blog tool (Van Doom, van Zoonen, & Wyatt, 2007) when compared to the sharp, binary gender divides found within the United States. Similarly, women's blogging intentions appear to be strongly motivated by self-expression

compared to men's blogging intentions, which are typically influenced by general personal outcome expectations (Lu & Hsiao, 2009).

Since 2005, women bloggers have sought to network, in both face-to-face and online settings, in an effort to heighten their visibility and influence while providing a supportive gateway into the immense diversity of subjects of women's blogging efforts. BlogHer, created in 2005 from a face-to-face conference, is now host to thousands of women's blogs and is considered the premiere destination for locating women's blogs. In 2006, BlogHer formed an advertising network in an effort to connect women bloggers to eager marketers who continued to take note that women are the chief online purchasers for their family (Hogue, 2009). BlogHer's political influence has been visible in its attainment of credentials to cover the 2008 US Democratic National Convention in Denver, and in its invitation in 2009 by the US White House to debrief leaders on the significance of women online as a social network. Women currently outnumber men in usage of social networking sites (Taylor, 2009), and BlogHer represents a growing trend of female-only Internet spaces geared toward social connections among women, similar to other web destinations like CafeMom, iVillage, Glam, ParentsConnect, and Kaboose.

These formal organizational spaces may have given women bloggers growing confidence to document subject matter once considered the sole preserve of the private sphere. The phenomenon of sex blogging is practiced by women who seek to reassert control over the knowledge and narratives of female sexuality (Ann Wood, 2008; Attwood, 2009). Another significant trend is the phenomenon of mommyblogging (Lopez, 2009; Meraz, 2008). Mommybloggers seek to tell genuine stories of motherhood as opposed to the glamorized portrayal of mothers as presented on magazine covers. On a day-to-day basis, mommybloggers who embrace all forms of work-life balance populate their blogs with real-life accounts of such issues as postpartum depression, infertility, and frustration in juggling multiple roles as wife, mother, and worker. Prominent mommybloggers such as Heather Armstrong (Dooce.com), Ree Drummond (The Pioneer Woman), Alice Bradley (Flinslippy), and Stephanie Nielsen (Nie Nie Dialogues) have gained celebrity status among female audiences online, with some supporting their families from their blogs' monetization. In 2008, the power of mommybloggers as a social network was evidenced in their backlash against the company Motrin for portraying moms who wear their babies in slings as crazy and overly fashion-conscious (Petrecca, 2008). The hashtag #motrinmoms became a trending topic on Twitter, and the company Motrin was eventually forced to deliver a public apology to these mothers on the web. In the realm of politics, women and girl bloggers are also using the blog tool to document their political experiences outside the US context (Harris, 2008).

Though some high-profile women bloggers deplore the creation of separate women-only Internet spaces as an effective countermeasure strategy against male patriarchy in the blogosphere (Powers, 2004), women bloggers have used these spaces to elevate the public profile of issues once relegated to the lifestyle sections of newspapers (Harp, 2007; Poindexter, Meraz, & Schmitz-Weiss, 2008). Women bloggers'

public refusal to dismiss gender inequity in the blogosphere has resulted in conscious, gender-homophilous networking for political and social purpose.

Future Trends

Trends in the content of blogging affirm its character as a public space, not a public sphere, dedicated to ideas, persons, and publics eluding the reach of mainstream media. Combining personal and mass media affordances, blogs blur agendas personal, private, and public, producing perspectives that are subjective and unique. The ensuing multiplicity of voices that fills the civic landscape promotes “dissensus” over consensus, thus “bringing to the floor what forces attempt to keep concealed” (Mouffe, quoted in Carpentier & Cammaerts, 2006, pp. 973–974). The civic effect is one of pluralization, though not of inherent democratization. Mouffe (2000) terms similar attempts *agonistic*, thus describing the character of expressions that are suggestive of plurality and conflict and lie at the heart of *the political*. Agonistic actions can have both emancipatory and destructive consequences for democratic publics, but they always succeed in promoting a somewhat anarchically driven model of disagreement that favors pluralism. Mouffe uses the concept to expose the paradox inherent in contemporary democracies that require a homogeneous public sphere at the expense of heterogeneous pluralism. As a result, the expressive autonomy of citizens is compromised for the sake of argumentative consensus. Blogs reinstate expressive autonomy to ordinary citizens, who function as agonists of contemporary democracies, pluralizing but not necessarily creating or promoting democracy. Unlike Mouffe’s dissenters, bloggers are agonists of both *the personal* and *the political*. The personal becomes political, and the political remains personal, as this genre traverses and rarely distinguishes the two.

Within this plurality, there is undeniable inequality, fueled by the usage of the blog tool among a web public that is diverse in skill and interest. The utopian notion that the blog tool would transform media economics from its blockbuster, hit-driven culture of elites to a more egalitarian system of niche platforms that command smaller audiences (Anderson, 2008) has not been realized to the degree formerly perceived. True to other large-scale web networks built on Web 2.0 technologies (Hindman, Tsioutsoulis, & Johnson, 2003; Kittur & Kraut, 2008; Kittur, Suh, Pendleton, & Chi, 2007), the blogosphere is a system dominated by a few users. These celebrity blogs that command an inordinate degree of attention in the long-tail media supply have the capability to set the agenda both within the blogosphere and outside to the traditional media entities that once viewed this citizen media platform with suspicion and derision.

As blogs evolve, so do their political functions. The blog format, once celebrated for its promotion of individualism, is now utilized with the intention of maximizing network effects in both audience size and advertising dollars. Political blogs increasingly

resemble traditional media newsrooms through their embrace of team blogging and editorial workflow practices similar to the traditional entities they once served to supplement or critique (Stoller, 2007). Persistent, successful blogging remains a dedicated practice of the higher-educated, higher-income, more politically interested segment of the web public. This trend is set to continue as traditional newsrooms downsize in an effort to remain profitable in a twenty-first-century media climate that no longer enables these entities to realize economic gains through constraining media supply (Project for Excellence in Journalism, 2010). As big media bloggers join the blogosphere, and former journalists join political blogs like *Politico* and the *Daily Beast*, the US political blogosphere is being transformed from its early identification with the “pajama-clad” amateur to a climate where institutional attachments offer decided advantages to blogger independence.

Blogging, now arguably a mature technology, can be viewed in retrospect as part of the first generation of participatory Web 2.0 tools, which, though revolutionary for their time, eventually yield to tools that continue to advance our understanding of what it means to express sociality online. Blog technology, originally designed for promoting self-expression and easy web content creation, was significant in its consequence, shifting the read-only web to a read-write web for those users who lacked the technical skill to make the web responsive to their individual content-creation acts. The more participatory web public, now accustomed to the ease of uploading text, audio, and video to the web, has come to demand and expect new functionality from emerging toolkits. The blog platform, highly responsive to individual and group expression, was arguably primitive in its capacity to support community, conversation, or collaboration through its infrastructure of comment streams, trackbacks, and linking.

Applications that support immediacy and rapid, real-time updates are eroding the popularity of blogging among those networked publics that primarily desire to forge community and encourage conversation. These networked publics, not solely driven by the desire to broadcast information, are shifting to status-update platforms, or micro-media applications like Twitter and social networking sites, which encourage continuous information flow in smaller-sized increments. In the words of Edelman PR blogger Steve Rubel (2009), the blogosphere is “like a singles tennis player who focuses solely on the baseline game, logging long balls back and forth,” in comparison to applications like Twitter, which encourage “playing doubles – and at the net all the time.” Some of these newer Web 2.0 applications like Foursquare and Gowalla include location-based features, enabling hyperconnectivity at the local level with other users who share geography and/or interest.

Whether these emerging Web 2.0 tools are viewed as a natural progression of blogging or as a replacement to blogging, what is certain is that blogging as a web activity will attract a smaller percentage of the web population as choices expand to support more specific, localized activity. To date, blogging remains the prime tool for longer-form expression, and its usage will continue to impact the political, cultural, and economic landscape of the Internet along with emerging platforms that further our capacity for connectivity and sociality.

Videogame Content

Game, Text, or Something Else?

Mia Consalvo

ABSTRACT

This chapter surveys the most recent scholarly work done on videogame content. It identifies several lines of research that have emerged in this area, including debates over the best methods for studying game content, representation-based versus gameplay-based approaches, and theoretical foundations for studying games. In addition to providing a broad overview of recent work in such areas, the essay also provides a more detailed account of how such research works, through an examination of the author's past videogame studies. These include studies that have examined titles such as *The Sims* and *Phoenix Wright: Ace Attorney*, among other examples. These studies demonstrate how theory may and may not be useful in studying games, how methods must be adapted to best scrutinize dynamic content, and the many meanings that can be taken from contemporary games. The essay ends with a discussion of how future research on games should proceed, and the identification of the areas most pressing in terms of investigation.

What does it mean to study a videogame, without asking players how or why they play? If we study videogames, is the meaning in the representations the game offers us, in its narrative or story, in the gameplay we enact, or in some combination of those? And if we can agree on where the “meaning” resides, how do we go about

The International Encyclopedia of Media Studies, First Edition.

figuring out that meaning? This chapter is an exploration of past and current studies of videogame content. It explores what scholars have said in relation to games and their meaning, but it also discusses the various methods those scholars have used, including their challenges and limitations. It does so in order to explore the particularities of studying games – to give the reader a better sense of the history of videogame content, but also a better understanding of how that content was found, and how one might go about conducting one’s own study. It raises some questions for the reader to consider, and also points to areas that need further attention from scholars of videogames. It does so by reviewing what has been done so far, discussing the limitations of various approaches, and offering two case studies of how an analysis of game content could look. Overall, though, it should leave the reader with one central question to consider: How do games make meaning, and how can we go about finding the meanings that arise when people play videogames?

Analyzing Videogame Content

Studies of videogame content have been conducted since at least the 1980s, as researchers have tried to understand the images, actions, and themes prevalent in games as they progressed over time. A little-known study from 1985 (cited in Provenzo, 1991) helped establish a baseline for later research, finding that “in a sample of 100 video arcade games, [researcher Terri] Toles determined that 92 percent of the games did not include any female roles, and that of the remaining 8 percent of the games, 6 percent had females assuming ‘damsel in distress’ roles and 2 percent in active roles. [...] in the case of the two females who do take active roles, neither is a human – one being a Mama Kangaroo attempting to retrieve her child and the second a feminized blob, Ms. Pac Man” (Provenzo, 1991, p. 61).

Two better-known books on the topic, both released in 1991, provided additional overviews of content in games and helped set the agenda for future research programs. Eugene Provenzo’s *Video Kids: Making Sense of Nintendo* (1991) was an analysis of popular Nintendo games for the NES system. To study the games, Provenzo utilized multiple methods: analyzing the 10 most popular games of the time according to *Nintendo Power* magazine; reviewing their instruction manuals; and looking at advertising and reviews for those games. Additionally he conducted a content analysis of the box covers of another 47 games, as well as employing surveys and open-ended interviews with young game players. Provenzo (1991) found that in most games he studied, “violence and aggression [...] become the only viable operative principle by which the player can function. They become a substitute for personal reflection and contextual judgment” (p. 127). Furthermore, “gender bias and stereotyping are evident throughout the games included in the Nintendo system” (p. 100).

Marsha Kinder provided a somewhat more sympathetic reading of Nintendo games in her own book, *Playing with Power in Movies, Television and Video Games*

(1991), exploring the links between various popular entertainment options for children, including cartoons, videogames, movies, and television. Using a psychoanalytic framework, Kinder argued that while gender stereotypes were indeed present in games, the games could also have a beneficial effect on the relations between fathers and sons, such that “the games can help boys deal with their rebellious anger against patriarchal authority” (1991, p. 104). Such studies by Provenzo and Kinder were meant to provoke parents and potential researchers interested in media to consider the possible long-term as well as short-term effects of game images and gameplay on youth. Perhaps foreshadowing the rise of the serious games movement a decade later, Provenzo argued: “games become powerful teaching machines and instruments of cultural transmission” (1991, p. 75).

Content Analyses of Games

As games continued to flourish and expand in complexity – both in terms of graphical realism and in the scope of what was technically possible for gameplay – researchers continued to concentrate on a few areas of content, most notably how gender and gender roles were represented in games. Thus, much research that shaped the field and perceived knowledge of videogame content concentrated on how male and female characters were portrayed in games, and, for female characters, how often (if at all) they appeared, and in what sorts of roles. In their findings, researchers from the 1990s and early 2000s found a fairly consistent picture of those characters. For example, in one of the most widely cited studies of the time, Dietz (1998) found that there were no female characters in over 40% of the games she sampled, and when women were present, they were generally portrayed as the “damsel in distress” or were sexualized via their appearance or clothing. Beasley and Collins-Standley (2002) similarly found that females were absent from the majority of the 47 randomly selected games they analyzed, and there was a significant sex bias in how male and female characters were portrayed.

Researchers continuing to study gender and sexual representations in games have generated consistent findings since those early studies. In 2009 Downs and Smith analyzed videogame characters in 60 top-selling games, again finding that female characters were underrepresented, and those that did appear were significantly more likely to be shown as partially nude, wearing sexually revealing clothing, and possessing an unrealistic body image. Following that, in 2007 Jansz and Martis studied the introductory movies in a non-random sample of a dozen popular games, finding again that female characters were portrayed as hypersexualized and as sex objects, albeit with a few in leadership roles.

Taking a broader approach than just gender, the Children Now group (2001) commissioned a study that examined the 10 top-selling games created for each of the six videogame consoles available in the United States at the time (Dreamcast, Game Boy Advance, Game Boy Color, Nintendo 64, Playstation and Playstation 2) as well as

games for personal computers. The researchers conducted a macro-level analysis examining game characteristics such as genre, rating, game elements, and levels of sexual and violent content, as well as a micro-level analysis that “identified each unique character and examined such characteristics as gender, race, role and the character’s ability to commit and be a victim of violence” (2001, p. 28). The study reported similar findings with past research: violence was a predominant feature, with 89% of games featuring some sort of violence; and with no punishment for killing in any games, and the killing by player-controlled characters being almost always justified. With regards to gender, males continued to dominate in terms of both total characters in the sample and being 73% of player-controlled characters. Female characters again behaved in stereotypical ways and were often hypersexualized. In some of the first findings concerning race, the study found that more than half of all human characters were White, with Latino/a characters being nonexistent and Native Americans “essentially invisible” (2001, p. 22). The most usual site of diversity was sports games, but even in that genre portrayals were problematic, as “African Americans were most likely to display aggressive behaviors” compared to characters of other races (2001, p. 23).

Content analyses of gameplay content have continued, as researchers attempt to determine macro trends across larger numbers of games. One of the more recent such projects obtained sales data from NPD and analyzed the 150 top-selling games (from March 2005 to February 2006) across nine platforms, with the results weighted according to actual game sales (Williams, Martins, Consalvo, & Ivory, 2009). The researchers looked for representations of gender, race, age, primary versus secondary character status, as well as game rating and console specifications. The results were remarkably consistent with past findings: there was a “systematic over-representation of males, whites and adults, and a systematic under-representation of females, Hispanics, Native Americans, children and the elderly” (2009, p. 815). More specifically, “Hispanics and Native Americans did not appear as a primary character in any game, they existed solely as secondary characters” (2009, p. 825). Furthermore, the study found that only 10.45% of primary characters (those that drive the action) were female – suggesting a decline in the number of playable female characters in games over the past several years – the Children Now (2001) study had identified 27% of playable characters as female. There are two potential explanations for that shift – one is that the number of female playable characters has actually declined over time (a downward trend of more than 16%); the second is that the Williams et al. study is a more accurate accounting of female primary characters as it takes account of game sales rather than simple percentages of game characters. Thus, the actual number of female playable characters may have remained constant, but the new study weighted findings in terms of the games that individuals actually played. More such studies will be needed to determine the better answer.

Researchers have also explored the content surrounding videogames, such as ads for games in magazines, and the cover art on videogame boxes. Those sources have generated similar findings, demonstrating that ads and box art often feature scantily

clad female characters and male heroes that are aggressive and central to the story (Burgess, Stermer, & Burgess, 2007; Dill & Thill, 2007). Interestingly, such images have become so standardized that some companies have used such images to promote games that have nothing to do with the images depicted. The company Evony, developers of the online strategy game *Evony: Age II*, used suggestive images of scantily clad women to advertise its game, leading to complaints about the truthfulness of its advertising (Johnson, 2009).

Qualitative Analyses of Games

Qualitative researchers have also studied the content of videogames, although of necessity they usually limit themselves to smaller samples, sometime focusing on a specific game or series. One of the most analyzed series has been the *Tomb Raider* franchise featuring Lara Croft. A female version of Indiana Jones, Croft explores distant lands in order to find treasures as well as fend off the competition and hostile locals – whether animals or humans (Kennedy, 2002; Mikula, 2003; Schleiner, 1998). Other gender researchers have focused on games featuring the television heroine of *Buffy the Vampire Slayer* (Krzywinska, 2003; Labre & Duke, 2004). Much of this type of work pays attention to the sexualization of the central female character, but also spends time analyzing the gameplay of the various titles, going beyond findings of violence to explore how powerful female figures might be meaningful for female players in their abilities to shape and control the worlds around them.

Most of this past work on content has focused on visual representations in videogames, along with discussion of gameplay mechanics as they also relate to content. This has formed the bulk of analysis, although newer approaches are emerging. For example, Jorgensen (2007) has done important work studying sound in games, exploring how it contributes to narrative and world building, and how it can be key to successful gameplay. While sound was originally quite primitive in early games (usually relying on MIDI files), more recent games feature orchestral scores, popular musical artists, voice acting, and complex audio cues. We need much more study of sound in games, and how it contributes to our experiences of playing.

Another key area for study is the space of games – both in terms of the spatial narratives being constructed and analyses of how space itself is constructed in games. So far, Aarseth (2009) has explored the world of *Azeroth*, arguing that while promotional rhetoric for *World of Warcraft* (WoW) emphasizes a large world ready for exploring, in actuality the geographical space of *Azeroth* is quite small, in order to better facilitate player and avatar movement through the world, as well as to keep terrain varied enough to hold player interest. In a broader study of space, Nitsche (2008) explores the architecture as well as player use of game spaces, concluding “game spaces have become part of our cultural spheres” but that “the cultural significance of a game space is instantiated by localized player activity” (p. 244).

Limitations of Past Approaches

While larger quantitative studies (usually content analyses of top-selling titles) can give us a broad picture of what images appear in games, those findings are limited by a few factors. First, in order to cover such a large number of titles, exhaustive play is sacrificed for breadth. Most often, game titles that are “analyzed” are not studied in any depth – either one introductory level is played, or the introductory movie is studied, or the first 10–30 minutes of the game are recorded and then analyzed. There is no way to know for sure if these time frames or excerpts are truly representative of the games played, as there is rarely material taken from the various games’ mid-points or endings for additional analyses. Thus it’s important to remember that not all of the game content has been studied, and the characters and events that appear later in the games will most likely not be included in the analysis.

In contrast, qualitative studies can provide the depth and detailed level of analysis that larger-scale studies cannot, but must limit themselves to making claims about a single title, or perhaps a series of titles. Such studies also tend to take gameplay into account in more subtle ways than content analyses can provide – often providing meaningful distinctions between different kinds of player actions, for example, as well as game genre conventions that can make a large difference in how players perceive particular games. For example, Carr (2003) points out how both *Planescape Torment* and the *Silent Hill* series of games use a horror theme along with a similar model of spatial navigation to drive player action. But particular gameplay mechanics make the experience of playing those games very different: while *Planescape Torment* “refuses to be hurried, the nerve-wracking *Silent Hill* urges the player from point to point, puzzle to solution, and onwards to a resolution. [...] *Silent Hill* [...] wants to frighten its players.”

Another challenge for analyzing videogame content is the constantly changing nature of the technologies and platforms available for games, which can profoundly shape the scope of the visuals, the audio, potential interactions with non-playable characters, as well as gameplay mechanics themselves. Thus, studying the first *Final Fantasy* game on the NES system is quite different from examining *Final Fantasy XIII* on Sony’s Playstation 3. In addition to having graphics that are magnitudes of order more sophisticated, the games themselves are quite different – there is a full audio score and voice acting to consider in the latest version, and enemies in *Final Fantasy XIII* will react in more sophisticated ways than in the original game. There are more hidden objects and events to uncover, as well as mini-games and references to past game objects. Thus to be able to speak with any certainty even about one series of games – the *Final Fantasy* franchise – a researcher must keep studying each new release.

Related to the technological developments just mentioned, games have also grown in complexity in another area – branching paths, or multiple storylines or endings. Some games, such as *The Sims*, actually do not have endings and thus have multiple

pathways that the player can decide are successful or failures, but increasingly even games with a linear progression offer multiple solutions to various challenges, as well as a multitude of endings, in order to increase the replayability of the game in question.

That broadening of content has interested as well as vexed game studies researchers, who question just how much of a game must be played in order to fully understand and critique it. While not as much of an issue with content analyses that focus on the first few minutes of a game, for qualitative researchers intent on completing a game to study it, the question becomes: What does it mean to complete a game? Is it only to play through once to the end? But what if there are multiple endings or pathways to one or more endings? Game researchers must ask themselves what they are trying to achieve with their analysis – if they wish to understand the game in its totality, then they must indeed play through as many elements and options in the game as possible. This may demand dozens of hours of play, just for a single title.

Likewise, game researchers have questioned how much of their own effort must go into that gameplay. Scholars have debated whether or not it is acceptable to cheat in a game in order to reach certain content (Aarseth, 2003; Kucklich, 2007), or simply to cheat in order to gain the knowledge of how that particular action (or set of actions, if the game is complex) might impact gameplay. Thus, it might be one thing to use a cheat code to advance to a certain level in a game if one has already played through the game once, to then explore other avenues or choices offered in the game. And it might be another issue if the researcher chooses to engage in griefing¹ a multiplayer game, in order to see how the game proceeds, and how other players react to that deviance (Myers, 2009). These are questions that must be considered when doing any in-depth analysis of a game, as they can impact in fundamental ways how the researcher plays the game, what her resulting experience is thus like, and then what the analysis itself is focused on.

Some other challenges for doing analyses of game content can relate to issues of access – if researchers want to study a wide range of games across various consoles, they must have access to those consoles, as well as the games themselves. With new console and PC game prices at approximately US\$60, that can mean a sizable investment in a set of games. While the number of contemporary consoles has now shrunk a bit from past numbers (Playstation 3, Wii, Xbox 360), there are still handhelds (PSP, 3DS, DSi) to consider along with entirely new platforms for games, such as different mobile phone platforms (the iPhone, Blackberry, Palm OS, and Google's Android open source platform), Flash games, Shockwave games, SNS games (on sites such as Facebook and MySpace) as well as browser-based online games and downloadable games. Some games appear across multiple platforms, forcing researchers to question which version of a game to use for analysis, or to include all versions in a study. There are also games that have appeared using Twitter as a platform, and ARGs and mobility-centered games that can cross platforms or use non-electronic platforms entirely. Thus platform is a consideration that continues to be relevant in studying game content.

Finally, although game publishers have always had global releases of games, they are increasingly attempting to simultaneously ship localized versions of the games they create. Games can be released in one locale only, in a few selected regions, or in many languages across multiple countries and regions. While some games may have only minor modifications across those areas, other games, such as those in the *Phoenix Wright* series, are subject to extensive modification. While one researcher may not be interested in how games shift in content as they cross international borders, others might find that to be their primary area of interest. Thus, having access to various international versions of games, systems to run them, and the language and cultural abilities to interpret them, might also be necessary for gaining a fuller understanding of a game's content.

Case Study I: *The Sims* and Queerness

As a way of understanding some of the challenges associated with studying game content, I'd like to discuss my experiences with analyzing the computer game *The Sims* and several of its add-on expansion packs. I started the study intent on exploring how the game represented sexuality – in prior playthroughs of the game I was struck with how open the system was to allowing the creation of heterosexual, gay, and lesbian Sims (Consalvo, 2002). Thus I set about exploring in a more systematic way how the affordances and constraints of the game influence the ways players could enact sexuality (if not queerness itself) in *The Sims*.

The Sims is the bestselling PC game of all time – it (“it” includes its many iterations: *The Sims*, *The Sims 2*, *The Sims 3*, console and handheld versions, expansion packs, and the ill-fated online version, *The Sims Online*) has sold more than 125 million copies globally, has been translated into more than 22 languages, and is available in more than 60 countries. It is most often described as a type of digital dollhouse, with players given the option to create multiple Sims, Sim households, to control and direct their lives, as well as the ability to create and modify game elements that players can then share with others, and to use the game as a platform for storytelling.

One of the immediate challenges such a game presents, aside from whether to even consider it a game, is its open-endedness. This is not a game like *Dream Chronicles* or *Dragon Age*, with a discernible endpoint, unambiguous goals, and (relatively) straightforward challenges for the player. Instead, the game allows the player to create challenges for herself, whether they are to successfully raise a Sim family, or to creatively kill Sims; to build mansions; to tell soap opera-like stories; to create fashions and objects to enhance the Sim universe; or to create challenges such as the “homeless Sim” challenge that was famously chronicled on a blog (Burkinshaw, 2009).

In approaching the game, the question of exactly how to analyze content became a central concern for me. There was no overarching storyline in *The Sims*, and game-play options seemed to be multiple and varied – perhaps varying greatly from player

to player. At the time there were few models for doing any sort of game analysis, and more traditional forms of textual analysis relied on narrative structures that didn't seem present.

Thus to get a sense of the game and its approach to sexuality, I devised my own methods for study. First, I simply played the game. I created multiple households, consisting of a variety of Sim configurations. There were traditional families, groups of friends, gay and lesbian couples (with and without children), as well as individuals living alone. I assigned them multiple goals, including career advancement, romance, being social, accumulating wealth, and creating or advancing families. They acquired money and greater resources, while some of them were purposeful failures. I purchased and had them use as many objects as possible, to see what options they could or could not employ with them. They also were social (and occasionally antisocial) to see what friendships, romances, and enemies would result.

After doing all of this, I created a systematic approach to mapping the game, which drew from activities and elements I observed during gameplay, and which I thought could be used by other game researchers as a way to systematically approach the study of games (Consalvo & Dutton, 2006). First, I created an inventory database for all objects I employed in the game. That included non-interactive as well as interactive objects. Objects were catalogued according to cost, interactivity, what types of interact options the object offered (sit, nap, eat, sleep in, etc.), and how those options changed according to particular variables, including how many Sims could use the object, the mood and relationship status of the Sims using the object, as well as whether or not users were children and/or adults. Thus, I could differentiate the significance of the "love tub," which would only allow adult Sims to embrace in it, from less interactive objects such as plants and chairs.

Next, I analyzed the interface of the game, which was defined as "any on-screen information that provides the player with information concerning the life, health, location or status of the character(s), as well as battle or action menus, nested menus that control options such as advancement grids or weapon selections, or additional screens that give the player more control over manipulating elements of gameplay" (Consalvo & Dutton, 2006). Of particular note with *The Sims* is the Sim creation screen. While players are given the option to choose Sim gender, shade, age (child or adult), and appearance, there is no check-off box or choice given for sexuality. Yet Sims can be sexual in the game, in ways the players wish them to be. Thus the game does not force such options onto players but allows sexuality to be expressed (or not) as a form of activity chosen by players, rather than a fixed part of identity.

The next piece analyzed was larger and more dynamic – mapping interactions within the game. While Sims themselves speak Simlish (which is gibberish to humans), they are able to engage in actions with other Sims, and it is important to see what sorts of interactions are available to them; this can vary based on their relationship with the other Sims, their personality, their age, and their mood. Thus I could study how the interaction options changed for two Sims as they moved from being strangers to acquaintances, then friends and perhaps either lovers or a married

couple with children. I could also contrast those options with Sims that were enemies, or how interaction options differed between two child Sims versus two adult Sims.

Lastly, I explored the gameplay itself, perhaps the most open-ended of my categories. While this area could be quite different depending on the type of game chosen, here I looked for elements such as emergent behavior, avatar presentation, and the overall look and feel of the game world. With *The Sims*, one of the more interesting elements of emergence occurred when Sims would engage in social interactions that their owners did not intend – so a gay Sim (as constructed by the player) might start flirting with a female Sim, or in the case of Robin Burkinshaw's (2009) Homeless Sim challenge, when the daughter Alice finally received a paycheck for her first job, she indicated that she wished to donate the money to charity, even though she herself still slept on the streets.

Overall, these four components can give researchers a more systematic way to study videogame content. However, it is important to recognize that these elements are not equally important in all games; thus, a game with few if any inventory items will have a much smaller Object Inventory to analyze, while a game with detailed and rich dialogue will require a much greater investment in mapping that interaction. We will also likely see the development of greater refinements to these tools as games and their genres become more specialized – we already need something more focused for studying Massively Multiplayer Online Games (MMOGs). Yet this study does provide one guide, and also indicates the multiple levels of complexity involved when a researcher wishes to study videogame content.

More Recent Work

One of the more systematic attempts to gather a collection of deep game analyses is the edited volume *Well Played* (Davidson, 2009). Contributions come from a variety of sources, including game scholars from different disciplines as well as professional game designers. Many of the pieces are descriptive of games, discussing their narratives and gameplay mechanics and what makes these games “good” in some way. For example, Noah Falstein's (2009) discussion of the turn-based strategy game *Advance Wars* is an excellent analysis of the gameplay system implemented by the designers, and he talks at great length about how the game is an almost perfectly balanced system of opposing and defending military units. Yet such pieces don't really tell us much more about the game's larger meanings, or how they might compare with other similar games.

Other game designers take a more ambitious approach, such as Nick Fortugno's (2009) study of the action-adventure title *Shadow of the Colossus*. Again we find a discussion of the story and mechanics, but Fortugno is also intent on demonstrating how the game's story and gameplay elements work together to create a game that models tragedy successfully. And Fortugno is also successful in his own argument,

showing how the game creates a sense of futility in the player's actions in elegant ways. He writes about how the game exploits a player's sense of what a game normally expects (follow a game's direction to kill specified monsters), by revealing through the monsters' actions and the game's ending how that did not help the player fulfill the larger goal of rescuing a lover from danger.

Game scholars also explore specific games in depth, including Isbister's (2009) personal account of her delight playing *Parappa the Rappa*, Squire, Durga, and Devane's (2009) discussion of a multiplayer session of *Civilization*, and Gee's (2009) account of his time trying to be the "best Solid Snake" he could be in *Metal Gear Solid 4*. One of the more detailed and theoretically informed studies is Rusch's (2009) analysis of *Silent Hill 2*. She carefully demonstrates how the game's storyline and its gameplay work in tandem to model the process of psychotherapy. She explains that the game is similar to the therapeutic process in that "therapy can be understood in terms of a journey with the obstacles in the way – be they mere roadblocks, lock and key puzzles, or monsters – representing mental or emotional blockages that have to be overcome in order to find the source of the trauma" (2009, p. 252).

Likewise, Fernandez-Vara explores *The Secret of Monkey Island*, particularly how puzzles are central to the game's design. She argues "puzzles in videogames should help us know more about the gameworld, the fictional world where the game is taking place. [...] puzzle solving reveals that Melee Island is becoming a tourist attraction of sorts – since the pirates cannot make a profit from their usual trade, they make a living out of aspiring pirates, who will pay for lessons in swordfighting. The 'treasure' that Guybrush digs up is a t-shirt, and he gets another t-shirt when he defeats the Sword Master as proof of his accomplishment" (2009b, p. 346).

Such approaches show how three elements are needed to deeply analyze a game – an understanding of surface representations, usually involving the story or narrative; an accounting of the game's mechanics and how those also help shape the experience of play; and finally the usefulness of theory in allowing the analysis to make broader claims about a game's relationship with culture. Without theory, the analysis can feel more like a description or a review – it's unbounded from the larger conversation about culture, and cannot contribute. Good analyses using theory show how games connect with other forms of media, other aspects of culture, and how they are evolving our understandings of complicated concepts such as gender, identity, exploration, and failure, to name just a few.

The Case of MMOGs

Analyzing single-player or offline multiplayer games can be difficult enough, but there is a special challenge in studying the content of online multiplayer games – particularly virtual world spaces such as MMOGs. Much of the research on such spaces has focused on the players and how they interact with one another and with the game worlds (Boellstorff, 2008; Dibbell, 2006; Taylor, 2006). Yet there has

been some work studying the worlds and content found in MMOGs, detailing such elements as gendered representation of avatars (Corneliussen, 2009), raced images (Higgin, 2009; Nakamura, 2009), the content of quests (Walker-Rettberg, 2009), the corporate structure of activities that the games demand (Rettberg, 2009), how death is constructed (Klastrup, 2009), fashion as aesthetic and gameplay element (Tosca & Klastrup, 2009), and the larger mythologies of the worlds themselves (Krzywinska, 2009).

One of the challenges of doing such research is that the meaning of an MMOG's content is shaped in large part by its players. MMOGs don't provide many ways for players to create much content (unlike a virtual world such as *Second Life*), apart from a few that allow the creation of add-on player modifications (mods) to the game's user interface (UI). But players form communities that come to value and interact with content in ways that can change the meanings of that content over time, and not always in ways that developers have expected or intended.

For example, Dutton (2009) investigated a particular player activity in *Lord of the Rings Online (LoTRO)* – studying those who wished to play female dwarves. In the fiction of the game (referred to as Lore), itself drawn from the larger canon of Tolkien's mythological franchise, female dwarves were seldom seen outside dwarf communities, leading to the assumption that all publicly encountered dwarves were male. And in *LoTRO*, the avatar choice for dwarf is just that – a singular choice – rather than the more normal male/female choice found with all other races in the game. While the option itself is unmarked (simply named “dwarf”), the images suggest the only option is a male dwarf. Yet some players have objected to that limitation, arguing for the ability to play a female dwarf.

While some have been content to lobby the developer (Turbine), others have taken matters into their own hands – actively creating “female” dwarves on their own. To do so, most choose the lightest skin option available, as well as options for the neatest and least facial hair offered (Dutton, 2009). Players also will use the varied clothing options in the MMOG to dress their avatars in either dresses or a feminine manner; and they also give their dwarves female-sounding names. Thus, they have reconfigured the content to serve their own interests and desires, rather than waiting for Turbine to (perhaps) listen to their protests and make appropriate changes (or not). While such activities are not particularly widespread, and there exists debate among players about whether or not such actions are appropriate, it does suggest the need to take player actions in MMOGs (if not all videogames) into account when studying content – as players themselves can be quite active in modifying (if not creating outright) what is considered central to such games.

Related to that, but more obviously focused on player-generated content, is research that studies mods to various videogames. While much research in relation to mods focuses on the motivations of modders as well as the value of their creations to the game industry (Postigo, 2007; Sotamaa, 2009), some research has also examined the creations themselves. Thus Sihvonen (2009) explored the world of mods for *The Sims*, analyzing the varying levels of player creativity in such creations, as well

as arguing for the need to look beyond traditional genres of study in this area – mainly first-person shooters and strategy games. She writes that such artifacts can both reinscribe dominant ideologies and challenge them. Additionally, her textual analysis of mods created by individual players shows us the partial truths and contested meanings that reside in mediated forms, as well as in the intentions of creators – both professional and amateur.

Such studies raise key questions about the study of user-generated content. While I will not go into further discussion of research that investigates such content, it is important to remember that such content can be of equal if not greater importance to players – particularly if games offer players tools or simply encourage the creation of elements such as objects, maps, artwork, or storylines that can generate significant meaning for those who encounter them. Players can also serve as co-creators of games, and their contributions are key to keep in mind when we think about the elements that comprise any game. Thus, understanding how content functions can be a moving target – one must usually explore the player community as well, to see how they are interpreting various content, how it is actually being used (or ignored), as well as how it changes over time.

Case Study II: *Phoenix Wright*

As mentioned earlier, one of the more enduring themes in the study of videogame content has been exploring the prevalence of gender stereotypes, which have been fairly easy to find across genres, years, and game platforms. One of the most hyped targets for study has been Lara Croft of the *Tomb Raider* series. Game scholars (as well as some game critics) have protested her unrealistic proportions. Critics also argue that rather than giving women the option to play as a hero of their own gender in a videogame, Croft mainly serves as eye candy for (straight) male players, a mannequin-like figure who doesn't talk back, nor even have any love interests in the games from which to detract from the player's alleged interest in her as a sexual object (Fantone, 2003).

Yet such critiques focus mainly on the *representation* of Lara, rather than her role as a tool for the player (as controllable avatar) to traverse the game's environmental challenges, argues game theorist Espen Aarseth (2004). In a protest against the "colonization" of game studies by those in film and media studies, Aarseth (2004) instead advocates for studying the ludic aspect of such games, writing, "the dimensions of Lara Croft's body, already analyzed to death by film theorists, are irrelevant to me as a player, because a different-looking body would not make me play differently. When I play, I don't even see her body, but see through it and past it."

But feminist (and other) game theorists argue that such a position is itself deeply gendered, with Aarseth's dismissal of the visual importance of Croft reinscribing "stereotypical gender formations where the 'hardcore,' abstract, formal, mathemati-

cal systems privileged by these approaches to games are masculinized while the ‘casual,’ material, visual content, and non-essential aspects of games are feminized” (Soderman, 2009). Moulthrop (2004) writes that “Lara Croft’s physique may consist of raw data but it cannot be treated as such for critical purposes. While one may look past or through the avatar body during play, the significance of games as cultural forms goes beyond the player’s time in the loop.”

Both Aarseth’s position and that of his critics have merit – representations in games do matter, but they are not the only aspects of content that can make meaning in a game. Clearly, gameplay and its affordances are central to understanding games, yet the challenge is how to convey that in doing actual game analysis. It cannot be an either/or proposition, with representations *or* gameplay being the sole focus of a study, if a researcher wishes to truly understand a game. But what would such an analysis look like? As a way to go beyond discussion of surface representations (without of course dismissing their importance), I’d like to talk about a game I have previously analyzed (Consalvo, 2009), the 2008 Nintendo DS title *Phoenix Wright: Ace Attorney*.

Phoenix Wright does not easily fit traditional game genre descriptions. As the title suggests, it lets the player assume the role of an attorney – more specifically, the new defense attorney Phoenix Wright – trying to prove various clients innocent of the charges against them. This occurs through investigation of crime scenes for clues and information and questioning potential witnesses, culminating in courtroom performances where the player as Phoenix must not only show her client is innocent, but also figure out (as well as prove) who actually committed the crime, ultimately forcing a confession from the real perpetrator. That’s the story, anyway, and there are interesting things that could be said about the visual representations the game offers, but more relevant here is the gameplay itself, and the way that it encourages the player to view evidence, as well as how to play the game.

Drawing from earlier work on *The Sims* and methodological tools for studying games as texts, we can examine objects and their particular role in the game as one way into that deeper analysis (Consalvo, 2002; Consalvo & Dutton, 2006). But rather than completing an exhaustive object inventory, however, it can also be instructive to determine how objects function in the logic of the game, especially in contrast with another key element of gameplay – interrogating witnesses. As I mentioned, the player can investigate crime scenes as part of the game, and will find (as well as receive) items that are key for later parts of the game. Some items are fairly mundane – crime reports, photographs, ID cards; others are specific to the scene, such as a spear used for a murder, or a clocklike statue used to hit someone on the head. Others appear useless at first glance, such as a trading card or a dinner plate with a steak on it, but these objects do have important uses. Thus, for example, a witness may not be willing to give testimony unless you bribe him or her with a particularly coveted object (such as that trading card), but the card was only obtained via another character, who gave it to you in exchange for something else, another mundane object you acquired in your investigation. Thus, objects can serve as a sort of currency in

the game – something not immediately obvious if one looks at the visual representations of the objects only, rather than both their appearance and their function in the game.

Objects are also key elements during the testimony parts of court trials. Witnesses often lie while on the stand (and have been instructed to do so by the prosecuting attorney), and their lies must be exposed through the judicious presentation of evidence to the contrary. But while individuals may lie or dissemble, evidence speaks for itself and is never shown to be false. Thus, objects have even greater currency in the game than spoken testimony, privileging evidence over speech as more valuable in getting to a successful verdict (and thus winning a game). Again, this is something that might not be evident if studying the surface representations of the game, or even analyzing the dialogue. Objects matter, greatly, but their successful use must be unlocked by the player.

Another way around the impasse of sticking with visuals is through recourse to performance theory, which questions the role of the body and movement in context-specific spaces. Videogame scholars have been slowly drawing from this approach, although most of it has been applied to how the player moves her avatar in the game space (Burrill, 2008), or exploring the relationship between a player and her avatar (Gee, 2003). Fernandez-Vara goes further, writing that if we consider videogames through performance theory, we can understand certain types of game activities as urging the player toward a “restoration of behavior” activity, such that “the pleasure of restoring behavior in adventure games such as *Myst* resides in discovering what the behavior is by exploring the world, identifying the problem and finding its solution” (2009a, p. 7).

Another helpful way to consider performance is through recourse to Judith Butler (1993). Originally writing about gender as a performance, Butler argues that gender and gendered identities are not static, natural parts of our selves. Instead we ourselves do the work of dynamically constructing our gender every day, with clear boundaries from contemporary culture about acceptable and unacceptable performances. Relative to gameplay, we can see how a game encourages individuals to play games in certain ways, rather than others.

For example, we can examine *Phoenix Wright's* courtroom system and the game's saving process for elaboration of this concept. In each episode of the game, the player gathers evidence and interrogates witnesses, with everything leading up to the courtroom trial, where Phoenix must challenge witnesses through presentation of the appropriate evidence at the correct time, in order to expose faults in their statements and thus bring about the exoneration of his client (thus winning the case). The game uses a kind of “penalty meter” that slowly subtracts “lives” when Phoenix acts incorrectly. If all lives are lost, the case is also lost, and the player must restart the courtroom scene from the beginning of that day. Playing the game does not require any manual dexterity or speed-related skills – it is all about the successful presentation of evidence and skillful interrogation of those on the stand. In that way, if the player keeps playing, trying every available option, eventually she will win the game.

So either through restarting a day's events over and over again, or in saving the game before each challenging moment, the player has the option of moving ahead slowly yet surely. But the game is about much more than trial and error. To truly play the game well and enjoy the experience, the game encourages the player to not save continually – to take risks and see the outcome. Saving is fairly easy, but to do so the player must quit out of the game and restart the system to reenter the scene. While not as cumbersome as doing so with a console, it still takes the player out of the flow of the game, as well as the experience of being in a tense courtroom, where the next step might make all the difference in exonerating or condemning your client.

Thus gameplay performance, via the player's specific choices and inputs, plays a central role in the setup of the game. The safer route is slower and removes the player from the fictional world, while the riskier route is more of a gamble, perhaps making it feel more like a real courtroom drama. Thus, the game enables different play styles for different players, through how they enact their own performances. This is something only an analysis of the gameplay could tell us, but is something central to understanding the game. So in actuality the fiction of the game (courtroom adventure) and the gameplay itself (countering testimony, playing it safe or going for broke) build on each other to reinforce the thematic core of the game. But we need an analysis of *both* the representations (here narrative) of the game and a study of its gameplay in order to make that determination. More game analyses are beginning to do this type of work, but it requires a deeper level of engagement than surface content analyses or basic genre determinants.

Conclusion

What is the future of studying game content, and what do we as researchers need to be focusing on? First, it would seem obvious, but the debate between narratology and ludology is over, if it ever really began. Both “sides” have made crucial points – that games can have important and intriguing stories and narratives within them, and also that games are more than simple representations. Gameplay must be considered an essential element to include in any game analysis. There is simply no way that one field or discipline can now lay claim to game studies, because we need multiple, varied approaches in our challenge to understand videogames.

We also need deeper studies of games that go beyond single titles, or broader content analyses that only look at snippets of games. An excellent example is Pinchbeck's (2009) study of multiple games within the first-person shooter (FPS) genre over the period of a decade. His examination of the interplay of gameplay and narrative in FPS games shows how a deep approach to studying content over time can yield more insightful understandings than work focusing on a singular game. His extensive study prompts him to conclude that “narrative and gameplay are really the same thing, atoms in a network with the same basic function: to describe an

experience and manage a player to deliver an appropriate set of inputs to a limited set of outputs” (2009, p. 264).

Additionally, Mosberg Iversen (2010) makes a compelling case that our frameworks for understanding games cannot be overly broad or abstract – that different types of games call for varying approaches. Thus, her work on computer role-playing games demonstrates that “games in the middle,” as she terms them, occupy a space where narrative and gameplay are equally important and thus should be studied that way, in contrast to games where either gameplay or fiction takes greater precedence, thus encouraging different ways to examine them.

While many studies of videogame content draw from theory to help us understand the meanings found in games, not all do so. Many content analyses, for example, make arguments about the potential impact of such content on players but do little to contextualize findings beyond that. In contrast, qualitative studies generally begin from theory, seeking to use it to understand what videogames have to offer to players. Both approaches are valid yet yield different conclusions. I believe using theory is important, but only in order to see how representations or actions might either reinforce what we already know or challenge traditional offerings. Theory also helps situate findings within a larger tradition. Content analyses can compare findings with past studies but offer little in the way of understanding why we are seeing what we do. Thus they are snapshots of a particular moment in time that might differ from past images, yet not do much more.

It might be best to end here, with the acknowledgment that even if we need more and better analyses of videogames, we shouldn’t work to develop global tools for those studies. Situated studies are generally preferable, taking account of the variability found in contemporary games. Thus while always taking into account elements such as visual representations and game mechanics, we also need to acknowledge how differences in genres, scale of games, multiplayer versus single player, player-created content and the like can make key impacts on our approaches, methods, and findings.

NOTE

- 1 Griefing is the act of purposely harassing, annoying, or otherwise disturbing other players.

Rethinking Violent Videogame Content

Conceptual Advances and Directions for Future Research

Kenneth A. Lachlan

ABSTRACT

Numerous empirical studies have attempted to quantify the frequency and context of violence in popular videogames. While these studies have proven valuable, they overlook recent research suggesting that videogame content is far more complicated than that found in linear media. In particular, individual user characteristics, varying levels of gameplay, familiarity with the gaming environment, and length of time immersed in the game have been overlooked. But research suggests that these factors will play a critical role in how players use and respond to videogame violence. This chapter synthesizes the videogame content literature with recent behavioral research. It concludes by offering an updated conceptual model of violent content that includes not only the game, but also user and situational variables that may mitigate this content. Suggestions for future content-analytic methods are discussed in light of this conceptual model.

Since the early 2000s, parents, academics, and policymakers have expressed consternation over the nature of violent videogames, voicing concerns regarding the potential for negative effects on both youth and adult game players. Empirical research exploring the content of videogames has suggested that videogames may be rife with

unsavory content. These included extensive graphic violence (Smith, Lachlan, & Tamborini, 2003), violence that is committed by primarily White male characters (Lachlan, Smith, & Tamborini, 2005), repeated use of gun violence (Smith et al., 2004), sexualized portrayals of female characters (Beasley & Standley, 2002), and verbal aggression and substance abuse (Haninger & Thompson, 2004). The findings concerning violent content have stirred perhaps the most public debate, leading critics to suggest a relationship between playing violent videogames and both short- and long-term aggressive behavior (Elmer-Dewitt, 1993). US news media have been quick to draw linkages between videogame play (as other controversial media) and high-profile school shootings at Columbine High School and Westside Middle School (Gegax, Adler, & Pedersen, 1998). A substantial corpus of research has established a link between playing violent gameplay and aggressive behavior (Anderson & Dill, 2000; Ballard & Lineberger, 1999; Sherry, 2001). At the same time, a smaller number of studies have sought to quantify violent game content by examining the frequency of violent interactions, the nature of violence, and the contexts surrounding this violence.

Methodological techniques used to explore behavioral responses to videogame exposure are fairly well established. Short-term responses in terms of aggressive attitudes and behaviors have been evaluated using experimental procedures that have been used confidently for decades by social sciences. Correlational studies establishing noncausal linkages have used well-established sampling and survey techniques, as have studies exploring the motivations and gratifications derived from videogame use. Meta-analytic studies concerning the effects of videogames, and violent games in particular, have also relied on tried and true methods of evaluating effects across programs of research.

However, we cannot logically have the same degree of confidence in the methodological approaches taken in the videogame content literature. These studies have relied on content-analytic techniques that were developed first for print media, and then adapted to linear electronic media (e.g., film and television). Among other methodological shortcomings, these studies fail to consider that interactive media may present unique implications for sampling, unitizing, and content generation (Schmierbach, 2009) and that simply reapplying these techniques to videogames and other interactive content may lead to an inaccurate depiction of the ways in which game content may fluctuate.

Also overlooked in the robotic reapplication of these techniques is the role that the game player herself will likely play in the generation of interactive content. There is reason to believe that individual personality characteristics, and past gameplay (either general or with the game in question), may impact the frequency, nature, and context of violent game content. The gameplay experience will also likely vary based on the experience of presence, or "a psychological state or subjective perception in which even though part or all of an individual's current experience is generated by and/or filtered through human-made technology, part or all of the individual's perception fails to accurately acknowledge the role of the

technology in the experience” (Lombard, 2000, cited in Bracken, 2006, p. 725). This chapter reviews past research on the effects of violent videogames. It goes on to discuss past videogame content analyses, as well as the linkages between personality, game experience, and presence and behavior in interactive environments. It then presents the one standing study that has made a small attempt to explore these relationships, and concludes with discussion of future directions for evaluating violent game content.

Research on Videogames and Violence

Previous Research on the Effects of Videogame Violence

Research on the uses and gratifications of videogames reveals that children, adolescents, and adults alike spend a substantial amount of time playing videogames. Recent research suggests an upward trend over the last 10 years in the amount of time children ages 8 through 18 spend playing videogames, from 26 minutes per day in 1999 to 86 minutes in 2009 (Rideout, Foehr, & Roberts, 2010). The knowledge that home videogames are both prevalent and feature graphic violence has led to a long tradition of videogame effects research, dating back to the early 1980s (Dominick, 1984). Much of the early research on the effects of videogame violence was correlational in nature. For example, Wiegman and Van Shie (1998) found a relationship between a preference for violent games and reports of violent behavior; other studies have offered similar findings with kids (Dominick, 1984; Lin & Lepper, 1987) and adults (Anderson & Dill, 2000).

Numerous laboratory studies have also attempted to establish a causal link between gameplay and aggressive responses when provoked. Anderson and Ford (1986), Ballard and Lineberger (1999), Anderson and Dill (2000), and a number of other experimental studies suggest a causal relationship between violent videogame play and immediate subsequent aggression, while Shutte, Malouf, Post-Gordon, and Rodasta (1987) offered that children who played violent games were likely to react violently when provoked after gameplay.

Previous Content Analyses

Concern over the potential link between violent videogame content and aggressive behavior has more recently led to a number of content-analytic studies attempting to quantify the frequency of videogame violence. These studies have also attempted to identify problematic contexts for violence, based on past research in television and film indicating specific context outcomes related to aggressive attitudes, behaviors, and desensitization.

Braun and Giroux (1989) performed an evaluation of 21 arcade games in their efforts to quantify the rate at which the destruction of characters typically takes place. They posited that about three-quarters of their sample featured the death or destruction of others, and that this content was more commonly found in games with themes concerning war or crime. Dietz (1998) reported similar findings in an *ad hoc* evaluation of 33 games for the Nintendo and Sega Genesis home gaming systems.

Smith, Lachlan, and Tamborini (2003) attempted to apply the coding and analysis plan of the National Television Violence Study to videogames, with particular concern for the ways in which frequency and context of violence might vary across game rating. They found that videogames rated for mature audiences were more likely to contain repeated violence, gun violence, and bloodshed and gore. A series of follow-up studies using these data posited that videogames may be more likely than television to present gun violence that is unrealistic, justified, and repetitive (Smith et al., 2004), and that violent perpetrators in videogames are often White male characters, not dissimilar in appearance to those toward whom violent games are marketed and who may thus see the perpetrators as attractive behavioral models (Lachlan et al., 2005). Haninger and Thompson (2004) examined an hour's worth of taped content from 81 popular games rated "T" for teen, in an attempt to identify problematic content in games rated for younger audiences and examine content taking place in different time frames during the game. They argue that about 90% of the games rated for teens necessitated the use of violence, while 69% required game players to kill other characters.

While these studies provide important data in the ongoing social dialogue about violent games, the methodological approaches taken in these studies have been based on past research on linear media such as print, television, and film, and have failed to consider the possibility that videogame content may vary from player to player.

Conceptual Shortcomings

To date, videogame scholars have relied heavily upon content-analytic techniques that were never designed for interactive media (see Schmierbach 2009 for a comprehensive review). In particular, the content analysis research on videogames has been criticized for questionable sampling procedures, coding conventions, levels of data analysis, unitizing, and variable selection. While these are valid concerns, less clearly articulated are conceptual issues related to interactivity and to variation in content across multiple game players.

This chapter will limit discussion of these conceptual limitations to the evaluation of violent content in videogames. However, further exploration of the conceptual issues associated with quantifying videogame content across many contexts is encouraged, and it is hoped that this chapter will at least provide a stepping stone in initiating that conversation.

Incorporating Conceptual Issues into Videogame Content Research

The Role of Player Personality

It is likely important to consider the personality characteristics of individual game players and their subsequent effect on game content. A substantial amount of research on the effects of television and film violence has identified particular personality characteristics as covariates in aggressive responses, the formation of aggressive attitudes, and the acceptance of observed violence. In particular, trait aggression and psychoticism have been identified as covariates that may positively predict aggressive responses to violent media; those who may exhibit stronger tendencies along these factors may be more subject to the influence of violent media. Further, past research has indicated that those higher in trait empathy may be less likely to respond aggressively after exposure to film or television violence. In terms of the moral approval of observed aggression, past research has indicated that personality traits such as vigilantism and a desire for social justice may impact the extent to which audience members morally approve of observed aggression.

Personality characteristics have also been demonstrated to be important considerations when considering the appeal of videogames, and the extent to which they predict game selection and enjoyment. Hartmann and Klimmt (2006), for example, offer that a number of personality characteristics related to action tendencies, competitive tendencies, achievement tendencies, aggression, and frustration may play a role in the games that individuals are inclined to select. With regard to aggression, they offer that those with more aggressive personality characteristics and tendencies may be drawn to aggressive content, in a manner similar to past research on selective exposure to linear media.

What makes videogames different from television and other linear media, however, is the ability to make decisions within the context of gameplay and alter the content of the mediated experience through these decisions. Personality tendencies, including trait hostility and trait aggressiveness, are at least partially conceptualized in relationship to certain action tendencies. In terms of aggression, this may include the likelihood that one will choose to engage in violent or hostile behaviors with or without provocation and the tendency of the individual to use aggressive tactics to achieve behavioral goals.

When we narrow the focus of this line of reasoning, there appears to be a specific relationship between aggressive personality characteristics and game content. The very same personality attributes that draw game players to particular titles, and that may moderate their responses to aggressive game content, may also affect decision-making within the context of gameplay. It is therefore the case that these user personality attributes will alter the content of the game experience itself, since both

short-term responses and long-term plot turns will be related to whether or not the player decides to use a game character to enact violence, how to do so, what extent to do so, and to whom.

Prior Experience

It is also the case that past experience with videogames, and perhaps with a specific game title, will affect the way in which the content within that game title will unfold for the experienced or inexperienced user. Videogames are, of course, games. Part of the appeal of any game revolves around the presentation of challenges that may be easy to understand, but difficult to master. With regard to videogames, they present the game player with challenges that vary over time, as through experience the game player will learn to overcome certain obstacles and tackle new ones (Hartmann & Klimmt, 2006). Thus, it can be expected that through experience with a particular game, the decision-making opportunities for the use or non-use of aggression and the means in which it is used will vary as a function of experience with the game.

Further, the level of experienced immersion and interactivity discussed below is likely to vary based on game experience. Lee, Park, and Jin (2006) have offered that as game players become more familiar with an interactive environment, they are more likely to become comfortable with navigating and interacting with the environment, producing cleaner sensations of presence. This makes sense logically. If you think about the first time you may have played a particular game, you may have had difficulty navigating the environment, using the controls, interacting with other characters, and so on. Through repeated gameplay, you probably became more comfortable with these factors.

It may also be the case that experience with games in general may influence the content experience. While there is a great deal of variability from game to game in terms of the plot, content, and decision structures, there are some conventions that are consistent across games. Many first-person shooter games, for example, are built using one of a handful of graphics engines. Haptic devices, such as joysticks and remotes, tend to be similar across games and game systems. A relative level of familiarity with these more common game elements may also play a role in the ability to experience certain challenges and immersion, and in turn with decision processes and content outcomes.

Presence

Prior investigations of videogame content have failed to consider the role of presence in the production of videogame content, despite the fact that several studies (Howe & Sharkey, 1998; Tamborini, 2000; Witmer & Singer, 1998) have posited that

the experience of presence will directly impact behaviors within interactive environments. Steuer (1992) and others have defined presence as the extent to which we perceive that we are actually present in a mediated environment, as opposed to feeling present in our natural physical environment. The experience of presence within a mediated environment is likely to range along a continuum from relatively high to relatively low, depending on some combination of one's susceptibility to the experience of presence as a trait characteristic, as well as attributes of the interactive environment that may interact with these tendencies to produce a highly immersive experience.

Witmer and Singer (1998) have extended this definition to specify involvement and immersion as psychological states that underscore the feeling that one has left their physical environment and become immersed in a mediated one. Tamborini (2000) argues that the vivid audio and visual features and interactive nature of videogames and other modern interactive media are likely to evoke these feelings of involvement and immersion. Since contemporary videogames feature sophisticated haptic controls, lifelike graphics, and advanced artificial intelligence in terms of the characters found within games, they are likely to produce strong feelings of immersion and interactivity, even among those not especially predisposed to these experiences. It is not difficult to see how these levels of immersion within the mediated environment, and the extent to which they simulate real-life actions, may impact the propensity toward using violence if the game player in question is already predisposed toward aggressive tendencies.

This process is further complicated by the notion that not only are videogames inherently high in presence compared to other media, but that this increased degree of presence may be a critical component of the appeal of videogames. Tamborini and Skalski (2006) have argued that videogames provide powerful mental models of both the self and others, and that these mental models provide a certain sense of connectedness to others that are not offered in other more linear media. In this way, some presence features such as social presence (see Biocca, Harms, & Burgoon, 2003) are not only psychological experiences that may shift the decision-making processes and subsequent content, but are part of the very appeal of the game itself. As such, evaluating the extent to which the game player experiences these varying forms of presence and/or their trait susceptibility to these experiences may allow us to predict the nature of the content that an individual will produce in varying circumstances.

Much like the argument above concerning aggressive personality characteristics, it is easy to see how one of the aspects of videogame play that is found appealing by videogame players may also impact the nature of the content that is produced. If the experience of presence is inherently part of the appeal of videogames, and the experience of presence is also related to decision-making processes concerning aggression and subsequent aggressive content, then the very motive for playing in the first place may be related to the content outcomes that can be expected within a given interactive environment.

In summation, there is reason to believe that videogame content is a far more complex phenomenon than has been articulated in past content-analytic research in

the field. It is not likely to be a function of the game alone, but is more likely a combination of user attributes, such as personality and past experience, and the extent to which the interactive game environment replicates real-life interactions, providing the game player with a sense of presence. The susceptibility of the game player to become immersed in the interactive environment then becomes an equally critical consideration, alongside personality characteristics and past gameplay experience. In order to fully evaluate the potentially risky violent content in popular videogames, one must simultaneously consider not only the game itself, but characteristics of those inclined to playing the game.

Further, it may be the case that these relationships are game dependent. While most content-analytic studies have attempted to present “snapshot” views of the universe of videogames, their attempt at making sweeping statements about the nature of content across all games might be misguided. Intuitively, it is likely the individual subtleties related to gameplay within individual games beget relationships between these variables that will change dramatically across different games. To this point, very little empirical research has attempted to explore the ways in which game player characteristics might be related to potentially risky content, and the ways in which these relationships may shift from game to game.

Lone Study

Despite the variability in game content that one could expect given these user characteristics, a single study conducted by myself and Erin Maloney (2008) has attempted to draw linkages between user attributes and quantified game. We decided to take a first stab at exploring the relationship between user attributes and game content, by looking at a number of game participants playing a small number of games. Using conventions drawn from experimental research, we recruited 160 research participants and randomly assigned them to play one of four violent videogames. Using the same coding scheme and analysis techniques as Smith, Lachlan, and Tamborini (2003), we routed the audio and video signal through a VCR, recorded the content, and then subjected the content to the analytic procedures. This allowed us to examine content characteristics across all four games, and to break down the pattern of content within each game. It also allowed us to use inferential statistical techniques to draw associations between user attributes and patterns of content, both within each game and across all games in the study.

The results of our study, albeit one with a small sample and a limited number of games, provide evidence of tremendous variation in game content across the game experiences of individuals playing exactly the same game at the same stage (the beginning of the game). Without going into detail beyond the scope of this chapter, the rate of violent exchanges, the frequency with which certain context features were present, and the nature of the violence in question varied greatly both within and across games.

For example, 40 participants played the game *SoCom: Navy Seals* for a period of 20 minutes from the beginning of the game. Across those 40 participants, the mean number of violent interactions was 43.14, with a standard deviation of about 20. In other words, in the distribution of the number of acts of violence, the middle 64% of them fell approximately between 23 and 63. Characteristics of these violent exchanges contained a great deal of variation too. The number of acts of violence featuring firearms averaged about 40 with a standard deviation of about 20. The number of acts depicting extreme harm (severed body parts or visible entrails) averaged about 20 with a standard deviation of about 9. The list goes on and on, but the bottom line is that with this and three other games, there was tremendous variability in both the frequency of violent interactions and the frequency of certain context characteristics associated with that violence.

We then went on to explore the relationship between individual personality characteristics, presence, and the frequency of these occurrences. Using multiple regression analysis, we linked attributes of the game players to the variability in these content characteristics across all four games. The analyses involved the simultaneous consideration of a number of game player attributes: these included demographics, perceived realism, trait aggression as measured by the Buss-Perry Aggression Questionnaire (physical aggression, verbal aggression, anger, and hostility), the factors of the Revised Eysenck Personality Questionnaire (extroversion, neuroticism, psychoticism, and social desirability), measures from the Social Justice Questionnaire (empathy, vigilantism, and punitiveness), and telepresence tendency.

The analyses produced significant statistical models of three of the dependent content variables: the number of unjust acts of violence, the number of violent acts involving handheld firearms, and the number of acts in which no harm to the victim was observed. Income and hostility psychoticism positively predicted the frequency of unjustified acts of violence, while trait hostility negatively predicted the frequency of these observations. Argumentativeness and empathy positively predicted the frequency of gun violence, telepresence tendency negatively predicted gun violence. Psychoticism positively predicted the number of acts that did not portray any kind of harm.

While the initial analyses indicated that one's propensity toward experiencing presence and individual game player personality characteristics may influence game content across the entire study, we were also interested in the extent to which these relationships may be variable from game to game. Logically, it may be the case that the plotlines, gameplay, and highly specified game characteristics might impact whether or not these user attributes affect violent content. In fact, we recommended examining these relationships within the contexts of individual games, rather than attempting to generalize from a small number of games to the universe of videogames on the whole. These statistical analyses were then repeated within individual games, in order to explore the possibility that different user characteristics may predict different content across different games. Generally speaking, the results revealed the expected outcome: that the game player-level predictors of the frequency of various violent content outcomes were variable from games to game.

For example, within those subjects playing *Rainbow 6*, the analyses revealed only two significant models. Trait physical aggressiveness positively predicted the frequency of justified acts of aggression, while empathy negatively predicted the frequency of these interactions. Game players who were higher in their levels of both verbal aggressiveness and vigilantism were, for some reason, more likely to commit acts of violence in which the victims were not depicted in a manner exhibiting tangible physical harm.

The within-game analyses for *SoCom: Navy Seals* painted a much different picture in terms of the user characteristics that may affect gameplay. While these factors did not affect the frequency of any specific type of violent interaction, they did predict the total number of violent acts coded within the game over 20 minutes. Across 40 participants, psychoticism tended to negatively predict the total number of acts of aggression, while the frequency of these interactions was positively related to extroversion, social desirability, and empathy.

Two statistically significant sets of relationships were detected within *Grand Theft Auto 3*. The number of unjustified acts of violence observed during the gameplay session and the number of acts of violence using natural means of aggression were both related to game player characteristics. Trait hostility negatively predicted the number of unjust acts of violence observed across those playing this particular game. Within *Grand Theft Auto 3*, numerous player-related variables predicted the number of acts using natural means. Trait verbal aggressiveness, argumentativeness, and extroversion positively predicted the number of violent acts using natural means such as punching or kicking, while there was a negative relationship between these types of acts and the game players' levels of hostility, vigilantism, and immersive tendencies.

For the final game in the analysis, *Grand Theft Auto: Vice City*, we found no significant relationships between user attributes and the frequency of varying types of violent content. None of the personality attributes they explored were related in any way to the content outcomes under consideration.

What to Make of This?

This leads us to the question of how to interpret these findings, and where to go from here. A fairly substantive body of research has argued for a relationship between playing violent videogames and antisocial effects on game players. In the wake of these studies, a number of content-analytic studies have attempted to evaluate the frequency and context surrounding videogame violence, and to identify specific presentations of violence that have been found problematic in other research contexts (e.g., television and film). While these studies provide valuable data concerning patterns of gameplay content, our study examining the role of player attributes has revealed findings that are inconsistent, difficult to explain, and highly variable across only a small number of games.

The findings from our study (Lachlan & Maloney, 2008) suggest the potential for quantifiable relationships between game player characteristics and game content, but more broadly they suggest to us that our understanding of videogame content might be seriously underdeveloped. In this one data set, not only is there a great deal of fluctuation in the frequency of violence and the contexts associated with these interactions, but these fluctuations are different across different games, different game players, and are on occasion systematically related to different game player attributes. Further, the findings concerning the relationship between the user and violent content are often counterintuitive, suggesting that we may need to revisit our conceptualizations of game content and the decision processes on the part of game players that are critical in the production of this content.

Variability in Game Content

Within and across multiple games, it appears as though the frequency of different types of interactions is highly variable. This variability casts serious doubts on the plausibility of past conceptualizations of interactive content, both in this context and in others. For the most part, previous content-analytic studies on videogame violence have presented a “snapshot” of the frequency, nature, and context surrounding violent interactions in a given game by analyzing a single unit of content, generated on one occasion, by one game player (typically one of the researchers or a research assistant). There may be alternate directions for conceptualizing exactly what game content is and how it should be measured. The current chapter offers that videogame scholars begin to think about content as a *dependent variable*, as opposed to a static content outcome that can be measured using the techniques and conventions germane to linear content analysis. In other words, it may be more useful to think of videogame content as an outcome, one that is dependent to an extent not only on the game parameters, but also on user characteristics, presence, gameplay experience, and so on.

If we are to conceptualize content units as dependent on multiple factors, then perhaps the approaches that we take to content from a methodological and data-analytic standpoint can be grounded differently. Instead of thinking of content units and analyses as comparable to linear content, it may be the case that videogame content (and, for that matter, any interactive content) bears a closer resemblance to data conventions more closely associated with behavioral research. This approach – thinking of content characteristics as dependent variables based on multiple predictors – would allow game researchers to use inferential statistics to estimate the true scores of varying content units in a universe of potential content experiences associated with any one game. Over a large number of players, the frequency and context of various content attributes could be estimated. By thinking of content outcomes in terms of means and standard deviations, game researchers could begin to assemble a more sophisticated picture of game content, and one that might be

more representative and generalizable (at least within game). While this approach might be time consuming and tedious, it would allow for the evaluation of measures of central tendency along any given content outcome. This would not only allow for more sophisticated evolutions of game content within a given game, but would allow for comparisons in game content across games, systems, genres, and ratings using different inferential procedures involving mean comparisons (*t*-tests, ANOVA, etc.).

Variability Based on Presence

In addition to this reconceptualization of content, the findings of our study (Lachlan & Maloney, 2008) force us to reconsider other assumptions regarding game content. While the study did not measure the level of presence experienced, it did measure telepresence tendency, or the individual user's susceptibility toward experiencing presence experiences. For the most part, presence tendencies were not strongly related to the likelihood that certain types of violent content would appear. However, there were a few instances in which presence *negatively* predicted the frequency of some types of aggressive content.

While this may appear counterintuitive, further consideration of the role of presence in interactive violence leads to a logical thread not dissimilar to that associated with past game experience. It may be the case that those who are prone to experiencing presence may have an increased capacity to take a task-oriented approach to the use of violence. In these circumstances, violence can be used by the game player as a means of accomplishing certain tasks, while random nonsensical violence may be more closely associated with those who have not adapted well to the virtual environment. In other words, the more comfortable one is with the game, the better one adapts to and maneuvers around the environment, the more one can strategically use a small number of violent acts to efficiently accomplish a task or meet a goal. While logical, this commentary is somewhat speculative, and scholars should further consider the exploration of presence and habituation to virtual environments on the decision-making processes that lead to aggressive or violent content.

Variability Based on Past Game Experience

Notably, our 2008 study did not include past game experience – either in general or with the game in question – as a predictor of game content. This is perhaps problematic, as we could expect certain variability in the production of violent content based on familiarity with the game.

While research has not directly addressed this possibility, it is not difficult to see how familiarity with the game could affect these outcomes. What might be counterintuitive is the ways in which it may affect content. When thought through to its

logical end, it may be the case that game experience actually *reduces* the frequency of aggressive outcomes.

For example, let's take *Grand Theft Auto: Vice City*. In this game, there is an early stage in which the character played by the game player has to break into a golf course, ride a golf cart around, locate an enemy character, and kill him using a five-iron. An inexperienced player might be inclined to swing at anything that moves, while following unfamiliar cues throughout the physical landscape of the game. A game player with prior experience, however, would know the whereabouts of this character within the virtual realm, be able to identify this character, understand the reward structure inherent in eliminating this character, and kill him rather quickly and efficiently. Anecdotally, while coding much of the game content, coders in our study noticed that poor game players tended to log higher frequencies of all kinds of violent exchanges. Players that "got themselves killed a lot" were more inclined to behave aggressively toward most or all of the characters they encountered during the gameplay period, and were given more opportunities to attack the same characters as they found themselves having to repeat various levels of the game.

While this is an anecdotal observation drawn from one study, it does raise an interesting point: that we may have to reconsider whether or not the frequency of violence or of the occurrence of certain types of violence is of paramount importance, or whether familiarity with the game environment underscores a certain clinical approach to the use of violence that may attenuate the frequency with which these acts of violence take place.

Variability Based on Personality Differences

This study also examined the impact of personality characteristics on the frequency of violent occurrences, both across all four games in the study and within individual games. While the results generally suggest a link between these individual attributes and different types of game content, there is very little consistency in the extent to which what personality characteristics predicted what type of content from game to game. In fact, even the direction of the relationships between certain personality characteristics and content outcomes is inconsistent. This further complicates our understanding of the interactive nature of content, and the ways in which certain personality tendencies may interact with parameters of the game itself to predict certain types of content.

Let's return to the *Grand Theft Auto* series, this time looking at the analyses that were run on *Grand Theft Auto 3*. Intuitively, one might think that trait hostility would positively predict various aggressive acts. It's a fairly logical line of thinking: a more hostile person is given the opportunity to aggress in a simulated environment, with a reward structure associated with this simulated aggression, so they take full advantage of the opportunity and commit more acts of simulated violence than a less hostile person.

However, this is not the case. In this particular study, trait hostility was negatively associated to the frequency of unjustified violence committed across all four games, and violence involving natural means (such as punching and kicking) in *GTA:3*. With regard to the relationship between hostility and unjustified violence, it may be the case that those who are high in hostility are prone to enact aggressive responses *specifically when provoked*. This would then limit aggression responses to characters within the virtual realm that are recognizable as presenting a credible threat, as opposed to those of an unknown or good nature.

As a function of the storyline and interactive realm of *GTA:3*, game players are allowed to roam around the physical environment freely, interacting with other characters as they please. At times these can lead to positive outcomes (such as acquiring money or information), or negative ones (such as getting arrested or killed). As a result of the freedom to make choices concerning how and when to approach other characters, game players must go out of their way to utilize physical aggression involving natural means. If one chooses to aggress, there are faster, more efficient means of committing violence, such as shooting another character or running him/her over with a vehicle. Those who are predisposed toward hostility may prefer to use aggression strategies that do not involve direct contact with other characters, but instead offer a quick and easy means of eliminating other characters. Thus, the specific parameters of gameplay in *GTA:3* may lead to an association between a personal-ity attribute and a particular violent content outcome.

Numerous other examples of gameplay parameters leading to these relationships between user and content can be seen across the study. Physical aggressiveness predicts justified violence in *Rainbow 6*, but not in the other three games in the analysis. Empathy negatively predicts justified violence in *Rainbow 6*, even though it positively predicts gun violence across all four games. While only a single study using a small number of games and players, our study (Lachlan & Maloney, 2008) provides initial evidence of a problem in the content-analytic research later articulated by Schmierbach (2009) and others: that the interaction between game player attributes and highly specific aspects of the game itself is likely to produce tremendous variation in content, and that this variation will often be difficult to predict.

Conclusion

While not addressing other recent criticisms of the videogame content analysis literature, our study does shed light on the largely overlooked interface between game player and game parameters. When thinking about this particular study, combined with what we already know about the relationship between gameplay and aggression, we are drawn to three conclusions. First, we should expect a great deal of variability in game content from user to user. This fluctuation within game content across different players, regardless of the more specific factors that predict these

fluctuations, suggests that we may have to revisit our conceptualizations of game content and the conventions with which we have historically analyzed game data.

Second, presence and past experience with a given game may sometimes play a role in the content that is produced. Making this picture a little murkier is the notion that telepresence may be negatively associated with violent content. This suggests a need for research addressing habituation to videogames, task-oriented virtual aggression, and perhaps even our most basic concerns when it comes to the link between violent game content and aggressive behavior. While behavioral research on television and film has historically been grounded in concern over the frequency of observed violent interactions, the real concerns associated with videogame violence might be quite different. Wildly excessive repetition of violence may simply take place as a function of unfamiliarity with the game system or an inability to experience presence in the interactive environment. Lower frequency of violent interactions, while appearing benign, may actually be the product of a systematic, clinical understanding of the use of violence in instrumentally accomplishing tasks.

Finally, the potential relationships between game player personality characteristics and videogame content require further inquiry. These relationships appear largely inconsistent across different games, and may force us to reconsider our units of analysis and the degree of generalization we seek to accomplish in studies evaluating these relationships. For example, it may be difficult (if not impossible) to make a statement regarding what impact psychoticism has on the frequency and nature of violent content across all videogames; it may be completely plausible, however, to evaluate this relationship within one game or a handful of games from a particular genre or series. This limitation in the extent to which we choose to generalize stems from the argument that the relationships between player attributes and content are a product of specific gameplay parameters of each game.

Transmedial Aesthetics

Where Form and Content Meet – Film and Videogames

Tanya Krzywinska

ABSTRACT

Videogames may offer new ways of telling stories and engaging players by virtue of their interactive characteristics, but do they offer any differences from cinema in terms of content and representation? While videogames are formally distinctive, this chapter shows that, to a lesser or greater degree, they nonetheless draw on vocabularies developed within cinema. Through an examination of *Final Fantasy XII*, as well as with reference to a range of other games, this chapter analyzes how, through an interlacing of form, content, and representation, videogames work in convergent and divergent ways to create for the player an emotionally resonant aesthetic experience.

Convergences and divergences between film and videogames have been the subject of some quite considerable analysis within the context of recent academic work, conducted mainly within the emerging field of digital game studies. Within this is a pivotal engagement with the way that form shapes content. This relationship is the focus of this chapter, which further takes as a central analytic example the game *Final Fantasy XII* (Square Enix, 2006). While by no means all academic work focused on videogames is conducted by those with a scholarly interest in film, several game studies academics have a film studies background, including myself, Diane Carr,

The International Encyclopedia of Media Studies, First Edition.

Geoff King, Bernard Perron, Bob Rehak, and David Surman. What is remarkable is that many existing analyses focusing on the distinctions of form and content between videogames and film stress that the former should be regarded as a distinctive form in their own right, despite videogames also being a screen-based audiovisual medium. In early work on videogames, scholars such as Espen Aarseth, Jesper Juul, and Markku Eskelinen expressed an understandable concern that the interest shown in videogames by film scholars would entail games being subsumed as a subsection of film studies. Old theories and arguments used in the analysis of film would simply be rehashed without paying due attention to the considerable differences and unique features of digital games. Further, the fear was that the use of film studies models might stultify the broader process of exploring what digital games could potentially become. To their minds, these interlopers came along with a risk of dismissing what is specific to videogames in terms of their formal and ludological features, their design and construction, and the unique experience of playing them. This is not, however, evident in most of the existing work conducted on games from those with a film studies background. The consensus of opinion is that, unlike film, videogames are rule-based, place emphasis on player agency, and are governed by ludological rubrics. This is clearly a formal distinction, but does it make for a distinction in terms of content? In many ways form and content are co-dependent, yet in some regards the same tropes simply become remediated.

While it is crucial to note the formal divergence between film and videogames, it is nonetheless the case that videogames do draw on film form and content (as well as other media) in a variety of ways. Award-winning game designer Peter Molyneux has said that cinema provides game makers with good and well-developed models for creating engaging characters and for making more meaningful and emotionally resonant gameplay features.¹ As well as showing that game designers often look to cinema for inspiration (and, indeed, in some cases aspire to the financial and critical successes of cinema), this comment provides an example of David Bolter and Richard Grusin's influential concept of *remediation* (2000). Games are not made in cultural isolation; many features of existing media inform the strategies used in new media, but the exchange is far from simple and straightforward. This means that both form and content are likely to be informed by established media formations.

Critical perspectives used within film studies, including approaches drawn from other disciplines but tailored to the task of addressing film, can be used to highlight convergences of form and content between videogames and film. Close formal analysis of the type used in film studies to analyze the structure, impact, and meaning of the moving image is of particular use in understanding games, and implicitly formal analysis is also considered with content (story and character in particular, rather than representation and reception). Formal and content analysis can also be applied to the ludic and participatory elements offered by a game, even if these core elements are what make videogames qualitatively different from other media. Other types of approaches used in film and media studies to analyze reception, the types

of investments and interpretations that audiences and individual viewers bring to the text, are, however, very useful to help understand the qualities and affordances of games themselves, their role in contemporary culture, and indeed why certain formal and content formations have proved popular and affective with audiences. Film-based approaches can also be used in a comparative way to ascertain significant differences between the two media. Models and methods derived from art studies, media studies, social science, philosophy, psychology, and psychoanalysis developed for the analysis of screen-based media can also prove helpful to the process of understanding more fully some of the pleasures offered by games, pleasures that needed explaining in terms of the interplay between form and context, as well as the ways in which videogames are embraced by broader social, cultural, and ideological contexts. That is not to say that there is no need for the development of bespoke approaches that emerge from the particular questions videogames provoke, and there is room, of course, for the analysis of representation. There are some aspects of videogames that do indeed demand new concepts and models if we are to understand better their particularities, influences, and potentials in terms of both form and content. This analysis focuses not on representation, however, but on the relationship between form and content.

While videogames have various formal, content, and industrial links to film (industrial convergence is addressed later on), the centralization of the ludic, player agency, and interactive components, as well as the actual business of designing and making them, means that videogames diverge in some significant ways from film. As a means of highlighting some of these differences and to show the particularities of videogames, I will focus on one recent game, citing other examples where they are relevant. This is a game that has, it should be said, a closer relationship to film than many other existing games or game genres. While games such as *Tetris* or *Bejewelled* cannot be described as having either narrative or cinematic camera-based features, the game chosen here has a highly developed storyline, uses many cinematic-styled cut-scenes both in game and “movie” sequences, and the franchise from which it is drawn includes two films: *Final Fantasy: The Spirits Within* (2001) and *Final Fantasy VII: Advent Children* (2005). As such, is it a useful game with which to demonstrate that some videogames share certain features with film in formal and content terms. I keep my analysis to the very opening scene of the game to gain depth. As such, this is not an essay about the game itself but as a means to look at the relationships between form and content in the context of a very cinematic game. Even in a videogame that is clearly inspired by cinema and that uses content formation found across recent screen-based popular fiction, it is, as we shall see, divergent in terms of its form, design, and the type of experience offered in some important and innovative ways. In order to better understand videogames, we have to take account that content is linked to form in a special way. The link is the player. Without considering play – how the player accesses the text through his or her participation in the game – we cannot consider either content or form, as both are intrinsically linked to what the player does.

Aesthetics of Convergence

After loading the first game disk into my PlayStation 2, I sit on the sofa and watch as the opening scenes of *Final Fantasy XII* (Square Enix, 2006) unfold on the television screen, the game controller lying limply in hand. The busy, blink and you miss something introductory montage sequence has all the characteristics expected from a sophisticated and high-budget digitally animated film, and it is designed to be both visually impressive and inviting. The prominent use of widescreen format is inherent to this, representing one of the ways that games and film converge as screen-based media in terms of form and content. More so than 4:3 aspect ratio, widescreen format, first developed for cinema, lends itself admirably to the task of creating the type of visual spectacle that gives the effect of a panoramic vista. The format encourages, as David Bordwell and Kristin Thompson note, “horizontal composition,” and it was first used in genres “in which sweeping settings were important” (2001, p. 212). The game’s opening cut-scene takes full aesthetic advantage, shaping form and content, of the commercial success of widescreen television in the domestic arena (see Figure 21.1). An unanchored camera moves with moderate speed downwards through white fluffy clouds evoking immediately a sense of freedom and movement (to view the opening scene see http://www.youtube.com/watch?v=L20Ph_IC514&mode=related&search=). A small skyship comes into view at the bottom of the screen, further widening the scope of the on-screen space; the camera follows

Figure 21.1 Widescreen, panoramic vistas.

the skyship's swooping trajectory more speedily through the air and over a fantastical sunlit cityscape. Cut to birds in flight, which travel in a contrary direction to the earlier trajectory of the craft, drawing the eye in a different direction and enhancing the sensation of freedom and motion. Strange skycraft that resemble the fantastical, antiquated, steam-punk flying machines of Terry Gilliam's *The Adventures of Baron von Munchausen* (1988) float weightlessly above the city, while smaller craft whiz between them. Sky and earth are tied together through editing and framing into one space – providing an efficient invocation of the game's world – which is a product of form and constitutes a basic component of game content. Using the principle of cinematic attraction, the saturated colors glow with jewel-like intensity, the detailed textures provide visual delight and add further to the sense of epic-proportioned scale, again characteristic of the game's particular content design.

Through a montage of ever-moving dissolves, various vistas of the landscape come into view. A boy looks out to sea, the camera still in flight, never settling to allow quiet contemplation of any one image. We are taken on a fly-mation journey, tourists in a new land. A change of mood: a close-up of heavy armored bodies introduces a counterweight to the previous fluid lines of flight; war darkens the screen and a skycraft plummets to the city, showering flame and debris, its downward motion in sharp contrast to the soaring horizontal axis of the previous and subsequent sequences. A small skycraft curves away into the horizon, creating a huge depth of field, followed by a range of vignettes using in-game graphics of fantastical creatures fighting, fleeing, intercut with sky battles and explosions, while huge, strange, and clearly magic objects throw bolts of light across the screen. All is movement – cinematic form and “world” content bound in unison. The pace then gears down for a short while to show close-ups of key characters in the game, each also talking in animated ways, gesticulating, eyes trained horizontally on their interlocutors, the camera still moving; more creatures are fleeing; the pace and sense of movement, signifying war-induced panic, increase. A clear-eyed anime-inspired boy with hair waving in the breeze looks upward. All this is accompanied by a full orchestral soundtrack that changes mood in accordance with the fleeting images, formal features providing what is often called in the game industry “flavor” (a term that implies content design).

The types of camera angles used, the framing, the character and location exposition are all features born of form and content that we might expect from a mainstream film (the vignettes of characters have perhaps more in common with televisual formats, however). The fluidity of the sequence, the vistas that would be impossible to create in a live-action pro-filmic context, are enabled because this is digital animation (informing form and content, therefore): the camera is not a “real” camera but a totally fictional creation that celebrates the freedoms of perspective offered by the highly flexible fabrications of digital animation. The meticulous attention to movement and light, and the geometries of the visual choreography, are all content designed to capture and delight the eye. And, as with film, only to look on and enjoy what is seen is demanded from the player.

Figure 21.2 The spectacle of procession.

The game title appears after a few minutes of black screen, a result of the game software loading into the console's memory in the next sequence. This represents something of an interruption that would be unlikely in cinema, but it reminds viewers that they will become, in a short time, players – an “X to skip” icon appears in the corner of the screen, a subtle textual indication that this is a game and not a film. A second cinematic sequence ensues, which moves us to the events on the ground, and a date and location appear in scripted text. This sequence is far more narratively loaded than the previous one. Some of the images seen at the start reappear, but this time they are given a stronger context (content forged through formal patterning). A royal wedding procession appears, peopled by a host of human and fantastical creatures including what look like white rabbits playing drums. This draws on, but dwarfs in its scope and spectacle, the type of impressive historical pageants seen in the biblical films of Cecil B. DeMille or Joseph L. Mankiewicz's *Cleopatra* (1963), to which are added the fantastical stylistic qualities of anime (see Figure 21.2), a mode of animation based often on comic books popular in Japan. The scene also recalls the celebratory processions of the *Star Wars* series, which are used to showcase Industrial Light and Magic's special effects and helped to establish the company's centrality to the cinema of digital attractions, a status to which Square Enix also appears to aspire. (The game itself is something of an homage to *Star Wars*.) The young couple, wide-eyed, flawless, and idealized, are married by an elderly priest, making use of a well-worn metaphorical image of Hope. Rapidly the scene changes, as the recently wedded boy-man expresses his intent to go to war and military

processions take the place of the joyous wedding scene, providing an entry into the common war-based rhetorics of games and fantasy fiction more generally. Movie-style credits overlay the scene, present in the corner of the screen rather than prominently centralized, as occurs conventionally in film. Their presence underlines the game's clear aspiration to cinema, marking authorship in a similar way. While company logos are ubiquitous, opening credits have occurred rarely in videogames, although recently they have appeared in high-profile games that have similar production costs to Hollywood films.

A battle ensues, shown taking place alternately in the sky and on land, a series of aerial shots, close-ups, and midshots unfolds, all in third person except for a first-person shot out of the window of a small skycraft; as elsewhere in these opening sequences the framing and editing grammar of cinema is used. In the thick of battle the newly wedded boy-man is slain. To add to the melodrama, his wife sheds a single tear, bowing her head as we are shown, through a classic shot–reverse shot, her lifeless young husband shrouded in flowers in his coffin – again drawing on a well-worn image of melodrama designed to evoke pathos. This montage sequence then clearly aspires to epic and melodramatic registers: the viewer learns of the power struggles in play, the personal tragedies and heroic action that set the particular milieu of the world. The cost of producing these scenes for a film would in all probability mean that they would be made longer and be placed more centrally in the story. We are presented with a world in which the viewer is being invited to become a player. While it is undeniably cinematic, it is perhaps more intense and condensed than would commonly be the case if this were live-action film – game form shaping content.

What we have here is something that looks more like an advert for a film than a film itself (and it is common for attention-grabbing cut-scenes to be made before games go to market to exhibit at industry shows). The effect is to entice the player into the game's world, pulling focus on historical events that provide the context for gameplay. The use of montage provides an economical and evocative sense of the complex world that we are about to enter into as players. While these scenes offer all the audiovisual pleasures of cinema on a grand scale, they also have the function of keying the player into the game world. With the world clearly in chaos, sunlight replaced by war-torn gloom, a series of scripted text screens appears. Some overlay a map of the world showing different states, and a voice, later revealed to be the antagonist in the main game plot arc, tells us what we can read in flowing script of the perilous state of the kingdom of Dalmasca caught in the struggle between two great empires: Archadia in the east and Rozarria in the west. Dalmasca has surrendered to the might of Archadian armies. This breaks the rule of cinema – to show and not to tell – but the encouragement to read the screen here heralds the fact that the player will be required frequently to read scripted text in the game and pay attention to what is written. Written information is part of game form (and genre-based), certainly, but it is also clearly content – a rhetorically designed device that players of such games will expect and which aims to immerse the player further into the virtual space of the game.

During these opening sequences the game controller lay quietly in my lap, although held in such a way that it could be ready quickly for any required action, the presence of the controller acting as a reminder that I am “watching” a game and not a film. The transition from being a viewer, with time to let the eye linger on the luscious graphics, to becoming a player is gently introduced. The game prompts the player to press a key to scroll through the scripted text that explains some of the game’s back story. This is another reminder that this is a game and that games require players to respond to cues through correctly timed button presses on the controller, enabling the story to unfold and allowing actions to be taken. Thus, a primary difference between the modes of engagement offered by games and film comes into view, and this difference clearly affects form and some aspects of content. Again the screen goes black, but this time it opens on a blurred, reverse iris point-of-view shot of one of the soldiers seen in the earlier cut-scene (this blonde, self-possessed warrior is named Basch and is designed through his bearing and look to attract the player into the game space).² There is a scripted cut (edit) from first-person view back to an image of an anime-style boy, on the verge of becoming adult, who is returning to consciousness after being injured. An edit back to his point-of-view locates us in the skin of this character and subject to the attention of Basch. As well as a very cinematic storytelling device, the blurred point-of-view shot, along with the preceding scripted text/map sequence, is used to help mask, at least to some extent, the transition between the high-resolution pre-rendered graphics of the opening cut-scene to real-time graphical rendering – technical concerns shaping content, therefore. Real-time graphical rendering is required in videogames because the on-screen image changes in accordance with the players-characters’ movements and actions – again, technical concerns shape the appearance of content. This marked shift in graphical fidelity is something that would not happen in cinema or even in anime, and the transition marks this out as a game rather than a film.³ It also acts as a call to action for those who are attentive to the visual grammar that is specific to videogames.

I take up my controller in anticipation, now eager to play. But before I am able to act in the game, I watch as Basch fights then kills several heavily armored opponents – whetting the player’s appetite to get stuck into the action. The scene provides an exemplar of what will be expected of the player-character shortly and emphasizes the immediate dangers of the location. Basch then speaks to the player’s character, who we learn is named Reks. Basch communicates with the player in two different modes: he speaks to the player *as* player and also communicates through scripted text that appears at the base of the screen. His speech is always in character, but the scripted text is not, even though it is in first person. At times this accords with the fictional diegesis, but at others it tutors the player in the use of the controller, in how to interact with non-player-characters and how to fight. This acknowledges form but shapes content. For example, “Basch: Do you see the mark above my head? That’s a Talk icon. You can talk to any character showing one of these.”

Direct address to the viewer is used very occasionally in mainstream film, for example at the start of *The Libertine* (2005). However, it is more common within

science fiction and fantasy films that deal with complete fictional worlds as a means of communicating to viewers the often complex pseudo-historical factors that have led up to a present situation (*The Lord of the Rings* films, for example). Games of the type that also take place in fictional worlds, such as the *Final Fantasy* series, use this technique, but it is also aimed to tutor the player. There is a mix of diegetic and extra-diegetic information that would be very unusual in other media, but here is content driven by the participatory form of games. (Diegesis and diegetic are terms used in film studies to denote that which is integral to the given fictional world; non-diegetic or extra-diegetic refers to that which is present in the text but not directly anchored in the fictional world. Non-diegetic music, for example, is not “played” or heard by characters.) This dual register is echoed in the co-presence of speech and scripted text and might appear “odd” when seen together to those unused to playing games who are more familiar with film. Noting such co-presences again highlights how games differ from film in aspects of their content because of an underlying difference of form, specifically, the requirement of participation and the need to tutor the player in the particular design of a given game’s participatory interface (the interface then has to be factored into the content as well as the form of games). If a player does not actively initiate a discussion with the character that Basch has asked the player’s character to speak to by correctly using the game’s interface, nothing more will happen; this is in stark contrast to film, where there is no requirement on the part of the viewer to perform any action to keep diegetic events in motion.

Other extra-diegetic text and graphical features appear on the screen and can be regarded as content that is designed to aid the player in playing the game. Some are situation-specific menus that allow players to initiate fights or choose which enemy they target. Engaging in turn-based combat, which the player is required to do throughout the game as a core activity, produces “health bars” above enemies’ and party-members’ heads (these important feedback mechanisms are part of the game’s content, telling the player about the status of the fight, and diminish as player-characters make a strike with their in-game weapons). Numbers also appear for a few moments to indicate the percentage number of hits; occasionally a word such as “block” or “parry” splashes across the screen, making more sense of the differentiation of hit points achieved in combat. Graphic-based colored arcing lines indicate to the player which characters are attacking and being attacked (see Figure 21.3). Such “feedback” content enables players to make informed choices about what they do. Are the foes too strong? Should they run beyond the reach of these opponents? Or should they change opponents? A fight is therefore busy with information and action. While the informative features are anchored to the actions taking place in the diegesis, they are also in a filmic sense extra-diegetic, but all constitute content and are born of game (and, indeed, generic) form. This demonstrates how, in terms of content, games marry together diegetic and extra-diegetic features to form a gestalt, to use Craig Lindley’s useful term (Lindley, 2002),⁴ between the practical features or rules of gameplay and the fictional world created by the game. Jesper Juul makes a similar point, stressing the intersection between games as rules and games as fiction:

Figure 21.3 Graphic-based colored arcing lines indicate to the player which characters are attacking and being attacked.

“fiction cues the player into understanding the rules, and rules can cue the player into imagining a fictional world” (2005, p. 6). It is the combination of fiction (diegesis) and rules (exhibited through extra-diegetic features) that can be regarded as constituting form and content, that enable players to be agents within the fiction, making videogames fundamentally different from film (even if the representations of gender and war are derived from existing and normative traditions). The gestalt formed in the relationship between game and player means that rules are inhabited and transcended, often through what the player brings in terms of emotional and imaginary investment to his or her character and the game’s world. This only occurs because of the particular nature of the form and its shaping of content.

Therefore, during the game’s tutorial sequence, players are on a learning curve, being shown how to read content as part of what they are expected to do to progress through the game. Continuing with the unfolding of events in the game, more storyline is delivered and Reks finds the King of Dalmasca dead, learning that Basch killed him for his willingness to surrender Dalmasca to the Empire. Reks is once again wounded, this time by Basch (shaping up as the antagonist of the piece). As he falls into unconsciousness – it is unclear whether or not he has died – he calls the name of Vaan, his brother. We soon learn that it is not Reks we will play through

the rest of the game but Vaan. This represents a surprising twist in a game of this type, one that is inimical to game format, as, unlike films, where multiple views are afforded and a switch of point-of-view is common, games often anchor the player's point-of-view to that of one character who represents us in the world of the game, as with Lara Croft in the Tomb Raider games. While some games are not so arranged, in real-time strategy and management games for example, continuity of point-of-view is common within role-play and action-adventure games and helps players to gain a sense of identity within the world of the game. The shift into the skin of a new character accords with the game's cinematic aspirations. It also has a narrative and dramatic function, nascent at this point of the game, yet suggesting to the player either that the death of Reks will motivate Vaan to turn against the Empire or that he may need to be rescued. Through a series of scripted text screens, which shifts the time frame forward, we learn, erroneously, that Basch has been hanged as a lesson to all those who would oppose the Empire. Vaan, through whom the player now acts, is living hand-to-mouth in Dalmasca under the occupation of the Empire, but clearly aspires to being a warrior, the fate of his brother unknown both to him and to the player. As with many other fictions, this state of equilibrium is unlikely to last, but it will allow the player to get used to the game's interface and its particular vocabulary of actions. This again provides an example of content shaped by the demands of the game's participatory form.

The numerous cut-scenes in *Final Fantasy XII* work with the audiovisual grammar of cinema through framing, editing, and camerawork (even if this is rather hyperbolic in a manner similar to high-octane action-movie trailers). During gameplay sequences, however, the framing is anchored to the movements of the player-character, the camera positioned slightly above and behind the shoulder of the character, tracking its movement seamlessly. This is a product of game form, framing aspects of content. Unlike earlier games in the series, *Final Fantasy XII* does not use pre-rendered backgrounds. This means that the camera can be moved independently to some extent to facilitate a more flexible point-of-view, required for checking for objects or enemies and to get a better view of the terrain without having to move the character in the game space (which might in some situations attract unwanted aggression). However, the camera does pivot from a fixed point, which retains a link between the player and the character's perspective on the game world. This marks a significant difference from the more mobile framing conventions commonly used in cinema and plays a profound role in determining the nature of the game's content.

There are some considerable differences between the way that stories are structured and delivered in games and films, although there are some points of crossover. The tightly knit structures of cause and effect often found in cinema do, however, suit the feedback formations that characterize digital games. While it is rare, for example, for repetition to occur, as it does commonly in games (try and try again!), content formations might, however, be closer between games and films. With its greater than usual use of cut-scenes, *Final Fantasy XII* borrows from cinema as well as from tropes developed within the fantasy genre. Well-established fantasy

iconography and characterization, with their tendency to value heroic acts in battles against evil, lend an established generic flavor to the game's content.⁵ As a result of the aspiration to create a game with an epic and complex narrative, the story structure of *Final Fantasy XII* resembles, at least to some extent, the more flexible narrative structures of the type commonly found in recent Hollywood blockbuster action movies. In this sense, *Final Fantasy XII* is more cinematic than most other games. Such films tend to include sequences of action and spectacle that are often said to temporarily suspend narrative in favor of other more visually located pleasures. This might suggest that the structure of popular action-based film narratives has become more like that of games: the long chase sequence near the start of *Casino Royale* (2007), which involves much jumping and running, provides an excellent example. It is also possible that the frequent presence of game tie-ins with films has promoted this so that films can be translated easily into game format, which suggests a move toward what might be termed an aesthetic of convergence.

Narrative as Form and Content

Narrative and story have attracted a great deal of debate amongst videogame scholars. The tools employed to analyze the structure of narrative in mainstream films offer some use for the analysis of story in games, but in many ways they fail to deal adequately with the media-specific manner in which games structure and deliver story. Story is of course constituted in terms of content and form. Models of narrative found in mainstream films are more similar in games that Jesper Juul (2005) calls "games of progression." Such games, *Final Fantasy XII* included,⁶ require the player to follow a predetermined course of narratively framed action and have a more linear construction as a result. "Games of emergence," however, such as management games, real-time strategy games, MMOGs, and role-playing games, have a broader range of options and potential outcomes available to players that make these games more complex and open. These games, therefore, are either not concerned with narrative or are far less plot driven than games of progression. This is clearly a distinction of form, but these differences also influence content in certain respects.

In many games of progression, narrative is shifted more to the sidelines than is the case with most mainstream film. This is the case even in a game like *Final Fantasy XII*, which has a highly developed and complex story. But that is not to say that it is not important as a means of contextualizing what the player does in the game. Moment-by-moment developments, many of which are focused on achieving localized tasks, usually gain narrative importance through their position in the wider frame. Within games of emergence, however, the emphasis is often on what Lisbeth Klastrup (2003) has called the "player-story": the story that emerges through the choices, trajectory, and investments of the player. In *The Lord of the Rings Online*, for example, players are offered an environment that provides a host of means through

which game characters can be developed by players in imaginative ways, interacting in-character with other players should they choose to do so and tailoring play style accordingly. In addition, players are provided with the means to make some significant choices about what they specialize in and they can choose from a list of character types to best suit their gameplay preferences. The game's content (the design of the spaces, the items in the game, the broader mythos and ethos of the game) then supports the player-story, providing props for role play, for example. In addition, various choices are offered that allow the player's character to develop different types of skills. This content is of form, but it is content in a diegetic sense.

To some extent *Fable* (2004) combines features of games of emergence with games of progression: although there is a set path of progression, the player can, as in most role-playing games, choose to specialize in different modes of combat (e.g., spells, melee). Player choices make for some differences in the experience of the game, although they do not provide the breadth of divergence found in many other RPGs. Importantly, then, the scope for player intervention differs in games, and this is an issue not just of form but also of content. *Final Fantasy XII* provides the player with a good deal of freedom of character customization: you can develop Basch into a thief or Vaan into a mage. This flexibility is designed to suit different playing styles, placing greater influence on the player-story where the character of the game content is designed to be shaped by the player, but is often based on cues provided by the game's content (as well as being made possible by the game's participatory form). In all these cases, however, a comparative analysis between the structure and delivery of narrative in film and games can be used effectively to highlight convergences and divergences between the two media in terms of form and content. Significantly, narrative has a more central, organizing role in film than in games. Many games have little or no narrative, and where they do, players can choose whether or not to attend to or make imaginative investment in the game story, or even whether or not they regard their own experience of playing a game in story terms. Some players, for example, might simply choose to skip all the cut-scenes in *Final Fantasy XII*, preferring instead to get stuck into playing the game. From a design perspective, what many fantasy-based role-playing games aim to do to make for a compelling and immersive experience is to enable players to make use of the participatory nature of games to build into the content and form provided, something that makes players feel that their experience is uniquely based on their particular choices.

Affect, Movement, and Time

I turn now to what I regard as a significant aspect of the relationship between film and games and form and content in games that has hitherto received somewhat scant attention, and which builds on points made in the "Aesthetics of Convergence" section above. This absence is likely to have resulted from the centralization within

game studies of debate around the relative merits of ludology and narratology. This has tended to polarize the field. As a consequence, many authors, perhaps to avoid censure, have been intent on highlighting the ways that games diverge from film rather than considering points of possible convergence. Nonetheless, the goal of generating affect, by which I mean making what happens in a fiction matter to player/viewer/reader, is common to both media. Gilles Deleuze's (1986) writing on the affective qualities of cinema, informed by Henri Bergson's (1971) work on time, provides a productive means of considering affect and bodily sensation in relation to games. It also provides an impetus for ascertaining how games create affect differently from film in terms of form and content. The goal to generate diverse affective experience underlies the use of a host of different techniques. Indicative of these are: suspense, anxiety, tension, relief, frustration, anger, pity, delight, surety, and fear. In this sense, representation is often subtended to affect rather than cultural agendas around the politics of representation. Games regularly make use of the types of techniques used in cinema to generate affective experience. Due to space constraints I will focus on two indicative examples. The first focuses on music and the second on graphics and gameplay – in terms of content and form. These examples stand in for a multitude of possibilities.

Both films and games use music and sound effects as important formal and content means of setting a scene or event's emotional pitch. Music and sound often tell us how to read what occurs and also provide a very immediate way of evoking particular physical sensations. As players travel through the area known as the Shire in *The Lord of the Rings Online*, they encounter eight types of music that are representative of the English countryside and a kind of rural authenticity. Each of these musical styles is inspired by folk music. They are divided into jaunty foot-tapping tunes played on acoustic instruments (flutes, violins, and guitar) and more plaintive and wistful tunes, mostly played on single instruments (these are mainly non-diegetic but at times diegetic – in the village of Stock, musicians can be seen playing on the bandstand outside the village tavern, and most taverns have minstrels). In combination with the green and pleasant rural landscape of early summertime, with hobbit homes nestling in the safety of small hills, the soundscape composed of folk music, ambient sounds such as bird song, a gentle breeze blowing, and domestic animals is clearly designed to evoke a desirable pastoral idyll. Representing something of "good" and of value, it is designed to make the player care about its fate when it becomes imperiled. When traveling in the Shire, there is a strong sense of peacefulness and nostalgia for an uncomplicated life (Figure 21.4), a representation that is clearly motivated by a desire to engage the player at an emotional level. The same types of images, sounds, and music (similar style and instruments, although with different intellectual property content) are also used in the early scenes of Peter Jackson's *The Lord of the Rings* film trilogy.

The tranquility and comfort of the folk music is counterpoised dramatically with the music associated with spaces or beings designated as evil or threatening. In the Old Forest region of the game (Figure 21.5), sustained unresolved chords,

Figure 21.4 The Party Tree in the Shire: pastoral idyll.

Figure 21.5 Attacked in the Old Forest by a warped oak.

accompanied by eerie, from-the-depths trombone sounds and tympani, provide an immediate and highly disturbing sense of tension and threat. Exciting it might be, but the representational scheme is designed to motivate the player to fight to conserve in narrative terms the quotidian life of hobbits. Similar types of musical arrangements are heard in the film with similar effects. In each case music, both as content and operating representationally, forms a gestalt with the story – the valuable “small cares” existence of hobbits is threatened by evil forces. In conjunction with jarring and ominous music, the labyrinthine design of the Old Forest, in which the hapless traveler is apt to become lost, with dangerous trees that uproot themselves to kill the unwary, is far from a comfortable and relaxing place to be. Indeed, many players complain in “out-of-character” chat about the place and its perils, which to some extent demonstrates the way in which music, gameplay, reception, and graphics are knit together to produce strong affect. This affect is heightened because of its juxtaposition with the Shire – which is giving potency in terms of content and representation, in much the same way as in the film and the novel, but form means that the player has a real place, real choices and actions to take, in this virtual space.

Whether it is melodic and bright or dissonant, jarring, and dark, music has powerful affective qualities, making it a potent aspect of content and, in some regard, representation. As Henri Bergson has written, the rhythm and measure of music suspend “the normal flow of our sensations and ideas by causing our attention to swing to and fro between fixed points, and they take hold of us with such force that even the faintest imitation of a groan will suffice to fill us with the utmost sadness” (1971, pp. 14–15). Music is affective because, he says, it impresses feelings upon us rather than expressing them, arousing sympathy in our minds “just as a mere gesture on the part of the hypnotist is enough to force the intended suggestion upon a subject accustomed to his control” (p. 16). Toward the goal of producing affect, music is indispensable: the movements of music can move us profoundly, far more easily than visual representational means alone. In broader game history terms, moving from small cartridge memory to CD and then to DVD format has made significant shifts in the amount and complexity of audio in games; the availability of greater space for sound files means that games are now better able to mimic the quality and complexity of sound and music in cinema, which provides thereby an increasingly potent means of making games more meaningful. Music is therefore a powerful component of a game’s content and representational schemes, and is often tied into gameplay activities, for example, hearing a threatening, lethal “warped oak” coming your way before you are able to see it.

In the opening cut-scene sequences of *Final Fantasy XII*, described earlier, there is a heavy emphasis on visual movement that is designed not only to arrest the gaze but also to give viewers through virtual means a physical sense of unanchored movement.⁷ The pursuit of this affective quality drove the design of the content. Through the mobile, airborne camera, aided by the creation, through editing and framing, of a sense of speedy movement in a huge depth of field, a sense of disembodied freedom, of soaring, of not being weighed down and fixed to matter or point-of-view

is strongly present. This is emblematic of both the theme and the broad ethic of the game: fight to free the world from stultifying oppression. Movement, travel, is life and stasis, death.⁸ After the cut-scenes end and play begins in earnest, the player-character becomes earth-bound, limited in where he or she can move by various hard and soft boundaries including non-player characters (NPCs) that represent the oppressive force of the Empire. Vaan, Reks, and, by implication, the player are locked into constrained situations by the programmed organization of the game's space and physics as well as the conditions of the diegetic world. This content ties into the very form of games. These constraints determine the player-character's movements and actions. The player-character is in multiple senses determined (overdetermined in the psychoanalytic sense) to break free and learn how to move and act according to will without clumsy restraint. Form, representation, and content have a pleasing unity, therefore. In short, the goal – the imagined ideal – is unrestrained agency. Significantly, very early on in the game, Vaan passionately proclaims his intense desire to become a flyer, which is finally fulfilled in the last scene of a successful play-through. This ties very neatly into what I regard as the extended metaphor established at the start of the game of flight as emblematic of freedom. Also very neatly (under the badge of fortuitous serendipity), it dovetails with Deleuze's own investment in what he calls "lines of flight," which is used to mean deterritorialization (no longer earth-bound, no longer bound) as a form of resistance to leaden and restrained hegemonic organizations of subjectivity, thought, experience, and life in general. I don't for a moment believe that the authors of the game are intentionally making their game through reading Deleuze; instead, across a range of boundaries including cultural ones, both game and Deleuze use the poetic notion of flight as a metaphor for freedom.

Could the same felt meaning be achieved in a film? Yes, but because of differences of interactive game form, this extends into other dimensions. In the context of a game, through the character, the player actively bumps into various boundaries that are experienced as diegetic limits on play and agency, as well as limitations of the programmed actions that the character can make. This gives, as I have said elsewhere (Krzywinska, 2002), a very direct and felt experience of the way that external forces and bodily realities limit personal agency. It is representational and operates through content, but it is form that provides this hands-on experience of constraints on agency. In the cinematic cut-scenes we are given images and, importantly, sensations of what it is to be free – the cinematics act, therefore, as emblematic of an ideal "free" state unhindered by the restraints of embodiment (unachievable but relative and thereby informative structurally, textually, and affectively). The opening cut-scene seems therefore to represent the sphere of the imaginary and thereby imbues the rest of the game with a certain sense of realism, even if it is represented graphically in anime terms. As well as acting as a counterpoise to the particular embodiment and determinations we experience during gameplay (and in real life), this is also indicative of the high regard that the game designers have for cinema and their own aspirations to achieve the heights of what they think cinema has offered

viewers. Herein lies a damning indictment of the way that games are regarded culturally and industrially as a lower form of activity than filmmaking.

In the game, movement is far more restricted and less fluid than within the cinematic cut-scenes, yet, paradoxically, within these the player is required to do nothing but watch, even as they might capture the imagination and locate the viewer in the soaring realm of the fantasmatic. Taking up suggestions from Bergson (1971, 2004) and Deleuze (1986), the passivity within which we are encased when watching a film results in a high degree of affective intensity. Because we cannot act, the energy that is generated turns inwards, strengthening through the very nature of the virtual affect. If this is the case, then what of games? If we are provided as players with the capacity to act, to have some agency to prevent Vaan from dying in a fight, for example, then is there less affect in play than if we were simply watching him have a fight in a film? Speculatively, I believe the answer is no. Here we cut to the heart of the differences between playing a digital game, doing things in real life, and watching a film. Games require the player to make tightly measured movements in response to what occurs on screen. Agency is condensed within these tiny controlled movements. If we get out of hand, as it were, then we fumble our actions. The act of having to control what we do extremely carefully, to reproduce certain key presses in a given order in response to the stuff of content, means that energies are still folded back on themselves by virtue of the control, or mastery, the player needs to exert. Erroneous play (leading to repetition and stasis) or success (leading to a state of flow and a sense of moving forward through time) both feed into the register of interactivity to create intensity. Frustration ensues when we don't control what we do absolutely, a type of self-blaming frustration that I, at least, have never felt when watching a film. Even if one is frustrated with a film or television show, it is rarely on account of one's own bungled action. If we do get things right, self-satisfaction is the result – the type of affect that makes us feel very good about ourselves, and again that type of affect in a truly physical sense is not something I have experienced when watching a film. Content and representation have, then, a supporting role in the formal player-centric context of games.

Nonetheless, playing a game demands close reading from players, close reading of content and representational schemes, if they are to make the right kind of responses. If you don't pay attention to events, or proxemics and kinesics (the positioning of characters/objects and the way they move) when watching a film, then only potential meanings are lost, whereas in games you, the player, lose far more, and it's *personal*. Games therefore are architected from learning curves that tutor the player in how to read closely the cues provided by a situation and how to react in cognitive and physical terms.

Games and films are different entities, yet as screen media the boundaries between them are far from sealed. Games borrow from film, films borrow from games. Players bring what they know of film to games, and with the recent trend for tie-ins between games and films, viewers are apt to bring to the experience of watching film their knowledge of games. *The Lord of the Rings Online* provides an indicative

example. Imagery established within Peter Jackson's films informs the game and players role-play often using representational character and situation cues from those films (indeed, it appears that more players use the films to inform their presence in the game's world than the books on which the franchise is based). With the Final Fantasy franchise, the games came first. The two films consolidate the game worlds across different, but related, media, and they use crossover imagery between iterations of the franchise. Those who have played the games are very likely to read the films through their experience of the games; intertextuality is therefore a property of content, representation, and form. Popular culture has of late embraced world-based fictions such as these because the format lends itself well to multi-authored cross-media franchises. These become playgrounds for numerous writers and artists, as Henry Jenkins (2006) has said; a context is set up and they are able to make up multiple stories and experiences within the context of the world. Given that convergence is fast becoming core to the business strategies of the contemporary media industry, fictional, virtual worlds offer up a recognizable brand with particular flavors that make use of the various characteristics of different medial forms that can be used to produce a whole range of products to make for greater market penetration. This dovetails all too neatly with increasing technological and industrial convergence, which depends on formulating devices to create long-stay, regularly spending audiences and consumers. As such, the spheres of games and media are merging ever closer in terms of content and representations, even though games and films have a range of formal differences.

ACKNOWLEDGMENTS

I would like to acknowledge Anna Powell's *Deleuze and the Horror Film* (Edinburgh: Edinburgh University Press, 2005), as reviewing Anna's book reignited an interest in Deleuze and Bergson. Thanks to Douglas Brown, David Surman, and Esther MacCallum for their thoughtful and informed comments on drafts of this chapter.

NOTES

- 1 Peter Molyneux in conversation about the influences that informed the design of *Fable 2* (Lionhead) with MA Digital Games Theory and Design students at Brunel University, London, UK, March 2007.
- 2 Basch's character recalls the historical figure of Yuki Hideyasu (1574–1607). Pastiche of Edo grand narratives are a staple of Japanese cinema and also filter into Japanese role-playing games (RPGs). (My thanks to David Surman for pointing this out.)
- 3 The *Final Fantasy* games have often been criticized for the gulf between cut-scenes and in-game graphics, but with each incarnation and with developments in graphics processing, the difference is lessened.

- 4 I differ from Lindley's argument here in that I maintain that narrative and gameplay form a gestalt in their own right, because they work together through the game fiction and rules.
- 5 In Massively Multiplayer Online Games (MMOGs) cut-scenes are rarely used except in opening expositions. *Guild Wars* is, however, a notable exception. Some games have dispensed with cut-scenes completely, preferring instead to deliver story through gameplay, as is the (often celebrated) case with *Half Life* (1998).
- 6 Although often thought of as an RPG, *Final Fantasy XII* has a lot in common with action-adventure games.
- 7 As mentioned above, I point the reader to http://www.youtube.com/watch?v=L20Ph_IC514&mode=related&search= to view the opening cinematic sequences of the game.
- 8 This is echoed in the motif of nethercrite, the reification of magic (a gift from the gods), created by the convergence of magical tradewinds, versus manufactured nethercrite, a creation of the Empire that sucks magic from the world.

Recent Trends in Research on Health Portrayals in the Media

From TV, Newspapers, and Magazines to Websites, YouTube, and Manga

James D. Robinson, Teresa L. Thompson, Jeanine Warisse Turner, Robert R. Agne, and Yan Tian

ABSTRACT

Health information may be obtained in a variety of ways, but the data indicate that the media are a key source for most people. Key topics related to health information in the media include those focusing on various addictions (drugs, alcohol, tobacco), cancer information (focusing on screening, treatment, and coping), direct-to-consumer ads, coronary heart disease, weight concerns, misdiagnosis, mental health portrayals, seizures, steroids, asthma, and genetic issues. Much work examines the accuracy of health information reporting as well as the usability/accessibility/readability of health information. Risk issues are an important component of work in this area. Additionally, nutrition and food safety information is frequently featured. More recent research is most likely to be theoretically based, to focus on unusual health concerns or unusual media, and to provide an international focus. This essay addresses these issues as well as differences amongst various media in the presentation of health information. It concludes with innovative directions for research on health portrayals in the media.

The concern voiced by social critics about portrayals of health issues in the mass media stems from the belief that the mass media are so pervasive that they are nearly inescapable. However, it is not the pervasiveness of the media alone that prompts concern about the way health issues are portrayed in the media. A growing body of research suggests that exposure to those portrayals can impact the audience in a variety of different ways. Discussions of these impacts include social learning and modeling, issue framing, cognitive priming, agenda setting, spiral of silence, and cultivation. While this chapter focuses on media content, audience members can be, and indeed are, influenced by these portrayals under some conditions. Given this, it is important to review recent research examining media portrayals of health issues in order to determine the kinds of information the audience is receiving about health and wellness.

Early literature on media portrayals often focused on media representations of sex and violence because scholars and social critics alike were concerned that the media could promote antisocial behavior. Anecdotal evidence of this potential for audience influence was often provided as a way of demonstrating the need for such research. For example, scholars and social critics cited the statistic that television character Marcus Welby, M.D. received thousands of pieces of mail requesting medical advice (Gross & Jefferies-Fox, 1978), while a major publication like *Time* ("Television," 1984) discussed copycat crimes generated from media portrayals. Examples of these events abound, and include Joseph Brandt setting his wife on fire after watching Farah Fawcett in the made-for-TV movie *The Burning Bed* (1984). Exactly what it means to request medical advice from a TV character is not clearly delineated by those scholars, but the actor Robert Young was not a physician, and if it were not for his success on *Father Knows Best* (1954–1960) and *Marcus Welby, M.D.* (1969–1976), it is unlikely audience members would have been as interested in his diagnostic skills. It is interesting to note that even today the Internet is literally littered with social critics pointing to audience responses to the good doctor Welby.

Media scholars employing content analysis have always been interested in the accuracy of those media portrayals (c.f. Berelson, 1952; DeFleur, 1964). Scholars often compared the race, gender, and age of TV characters with those distributions within the US population as a way of identifying an expected value for the demography of television. Evidence of the paucity of female characters and/or characters of color was provided by comparison with their respective percentages within the population. Similarly, scholars interested in health portrayals have also relied on comparisons between media portrayals and best health practices as a means of demonstrating the accuracy or the inaccuracy of media portrayals (Gerbner, Morgan, & Signorielli, 1982). For example, Kauffman (1980) employed the food pyramid as a criterion for interpreting TV portrayals of eating. Turow and Coe (1985) compared TV portrayals of misdiagnoses with national averages provided by the medical industry. Diefenbach (1997) examined the realism and accuracy of mental health portrayals. He found that characters with mental illness were between 10 and 20 times more violent than US citizens diagnosed with mental health problems.

This trend continues and can be seen in a recent investigation examining prime-time medical dramas. Moeller, Sadler, Moeller, and Rahey (2010) investigated how seizures are portrayed on *Grey's Anatomy*, *House*, *Private Practice*, and the last five seasons of *ER*. Not surprisingly, they found the portrayals a convenient narrative technique for adding drama and pushing the storyline along, but less than accurate in the portrayals of seizures and, perhaps more importantly, the treatment of those seizures. Specifically, 46% of the seizures in the episodes studied were found to be inconsistent with the recommendations of the National Epilepsy Foundation's guidelines for seizure first aid, while only 29% were consistent with those guidelines. Contrary to some portrayals, holding the patient down and/or putting something in the patient's mouth are inappropriate and medically contraindicated.

Health portrayal researchers must also consider the fact that patients want more information about their illness, treatment options, and side effects of treatments than they receive from their physicians. Further, they want written patient information or healthcare literature to supplement the information provided during office consultations (Donovan, 1991). So it is natural that when looking for health information, patients often turn to the mass media. Mills and Davidson (2002) and others have found that television, newspapers, and magazines are important sources of health information for many patients. Similarly, the Internet has also become an important source for health information (Dutta-Bergman, 2005; Fox, 2005).

Scholarly Outlets for Content-Analytic Investigations

In a recent investigation, Manganello and Blake (2010) identified studies published between 1985 and 2005 that examined portrayals of health and health-related issues in the mass media. The search yielded 441 articles published in 182 different academic journals over the two decades. Each article was coded for the type of media examined, health issue, theoretical rationale, and journal title. Forty-nine percent of the articles appeared in just five journals: *Sex Roles* ($n = 23$), *Journal of Broadcasting and Electronic Media* ($n = 21$), *American Journal of Public Health* ($n = 17$), *Journal of Health Communication* ($n = 14$), and *Journal of Communication* ($n = 14$). The most frequently content-analyzed media channels were magazines (35%), newspapers (31%), and television (29%). Fewer than 10% of the articles analyzed more than one media channel within a single investigation. While most of the content-analytic investigations focused on the articles in magazines and newspapers, 45% of the magazine studies focused on advertisements and 16% analyzed articles and advertisements and/or magazine covers. In the case of television, only 27% of the studies examined advertisements and 14% examined television news. The remaining 59% studied entertainment programming on television.

An analysis of the most frequently studied health issues suggests that the majority of the articles focused on substance abuse (22%), violence (20%), sex and sexual behavior (16%), and body image/obesity (15%). Fifty-five percent of the articles cited at least one theory or model as the rationale (or partial rationale) for the study, and 70% reported intercoder agreement or reliability estimates for the content categories.

With that study providing a solid baseline for further investigation, the authors of the present chapter examined content-analytic investigations published over the past five years. The analysis of these investigations yielded three notable trends within health portrayals research: (1) the investigation of a wider variety of illnesses and health issues; (2) the application of a wider variety of theoretical rationales for the investigations; and (3) increasing diversity as evidenced by greater emphasis on international portrayals and a wider variety of media channels.

Recent Trends in Content-Analytic Investigations

The Examination of Illness and Health Issues

Even the most cursory examination of the health portrayals literature leaves the reader with a strong impression that scholars are looking at a wide variety of illnesses and health issues. Without empirical testing it is impossible to state that researchers are examining a much wider range of illnesses and health issues than they have in the past, but it certainly appears to be the case.

For example, Quick (2010) conducted a large-scale content-analytic investigation of the portrayals of steroid use on television news programs. While previous work (Denham, 2004a, 2004b) examined portrayals of steroid use by specific individuals (e.g., Carl Lewis and Ken Caminiti), Quick analyzed all portrayals between 1990 and 2008 on three networks (ABC, CBS, and NBC) to see how the issue of steroid use was framed in the media. Using the health belief model (Janz & Becker, 1984) to generate content categories, Quick found that 64.5% of the news stories studied identified one or more of the barriers facing those individuals when they decided whether or not they should take steroids. The barriers included illegality (73%), drug testing/getting caught (15%), health costs (12%), suspensions (12%), fines for steroid use (<1%), and the expense of buying steroids (<1%). Similarly, stories not mentioning health consequences were far more common than stories identifying the health consequences of steroid use across all three time periods sampled (1990–1996, 1997–2002, and 2003–2008).

A second example of the increase in types of health issues investigated by some scholars can be seen in the interest in direct-to-consumer advertising of prescription drugs (DTCA). DTCA – the marketing of prescription drugs to audiences through newspaper, magazine, and/or television advertising – is a relatively new advertising

technique, and one that has just recently begun being examined by health communication researchers. Among the industrialized nations it is legal only in the United States and New Zealand. Examination of manuscripts sent to the journal *Health Communication* since 2008 indicates that 12 manuscripts focusing on DTCA have been submitted for publication. To date only Sokol, Wackowski, and Lewis (2010) have examined these DTC advertisements to see the kinds of information that is provided to consumers.

Sokol and colleagues (2010) analyzed the five women's magazines with the highest circulation rates (*Cosmopolitan*, *Glamour*, *Redbook*, *Ladies Home Journal*, and *Good Housekeeping*) published between July 2005 and June 2006. The DTC advertisements found were produced by 35 different marketing companies and focused on 56 different medications as well as 36 different medical conditions, the most common of which were chronic conditions (42.7%), mental health problems (15.4%), lifestyle conditions (14.5%), cardiovascular conditions (12.8%), acute conditions (7.7%), and cancer (6.8%). Most often the name of the drug (40%) and the condition to be treated by the drug (62%) were identified in the headline of the advertisement. Initially examining the unique magazine advertisements, the researchers observed that 84.2% of the ads were product claim ads for prescription drugs. Product claim ads identify a particular drug by name and associate that drug with the particular health problem it is intended to resolve or manage. Far less common (10.1%) were: (1) help-seeking advertisements – designed to educate and raise consumer awareness but including no references to any particular drug names; and (2) reminder advertisements (5.8%) – those advertisements that identify medication names but do not link them to a particular malady.

A fourth example of the increase in health issue diversity can be found in an investigation by Johnson, Henderson, Pederson, and Stonecipher (2011). The researchers' concerns over how newspapers portray asthma is predicated on the prevalence of the disease within the population (just under 12% of US citizens have asthma at some point in their lives), the costs associated with asthma (about \$20 billion annually), and the fact that there is no known cure for asthma (American Lung Association, 2010). A total of 203 articles focusing on asthma were identified, nearly half of which focused on issues other than asthma (e.g., air quality and allergies). Eighty-five percent of the stories contained one or more asthma management strategy (e.g., avoidance of drugs), and 43% contained at least one fear-based message (e.g., asthma is scary, asthma is stifling, or asthma can kill).

Finally, recent investigations focusing on health portrayals have not ignored mental health issues. Rather than simply examining portrayals of mental health, and recognizing that physical activity, a healthy diet, social activity, and engagement are believed to benefit our cognitive health, Friedman, Laditka, Laditka, and Mathews (2010) examined 178 articles published between 2006 and 2007 in the 20 most widely circulated magazines with a variety of different intended audiences. They found that the most common focus of cognitive health articles was diet, and there was little discussion of other factors affecting cognitive health such as hypertension or diabetes.

Publications oriented toward the African American audience were least likely to contain stories and columns focusing on cognitive health. Equally troubling was the lack of emphasis placed on social activity as an antidote for cognitive decline – only 15.2% of the articles made mention of this fact. When mentioned, social activity was most often relegated to a list of things that might help, and little emphasis was placed on this important cognitive health consideration. Similarly, physical activity was seldom mentioned by itself as an activity that can reduce the risk of cognitive decline. The importance of physical activity on a variety of other health problems, including hypertension, obesity, vascular health, and diabetes, was also largely ignored.

To strengthen our contention that there has been an increase in illnesses and health issues examined by portrayals researchers, a list of the articles focusing on health portrayals that were submitted for publication in the longest-standing journal in the area, *Health Communication*, between 2006 and 2011, was generated. The partial list of health illnesses and health topics included hormone therapy, sex education, transgendered community websites, sexual behavior and HIV, alcohol abuse, cough syrup contamination, food advertising, congenital cytomegalovirus, cigarette advertising, human papilloma virus (HPV) and the HPV vaccine, nutrient content claims, skin cancer, heart disease, organ donation, DTCA, smoking fetish videos, diet, tanning, health website privacy policy statements, clean air, depression and cognitive health, portrayals of healthcare professionals (including physicians, nurses, nutritionists, psychiatrists, counselors, physical therapists, pharmacists, masseuses, and paramedics), avian flu, medical tourism, breast cancer, substance abuse, alcohol abuse, and breastfeeding. Perhaps the most unusual issues investigated within one of these content studies were Lapinski's (2006) examination of pro-eating disorder websites and Kim, Paek, and Lynn's (2010) examination of smoking fetish videos.

The Employment of Theory

The majority of the studies examined in the writing of this chapter were theoretically based. This comes as no surprise, as Manganello and Blake (2010) found that 55% of the content analyses published between 1985 and 2005 in the journal *Health Communication* cited at least one theory or model. Our examination of all articles published in *Health Communication* between 2006 and 2011 suggests that this trend continues and is strengthening.

Initially a list of all content-analytic investigations that focused on health portrayals was generated. This list contained all articles that were published, rejected, or to be revised and was then reduced to the 22 articles that had been accepted for publication. Each article was then coded for inclusion of a theoretical rationale. Seventy-seven percent of the published articles cited at least one theory or model ($n = 17$) and 31.8% of the published articles cited two or more theories ($n = 7$). Of the five additional investigations focusing on health portrayals, one was a descriptive study of media portrayals, two were rhetorical analyses, and two were textual analyses.

From this analysis it is clear that researchers employ a variety of different theories in their efforts to describe media portrayals of illness and health. Our review of the 22 content-analytic investigations published in *Health Communication* suggests the most commonly employed theory was Bandura's (1986) social cognitive theory (28.6%, $n = 6$). Researchers employing social cognitive theory or social learning theory typically focus on the kinds of behaviors and/or the kinds of information that audience members learn about health from the media.

The second most common theoretical base (19.0%, $n = 4$) for content-analytic investigations was framing theory (Kahneman & Tversky, 2000; McCombs & Ghanem, 2001; Tversky & Kahneman, 1981). Studies based on framing typically focus on how health issues are presented or framed as a way of extending the simpler issue salience approach typically employed by research based on agenda setting. Framing studies look at how the argument or issue is presented rather than just the number of times an issue is presented in the media.

Agenda setting (McCombs & Shaw, 1972) was the third most common theoretical rationale for the health portrayals research examined (14%, $n = 3$). Agenda-setting research focuses on how frequently a health issue is portrayed and/or the prominence of the issue. Generally, the agenda-setting rationale does not examine issue framing unless both are mentioned explicitly.

Tied for the fourth most common theoretical rationale (9.5%, $n = 2$) are the health belief model (Rosenstock, 1974), cultivation theory (Gerbner, 1970), and the extended parallel processing model (Witte, 1992). Other theories used only once within the 22 studies included: social identity theory (Tajfel, 1974), theory of planned behavior (Ajzen, 1985), social exchange theory (Thibaut & Kelley, 1959), narrative theory (Fisher, 1987), and the sexual imagery model (Byrne, 1977).

For example, Greenberg, Rosaen, Worrell, Salmon, and Volkman (2009) examined media portrayals of eating and drinking on children's television shows. Within this investigation they employed both Bandura's (1986) social cognitive theory and Gerbner's (1970) cultivation theory in their efforts to gain insight into the problem of obesity in the United States. The role the media play in this problem has been investigated by a number of scholars, who generally find that the eating and drinking habits of TV characters are far from healthy. In this investigation, Greenberg and colleagues (2009) examined 50 children's shows, 50 shows targeted at 9- to 14-year-olds, 40 afternoon soap operas, and 50 prime-time programs and found reason for social critics to be concerned. Specifically, they observed that eating and drinking are common activities and foods considered unhealthy – foods containing oils, solid fats, and foods with added sugars (OFFS) – are particularly prevalent. These potentially problematic foods are typically eaten as snacks or treats and are quite commonly ingested on programs oriented toward younger viewers. They also found that the consumption of alcohol is customary on shows viewed by children aged 9 to 14 and that drinking often occurs as a social activity within the context of a celebration. Greenberg and colleagues also found few negative consequences for eating unhealthy foods or drinking alcohol, and observed social rewards associated with

drinking alcohol on these programs. Teens in particular are often shown characters that are drinking alcohol, and such drinking is often associated with partying and general merriment.

These findings by Greenberg and colleagues (2009) are interesting for a variety of reasons – not the least of which is that they illustrate that researchers need to recognize that media portrayals can impact audience members in different ways. From the perspective of social cognitive theory, the audience is more actively involved with the learning and/or imitating process. In the case of teens exposed to drinking, the paucity of negative consequences and the association with merriment suggest viewers can learn that drinking results in fun and few negative consequences. In the case of young children eating junk food, cultivation theory suggests children need not learn or even notice the relationship between the unhealthy behavior and its consequences. Merely being exposed to themes on television can yield the belief that overeating or eating in a less than healthy manner is not only acceptable, it is to a large degree the “American way of life.”

Other researchers also employed multiple theoretical models in their analysis of health portrayals. Quick (2010) employed media framing theory and the health belief model in his investigation of steroid use. Baek and Mayer (2010) employed Bandura’s (1986) social cognitive theory and Byrne’s (1977) sexual imagery model in their investigation of sexual imagery in cigarette advertising. Gold, Cohen, and Shumate (2008) used social cognitive theory (Bandura, 1986) and Fisher’s (1987) narrative theory in their examination of proscriptive models and evidence in smoking advertisements. Rains and Bosch (2009) used social exchange theory (Thibaut & Kelley, 1959) and exchange theory (Bagozzi, 1979) in their investigation of health website privacy statements. And, as was pointed out above, Greenberg and colleagues (2009) employed social cognitive theory (Bandura, 1986) and cultivation theory (Gerbner, 1970).

The remaining two articles employed three theories within their investigation. Noar, Clark, Cole, and Lustria (2006) used social cognitive theory (Bandura, 1986), media framing (Kahneman & Tversky, 2000; McCombs & Ghanem, 2001), and the extended parallel processing model (Witte, 1992). Wang and Gantz (2010) employed agenda setting (McCombs & Shaw, 1972), social learning (Bandura, 1986), and cultivation theory (Gerbner, 1970).

The use of multiple theoretical models is advantageous to the researcher because it allows more sophisticated content-analytic schemes to be employed. Researchers can use the theory, the previous research findings, and the known boundary conditions of the theory to fine-tune their categories. In addition, the use of multiple theoretical models allows researchers to pit different theories against one another. These competitive situations can produce significant insight into the validity of the various theories.

In addition to using multiple theories in their investigation, Baek and Mayer (2010) also employ a public policy argument in their examination of sexual imagery in cigarette advertising. While concerns about portrayals of sexual imagery and the dangers of smoking have long been of interest to communication scholars, this investigation

focuses on the legal arrangement known as the Master Settlement Agreement (MSA) to determine whether depictions of sexual imagery changed after the agreement. The MSA was signed in 1998 by the four major US tobacco manufacturers and the Attorneys General of 46 US states, prohibiting advertising and promotional practices targeting youth. The MSA was in principle an effort to restrict or limit the amount of cigarette advertising exposure to which the youth of the United States were subjected.

Baek and Mayer (2010) suggest that cigarette advertisers began to modify their techniques to incorporate more sexual imagery into the advertisements in an effort to encourage the purchasing of tobacco products without overtly targeting young people. The authors' concern was, then, to determine if sexual imagery in cigarette advertising had changed since the agreement was signed. The results of the investigation suggest that there was a significant increase in scantily clad female models after the agreement. Further, the incidence of advertisements containing sexually explicit material and ads depicting voyeurism increased after the agreement was reached. The authors contend that this change in the visuals of the advertising is an attempt to influence young people without violating the letter of the agreement.

Media Channels and Internationalization

Health communication scholars have begun examining an ever widening variety of different media channels in their efforts to document portrayals of illness and health issues. In the analysis of articles published in *Health Communication* between 1985 and 2005, Manganello and Blake (2010) found that 35% of the studies focused on magazines, 31% focused on newspapers, and 29% focused on television. As a point of comparison, seven articles (31.8%) published in *Health Communication* between 2006 and 2011 examined TV portrayals of health, six articles (27.3%) examined content found on the Internet, five articles (22.7%) examined health portrayals from newspapers, and four articles (18.2%) focused on health portrayals in magazines. Channel variety, however, is more than simply the addition of the Internet to traditional media channels such as TV, newspapers, radio, and magazines.

An example of channel variety can be found in the work of Wang and Gantz (2010). While the researchers examined television content, they focused on local news programs in four media markets rather than the more common examination of national programming. Wang and Gantz (2010) argue that local programming needs closer scrutiny than it has traditionally received because 56% of US adults consider local news programs to be an important source of health information and because little previous research has focused on local news programming. In this investigation, the authors examined 1,382.5 hours of newscasts on seven channels (the affiliates of ABC, CBS, Fox, NBC, UPN, WB, and Univision) in four different markets (a major market, a large market, a medium market, and a small Midwestern market) aired between December 2004 and June 2005. Just over 8% of the 40,112

news stories focused on health issues, which means that about 1.26 health stories aired every 30 minutes. About 46% of the stories were less than 30 seconds in length and 74.5% of all stories lasted less than 60 seconds. Another example of the increasing interest in a wider variety of media channels can be seen in the TV channels selected by Wang and Gantz (2010). The addition of niche cable channels and international channels to the more typical big three (or big four with the addition of Fox) again illustrates how media portrayal research is changing.

While differences in markets were observed – the Indianapolis market had fewer health stories than Terre Haute, South Bend, and Chicago – the headline findings come from the frequency of illness types. Mental health stories rarely appear on the local news and gerontological health stories were even less common. The illnesses depicted or presented in descending order were as follows: cancer (12.2%), heart disease (5.5%), flu (3.4%), obesity (2%), diabetes (1.2%), joint and tissue disorders (1.2%), and lung diseases (1%). The distribution of general health issues was as follows: physical illness (46%), healthy living (24.8%), health insurance, health law or health policy (12%), parents and children (6.8%), environmental health issues (3.8%), mental health issues (3%), and aging (0.7%). Very few stories contained contrasting viewpoints on issues but most stories were neutral in tone and unlikely to produce unwarranted fear or a disinclination in viewers to engage in further health information seeking.

A second example of an increasing variety of media channels can be found in the studies examining YouTube videos. Tian (2010) used media framing theory in her examination of organ donation videos on YouTube. Kim and colleagues (2010), on the other hand, examined smoking fetish videos on YouTube. Smoking fetish videos are those produced by individuals that promote or encourage smoking, and in which the smoking is associated with sexual behavior. These pro-smoking messages are often geared toward adolescents, who make up the largest portion of Internet users. Kim and colleagues (2010) noted that pro-smoking messages on the Internet are rarely regulated, despite criticism and regulatory efforts against smoking. They further note that most smoking prevention programs, which are addressed toward adolescents, emphasize education about the long-term health consequences of smoking, but ignore the short-term benefits experienced by youth. These short-term benefits include looking cool and sexy – which is, of course, exactly what the smoking fetish videos do so well.

Employing social cognitive theory, the authors examine the prevalence of smoking fetish videos on YouTube, document the accessibility of those videos, and describe portrayals of smoking and the models who smoke in those videos. Using the search term smoking on YouTube identified 139,000 hits. When narrowing the search to smoking fetish videos (those containing smoking and sex), a total of 2,200 videos (or 1.6% of all smoking videos) was identified. While videos that are flagged must be approved by the YouTube staff to ensure the viewer is 18 years of age or older, only 15% of these videos were not accessible to children. It appears that over 95% of the videos contained explicit portrayals of inhaling and exhaling tobacco as well as

models holding tobacco products. In just under 50% of the cases the models were shown lighting a cigarette (91%), cigars (3.2%), pipe (1.6%), or a hookah (.5%). Using the Motion Picture Association of America's (2005) scheme for rating content, only 40% of the videos would have been rated PG and 27.2% of the smoking fetish videos would have received a rating of R. And, again, these videos, unlike motion pictures, go unregulated on the Internet. Other recent content studies have examined other resources on the Internet for health portrayals, including Lapinski's (2006) examination of pro-eating disorder websites and Noar and colleagues' (2006) examination of safe-sex websites.

Scholars studying health portrayals did not ignore the fact that 60% of all teenagers pleasure-read on any given day (Rideout, Foehr, & Roberts, 2010) and many of those teens spend as much time reading as they spend playing videogames (Roberts, Foehr, & Rideout, 2005). In their quest to find out what those bookworms learned about health, Coyne, Callister, and Phillips (2011) examined alcohol and other substance use and abuse in adolescent novels. The authors used the *New York Times* Best Sellers List to identify 40 best-selling adolescent novels sold between June and July of 2008. Coding the 14,005 pages yielded a total of 357 incidents of substance use (including alcohol, tobacco, illegal drugs, and legal drugs). As expected, alcohol use ($n = 240$) was more common than all other substances combined (tobacco ($n = 79$), illegal drugs ($n = 35$), and legal drugs ($n = 3$)). Surprisingly, the most common reasons for substance use were habit or addiction ($n = 98$) and socializing ($n = 86$). Somewhat less frequent reasons for use were relaxing ($n = 55$), coping with stress and other difficulties ($n = 50$), and celebrating (9.0%, $n = 32$). The substances used in the stories were acquired by the user in 75% of the cases, and there were no consequences for substance use in 83% of the cases. Coyne and colleagues (2011) employed the general learning model (Buckley & Anderson, 2006) in this investigation to describe the mechanisms through which media portrayals may affect adolescent attitudes and behaviors. Unlike other models of media influence, proponents of the general learning model suggest the media can activate extant cognitions and cognitive scripts as well as create and strengthen those scripts over time. This investigation also points to an additional theory that has been used recently to guide health portrayals research.

As noted above, the broadening examination of health portrayals also includes a focus on international contexts. An interesting example of scholars examining international content is Liu, Liu, Xiao, Cai, and Xu's (2010) study of depictions of skin cancer in Chinese newspapers. Liu and colleagues content-analyzed 134 articles about skin cancer published in Chinese newspapers between 2000 and 2007. The articles represent 1.8% of the articles found in the database focusing on cancer; the number of articles about skin cancer increased from 10 articles in the year 2000 to a high of 35 articles in 2006. The most commonly discussed type of skin cancer was melanoma – discussed in just over 38% of the articles; treatment of skin cancer was discussed in 41.8% of the articles analyzed.

In an effort to strengthen our contention that scholars are looking at a wider variety of channels, an analysis of articles that were not published was also performed.

Robinson and Agne (2010) examined 99 articles that were rejected for publication in the journal *Health Communication*. From this inventory of articles that were not published, a list of health portrayals topics was compiled. In some cases the authors of these manuscripts were asked to make revisions and declined, and in other cases the articles were rejected by reviewers. Clearly, the articles examining health portrayals focused on a wide variety of health issues and channels. Some of the more interesting channels investigated by the researchers include: English-language newspapers from India, results from Google searches, Japanese newspapers, medical tourism websites, and Japanese manga or graphic novels. This list is not intended to be exhaustive. We applaud the authors for their creativity, and are pleased to report that in several cases the articles have been subsequently published in *Health Communication* or elsewhere.

The Big Picture

Communication scholars and researchers have long been interested in the way health issues are portrayed within the media, and it appears that such interest has not waned. The argument that health communication scholars have begun studying an expanding list of illnesses and health issues has been made but certainly not decided here. Examination of other research publication venues and even conference presentations will need scrutiny, and the results of those analyses will need to be compared with historical data on health portrayals.

New technologies such as the Internet have also generated new channels and research opportunities (e.g., Facebook, blogs, YouTube, and websites). Those channels were not available prior to the widespread adoption of the Internet. Perhaps even more importantly, these new channels allow media content to be produced by sources other than the media conglomerates that once held the reins to the mass media. These technological innovations also make the study of traditional media channels such as newspapers or magazines much easier and in many cases much easier for sampling. Further, the availability of these materials online has in some cases made identifying search terms far easier than manually examining print materials page by page. In fact, historians may one day describe this time as a renaissance period for scholars interested in studying health portrayals.

It is clear from the analysis of health portrayals that the widespread adoption of Internet-based technologies contributes to the examination of new health concerns. For example, before the advent of the Internet, scholars interested in analyzing pro-eating disorder content would have had a much more difficult time finding the content to analyze. Concern about such portrayals would have been far less because the content would not have been readily available as such websites make that information today. Similarly, the thought of trying to publish a content analysis of smoking fetish home movies gives a researcher pause. Again, access to the content would have

been difficult and the small opportunity for audience exposure to such materials would all but ensure such study would never have been considered. YouTube videos demand scrutiny by mass media scholars because home movies are now viewed by so many people. For example, in 2010 the first five games aired on ESPN's *Monday Night Football* averaged approximately 11 million households, with 15 million viewers watching these games (Zurawik, 2010). Those are *great* numbers – the kind of ratings of which a cable network dreams. For comparison's sake, however, the original viral video commonly referred to as the *Star Wars Kid* was viewed some 20 million times between 2003 and 2006 (Wei, 2010). The video was so popular that many variations of that film clip were developed, and the many variations of that video had been viewed some 900 million times during the same time frame (Wei, 2010). Current estimates suggest that the video and its many variations have been viewed over a billion times (Wei, 2010).

In some cases, such as portrayals of cloning or food irradiation, the particular health issues result from technological development. In other cases technological developments simply make niche content (e.g., smoking fetish videos) widely available, more widely consumed, more amenable, and more viable as a health topic for researchers. In fact, the widespread proliferation of TV channels has seemingly contributed to a leveling of the playing field in the pursuit of gaining an audience. To give this contention some detail and context, consider that when the Nielsen ratings began in 1950, the average home had one TV set while in the year 2010, well over 80% of all homes had more than one TV and, in fact, over 30% of all homes reported having four or more TV sets (Godinez, 2010). Similarly, in the 1950s the average household received three TV channels (Godinez, 2010), while in the 1970s the average household received about 10 TV channels, and in 2010 Nielsen data suggest the average household received a whopping 118.6 channels (Marketing Charts, 2010). The proliferation of TV channels and TV sets within the home allows viewers within a single household to watch different programs. During the 1970s the three TV networks, for example, accounted for about 95% of the total audience and today less than half of the TV programming consumed can be found on a network (Harris, 2008).

The implications of channel proliferation to studying health portrayals are many and not lost on scholars and researchers. Channels attracting an audience that once was deemed as secondary to network TV or the highest rated magazines or newspapers must now be more closely considered as sources of health information. Leydon and colleagues (2000), Mills and Davidson (2002), and others have found that television, newspapers, and magazines are primary sources of health information for many people. Patients are also employing the Internet in their quest for health information. For example, approximately 75% of all US citizens use the Internet (USC, 2004), and 79% of these users report having searched for health information online (Fox, 2005). In fact, over 50% of all US Internet users report having looked for information about specific diseases or medical problems, certain medical treatments or procedures, and diet, nutrition, vitamins, or nutritional supplements at one time

or another (Fox, 2005). The fact that people use the mass media for health information further strengthens the argument for studying a wide array of health issues. In fact, the further a health issue is from the mainstream, it is arguable, the more reliant or dependent the consumer is on a particular source of information (Ball-Rokeach & DeFleur, 1976; Robinson & Tian, 2009). This realization suggests that scholars should focus on a wide variety of media channels in their efforts to describe health portrayals.

Further, Dutta-Bergman (2004) suggests that media usage/consumption is not a zero-sum game. Instead, he argues that consumers of the media will employ the various channels in a complementary fashion. He suggests people interested in sports will watch sports programming on television, listen to sports programming on the radio, read about sports in newspapers and magazines, and surf the Internet for information about sports. Similarly, people interested in health information will actively seek out information from any channel that they believe will provide that information. Support for the contention, labeled media complementarity theory, is growing, and the research suggests that audience members seeking out information from the media (particularly health information) are guided by need and interest (Tian & Robinson, 2008a, 2008b).

Scholars employing media complementarity theory as part of the basis for their study, then, have the beginning of a rationale for studying health portrayals across media channels. If people use the media purposefully, it is reasonable to examine what they will find about a particular health issue across channels. Obviously, this also suggests that scholars need to consider and perhaps reconsider the commonly used practice of sampling by channel.

In years gone by, scholars may have been hesitant to undertake a large-scale project of local news, such as that described above by Wang and Gantz (2010), for fear of reviewer criticisms about the sample. Studying content from a variety of different media channels is also advantageous to health communication scholars by allowing additional insight into the relative importance of channel characteristics on those media portrayals. For example, scholars focusing on television news programs are likely to find that whether or not a health issue is covered may be determined by the availability of video to air along with the story. This notion of channel bias has been discussed in great detail within the mass communication community, and such bias can impact what issues are aired and how they are depicted to some degree (Cantor, 1980).

Similarly, scholars focusing on time-bound channels such as newspapers are likely to find an event bias (Boorstin, 1961). Stories about health issues are more likely if there is a precipitating event that can be described within the story. Hunger is hardly news, but a hunger strike or famine may be news. By studying media content from different channels, scholars can begin parsing the differences in channel characteristics and other determinants of how media content is portrayed. In short, scholars examining health portrayals across a variety of different channels can begin to parse the effects of channel properties, editorial policies, and market economics. Stories

that are told in the same way regardless of channel are interesting, but finding that stories are told differently depending on the channel would be even more interesting. Stories that are told in the same way in channels with and without editorial control certainly deserve a different kind of attention than stories that are told differently depending on the channel on which they are found. New media channels such as blogs are undoubtedly constrained in many ways – just as the content aired on more traditional media channels is constrained by time and space, advertising interests and costs, and social and political pressures. However, by studying the content differences in these disparate channels, insights into the similarities and differences that exist may be identified. Examining how health issues are depicted in different countries may assist us in better understanding the impact of factors such as culture, economics, government regulations, and social pressures on media portrayals. Likewise, examining how health issues are depicted in different countries may also assist us in better understanding the impact of media portrayals. Health issues that are treated differently in different countries would be expected to produce difference effects within audience members. The first step, however, is the mapping of these health portrayals.

Not unrelated to the proliferation of media channels being examined by health portrayals researchers is the increasing diversity in the types of health issues being examined. The examination of such a multitude of health issues provides scholars an interesting opportunity to better understand health attitudes and knowledge, the media, and culture. Using these disparate health issues as a window into the culture may shed some light on how and why the media portray particular issues. For example, a scholar looking at how eating disorders are framed might be able to make interesting comparisons with the way HIV/AIDS is portrayed. Similarly, a scholar looking at eating disorders might examine how obesity is framed relative to anorexia nervosa or bulimia. Such an analysis takes content analysis of health portrayals from a purely descriptive endeavor – based primarily on the opportunity for audience learning – into the realm of interpretation and culture studies. Commonalities in the way diverse health issues are portrayed can provide insights into whether the portrayals are a function of the channels, misunderstanding of the health issue, literary license, or other societal forces. Meta-analytic techniques dividing health portrayals into acute and chronic illnesses may shed light onto the why and how health issues are depicted.

Of course heightened audience awareness of health issues can produce patients who are actively involved in their healthcare, and it can also lead the hypochondriacs among us to new heights of concern. Health portrayals researchers need to be ever mindful that content analysis needs to be more than an exercise based on the simple counting of things. What “more” coverage of something indicates is a debatable issue, but at the very least content analysis needs to be based in a strong theoretical rationale.

Manganello and Blake (2010) found that researchers examining health portrayals are likely to employ a theoretical rationale for their study. The theory can and

should be used as the basis for conducting the content analysis as well as the basis of the content-analytic category scheme employed within the investigation when possible. For example, a researcher analyzing how cancer patients are portrayed on television may use Cutrona and Russell's (1990) work as a basis for coding the types of social support they receive within a medical drama. The researcher then starts the research with a commonly accepted set of descriptions of the types of social support. The availability of extant operational and conceptual definitions of key variables can assist the researcher by ensuring particular types of social support do not go unexamined. Previous social support research can be translated into useful and theoretically significant content categories. This allows the researcher to extend the theory as well as map the portrayals of health within the media. Obviously, the use of more than one theory may allow the researcher to generate even more sophisticated content-analytic schemes and ultimately make such research more valuable. Finally, the use of Cutrona and Russell's (1990) work may encourage the researcher to examine how patients provide social support to others – an opportunity that patients welcome. This kind of direction is why scholars should use theory and research in the development of their category systems. The need to provide social support to others is precisely the kind of category that might go unexplored without consideration of such theoretical work as that of Cutrona and Russell (1990).

Scholars frequently use more than one theoretical position as the basis for their study and/or the basis for their content analysis scheme. The use of multiple theoretical perspectives potentially allows the development of a more nuanced content category scheme. For example, a researcher might use Cutrona and Russell's (1990) typology to identify the different types of social support provided and Bandura's (1986) social cognitive theory to provide a theoretical basis for coding the consequences of social support. In this way the researcher can describe how social support is portrayed in the media and also identify character responses to social support.

In addition, the use of multiple theories allows scholars to examine the relative benefits of different theoretical perspectives – particularly in content studies that also gather audience effects data. For example, a researcher might examine how the media portray health issues from the agenda-setting perspective. Such research would focus on frequency of portrayals. Some researchers go beyond simple frequency counts and code the portrayals for prominence. Other researchers examine the same issue from the agenda-setting perspective and also incorporate media framing theory in the design of the study. For example, a news article can frame alcoholism as a health issue or it can portray alcoholism as a social problem or even an individual psychological problem. For example, is drinking framed as something people do to celebrate or something they do when things go bad? The frames (e.g., alcoholism is a social problem or a health issue) lead the audience to view alcoholism as a particular kind of problem – based on the way it is portrayed in the media.

Still another researcher interested in media portrayals of alcoholism might use agenda setting and priming theory as the basis of their study. They would do this to determine the affective responses likely to occur within the audience members as they are exposed to the health issue. Is the issue of drunkenness portrayed as a “joke or a good time” or is it portrayed as a tragic problem? Researchers might use priming here instead of framing because they want to know the kinds of affect the person will associate with excessive drinking.

Still another researcher might couple social cognitive theory with agenda setting to see what the audience learns from the characters that they could subsequently imitate. And yet another researcher might use agenda setting and cultivation theory as a way of looking at the issue of alcoholism on a larger, cultural level. This researcher might be interested in determining if the media portray alcoholism as an individual problem or a problem that will be solved by the government, the medical profession, or some other institution. Has the problem of alcoholism been medicalized by the media or has the government been portrayed as paternalistic and the caretaker of the citizenry?

At first blush these studies seem very similar, but in actuality all that they share is a focus on portrayals of alcoholism. In all of these cases, researchers are basing their work on the fact that the audience is learning or being conditioned by media portrayals. What they learn and how they learn it, however, can differ dramatically from theory to theory. However, the use of multiple theories in a study focusing on health portrayals need not employ theories that are to some degree variations on a theme.

For example, a content analysis examining portrayals of healthcare professionals might use social cognitive theory to determine what viewers/readers learn from the media about doctors and nurses. A second theory, however, such as Knapp's (1984) relational development model, might be useful for examining how the patient-physician relationship develops. Or the scholar might use the pragmatic perspective of Watzlawick, Beavin, and Jackson (1967) as a way of getting at the mechanisms that TV characters use to develop relationships with audience members. Both of these theories are quite far afield from a learning model and could shed interesting light on health portrayals.

Finally, it is important to keep in mind that media portrayals are a function of a multitude of factors, including culture, storytelling convention, history, economics, time and event biases, current events, and technological development, to name but a few. While these considerations are outside the scope of this chapter, they are offered as a reminder for scholars to focus on the specific details of the portrayals, the impact of such portrayals on health decisions made by audience members, as well as broader societal concerns. The study of health portrayals is an important area of research that needs to be grounded theoretically and less an exercise in pure description. It is hoped that the trends identified within this chapter provide some insights and some direction for future research. We believe studying media content in a variety of different ways is important because it helps establish the fact that content is indeed reflective of something beyond simple chance in the way it is portrayed.

Canadian (Re)Presentation

Media, First Peoples, and Liveness in the Museum

Miranda J. Brady

ABSTRACT

This chapter explores relationships between media and Indigenous identity construction in the Canadian Museum of Civilization's (CMC) First Peoples Hall (FPH) through an analysis of place-based media and archival research. It explores the specific historical, economic, and pedagogic contexts influencing media adoption in the CMC and FPH, and argues that while the museum attempts to forward a progressive curatorial agenda through Indigenous collaboration and new media adoption, the CMC has yet to fully explore the contemporary implications of Indigenous representation. Finally, this chapter questions celebratory discourses of new media as a panacea for representational maladies and the idea of representation itself as a panacea for Indigenous concerns.

Large-scale, centralized museums for general audiences in settler societies have been shifting due to new museological understandings, norms, and practices, where the question of participation has become central. National museum projects dedicated to Indigenous topics around the world have been shaped by this transformation from New Zealand to Canada. "Active collaboration and a sharing of authority" have become the norm in many Indigenous exhibitions (Clifford, 1997, p. 210). While mostly non-Native curators and anthropologists possessed the cultural legitimacy to

interpret Native histories in large-scale museums of the past, Indigenous people themselves now play a greater role in the curatorial process in many contemporary museums; place-based media have increasingly been central in evidencing their participation (Brady, 2011a, 2011b). Over the past 30 years, developments in place-based media technologies and shifts in Indigenous representational practices have facilitated new relationships between Indigenous identity construction, media, and the idea of active participation on behalf of both non-Native visitors and Indigenous subjects.

The Canadian Museum of Civilization (CMC, 1989), a revamped version of the Canadian Museum of Man, and its First Peoples Hall (FPH, 2003) emerged amongst the debates centered on issues of Indigenous representation, and they were products of their time. Increases in Indigenous consultation and pedagogic discourses promoting active learning greatly influenced the CMC, along with pressures to stay competitive with other social institutions. Each of these factors justified the adoption of new media technologies in the museum. CMC founders attempted to push the museum into the twenty-first century through exhibition practices and cultural policies that were seen as progressive for the 1980s and 1990s, and planners were highly motivated to demonstrate the museum's relevance as a modern institution through the integration of new representational approaches and technological trends. In particular, museum leaders were fixated on the idea of liveness and the pedagogic potential of interactivity.¹

The enthusiasm about the liveness enabled by new media in the 1980s and 1990s, though reinvigorated by contemporary technologies, was not new. As Jeffrey Sconce (2000) suggests, such discourses date back to the mid-nineteenth century with the advent of the telegraph, the telephone, and wireless communication. The television was discussed in similar terms (Spigel, 1992, 2001). The idea of liveness was a way of imagining the West's ingenuity and the conquest of space. The ideals of achieving "global presence" and simultaneity continued to be important during the Cold War and the Space Race, especially in discourses constituting the satellite (Parks, 2005, p. 23). While simultaneity had been a popular concept in the 1960s with Telstar I's first live trans-Atlantic broadcast (Parks, 2005), the same idea was popular in museums of the 1980s as satellite use and the computer became more accessible. In museums of the 1990s, discussions about the World Wide Web reproduced the ideals of global presence and what can be characterized as the "rhetoric of the electrical sublime," which suggests that "communication, exchange, motion brings humanity, enlightenment, progress" (Schivelbusch, 1978, cited in Carey, 1989, p. 208). Canadian museum professionals in particular were influenced by icon Marshall McLuhan (1964) and the notion that media could facilitate a global village (MacDonald & Alsford, 1989).

The concept of liveness maps onto Indigenous museum representations in particularly interesting ways. In older museum forms, this meant a highly contained bringing to life (Wakeham, 2008) while newer museums have extended this idea to include live communication. Museums have a long history of utilizing media in attempts to create a live experience for visitors as they learn about Indigenous peoples and cultures. In natural history museums of the past, this liveness was presented

through the (re)animation found in life-sized dioramas, mannequins, and taxidermic animals, where Indigenous people were suspended in historic live-action poses, but with the assumption that they had been pacified or driven to extinction. Pauline Wakeham (2008) discusses this tradition in *Taxidermic Signs*. According to Wakeham, museums of the early twentieth century self-fashioned as benevolent salvagers who preserved Indigenous cultures to save them from apparent imminent oblivion. They did so by locating Indigenous people in the past alongside the reanimated carcasses of deceased animals and appropriated cultural patrimony. Wakeham identifies the imperialist nostalgia and perverse colonial voyeurism in freezing colonial subjects in a pre-contact, “suspended pastness” (2008, p. 17). Museums demonstrated colonial power and the “purportedly inevitable extinction of an inferior race” through the act of representation itself, by reanimating Indigenous people under Eurocentric terms (Wakeham, 2008, p. 20). Wakeham suggests that taxidermic semiosis carried over to Indigenous representation in other cultural forms like cinema, which also has a history of salvage impulses in early documentary, where Indigenous people were staged outside of technological, Western contexts (Raheja, 2007).

Museums like the CMC seek to avoid colonial voyeurism through Indigenous participation and by placing Indigenous people in modern contexts. However, the question remains whether efforts to recreate liveness for mostly non-Native audiences through static, prerecorded testimonials from disembodied constituents are really that different from past attempts at reanimation. In both cases, the focus is on creating a live experience for a general audience in accordance with normative museological practices and with the limitations of popular place-based media. In both cases, the focus is on the experience of the visitor.

Regardless of attempts to break away from outmoded museum practices, the contemporary Indigenous museum has been criticized for continuing a number of long-standing and problematic traditions. According to critics like Eva Mackey (2002), Indigenous identity is used instrumentally in state institutions like the CMC where “officially sanctioned self-representation” helps to reaffirm national identity (p. 83). Mackey writes, “Aboriginal people are necessary players in nationalist myths: they are the colourful recipients of benevolence, the necessary ‘others’ who reflect back white Canada’s self-image of tolerance” (2002, p. 2). Mackey suggests that such self-affirming mythos distracts focus from the ongoing problems faced by Indigenous people and the state’s responsibility to intervene.

Similarly, other national museums like the Smithsonian’s National Museum of the American Indian (2004) have been criticized for their efforts to reach mostly non-Native audiences, rather than Native “constituents” (Brady, 2008, 2009), and some scholars have questioned whether large-scale, centralized museums actually benefit Indigenous people (Boast, Bravo, & Srinivasan, 2007). Scholars have also pointed out that prerecordings of oral traditions do not allow for audience adaptability, which is central to oral performance (Verran & Christie, 2007), while others cite the problems occurring when Indigenous people lose control over interpretive contexts as their cultures are being presented to general audiences (Isaac, 2007).

Museums adopt place-based media in attempts to represent Indigenous identities to general audiences and to articulate a sense of Indigenous liveness, which is a way of self-fashioning in juxtaposition with older museum forms, a phenomenon Wakeham describes as the “meta-museum” (2008, p. 65). As Raymond Williams (1974) argued, the cultural forms of media help to shape and guide the ways in which they are used and understood. As the following passages argue, there are limitations and opportunities for media use in articulating Indigeneity. While the inclusion of new media technologies can suggest that museums are in tune technologically and that Indigenous identities are contemporary rather than trapped in the past, there are broader implications to their use and the technocratic impulses prescribing them. While the FPH was a response to problematized museum practices of the past, the implications of new Indigenous representational technologies demand further consideration. Also worthy of reflection is the priority placed on representation itself and the degree to which other important issues go unaddressed (see Isaac, 2007; Lonetree, 2006).

The following passages explore such issues within the context of the CMC by providing an overview of the conditions shaping the museum’s opening in 1989, FPH planning, and media adoption. A study of FPH media will demonstrate the ways in which planners conflated discourses of representation, pedagogy, and competition. A brief discussion about the exhibit’s reception by the popular press, Indigenous newspapers, and academic journals will provide further insight into the ways in which these discourses were reproduced and experienced in the museum. Finally, this chapter will conclude by addressing the implications of new media adoption and the focus on visitor experience and representation in Indigenous exhibitions as well as the relationships between Indigenous identity construction, the ideal of liveness, and the use of place-based media in the CMC and its First Peoples Hall.

Fashioning a “Museum for the Twenty-First Century”: From Artifact Collection to Information Utility

As media technologies saw increased use in public spaces of the 1980s and early 1990s, Canadian museums and other heritage institutions faced a crisis (MacDonald & Alsford, 1994). Nonprofit institutions like national museums had limited budgets, and the increasing digital divide created by new educational technologies threatened obsolescence for those left behind. Leaders at the Canadian Museum of Civilization embraced the technological zeitgeist as they planned the opening of their “museum for the twenty-first century” across the Ottawa River from Canada’s capital city and Parliament Hill (CMC, “Written in the Stone”). Taking their cue from other museums and commercial institutions like Disney’s Epcot Center as well as popular

philosophies in communication and pedagogy, they envisioned a media-rich museum (MacDonald & Alsford, 1989).²

Leading the technological development for the CMC was special projects manager Stephen Alsford, who wrote and spoke prolifically on the topic of media technologies and museums along with inaugural CMC director George MacDonald. Alsford was a strong proponent of new media acquisition, and he suggested it would help the CMC keep pace with the many other institutions vying for the attention of potential visitors (Alsford, 1991). The inclusion of technology was in line with the museum's modernizing attempts, including the construction of its new facilities in Gatineau, Quebec, and the institution's renaming from The Museum of Man to the less gender-biased Museum of Civilization. The CMC's opening provided the opportunity for the institution to transform its identity and, as a national museum, it would reflect broadly on Canadian identity as well. Indigenous themes were closely tied with nation throughout the museum, from the curvilinear building itself, designed by the Blackfoot/Métis architect Douglas Cardinal, to the exhibits, including the Grand Hall, which showcased a number of traditional Indigenous cultures. Plans also began for the First Peoples Hall, which would address more contemporary Indigenous topics, but they were postponed until after the museum's opening.

Both MacDonald and Alsford were determined to push the CMC into the next century through technology. However, it was difficult for CMC staff to make decisions about the newly available and costly media with which they had limited knowledge. There were a number of new devices being marketed for exhibition and data management, including early interactive computer kiosks, community networks and satellite connections with other cultural institutions, videodiscs as well as the technologies for creating them, and lasers capable of producing digital models. The wow factor was high, and shiny vendor brochures promised "interactivity" and improvement of "problem-solving skills."³ One company boasted that with its kiosks, "a student's ability to interact directly and immediately with the 'source' of instruction more closely parallels 'live' education."⁴ The same kind of language about interactive education was mirrored in the discourse of museum planners, who made pedagogic justifications for technology adoption. For example, CMC staff wrote, "What is especially interesting with these products is the ability of the viewer to control and direct the course of a given scenario and realize its outcome based on his or her earlier decisions."⁵ Stephen Alsford collected information on such interactive devices and referenced their use in the British Museum of Mankind's *Living Arctic* exhibit, through which visitors determined the fate of Indigenous Arctic and sub-Arctic hunters by making a series of choices via digital kiosks. Prerecorded, edited video footage of Indigenous actors helped to create a more realistic feel for the educational tool (Interactive Video, 1988).

Similarly, Alsford collected information on the JASON Project, another interactive program that offered a sense of liveness, connecting scientists and educational institutions via satellite. The JASON project used robots to film underwater sites like sunken ships from the Battle of 1812. The images were downlinked to Turner Broadcasting

Systems (TBS) in Atlanta, where they were made into a final production, which was broadcast simultaneously to subscribers. The effect of liveness offered by JASON excited museum planners. Not only would visitors connect with underwater sites via “telepresence,” but JASON would also provide networking possibilities with other institutions across Canada and the United States.⁶

The adoption of such technologies was justified by a popular pedagogical turn toward active, experiential learning philosophies. The idea of real-time technologies, which facilitated interaction with visitors, was grafted onto such ideals. For example, CMC consultant Tom Sherman, an artist/performer who utilized electronic media in his work, encouraged the museum to adopt technologies to enable a live exchange of information with visitors. He argued,

The Museum should be as open to the reception of information from its visitors as it can possibly be. Storage, design and playback can only be valuable processes as the natural residue of a living communications environment. To place an emphasis on the creation of a Museum which only transmits information one-way is ill-advised.⁷

Regardless of the celebration of dialogic models of pedagogy and communication amongst museum administrators, there was palpable reticence amongst CMC staff, who did not have the expertise to operate or maintain new educational devices. The rate at which first-generation technologies like interactive touch screens would become obsolete was also unclear, leading to further hesitation. Alsford was frustrated with sluggish attitudes toward technology adoption as the CMC’s debut neared, and he wrote to MacDonald,

I would like to see our people take a more serious attitude towards developing/acquiring a real interactive video learning module in time for opening! Instead there seems to be a “let’s wait around and see if anything better comes on the market in the next few years” attitude. This won’t win us any brownie points as a museum for the Information Age.⁸

As Alsford’s comments suggest, he, like many in the museum industry, were feeling the pressures to make museums more appealing to general audiences through new media. Limited funding factored into building concerns over the museum’s distracted audience, and Alsford and MacDonald worried about the tendency of museums to act as followers when compared with other institutions and the “commercial marketplace” (Alsford, 1991, p. 13). Like Marshall McLuhan (*Playboy* Interview, 1969), they believed that resistance to new media was futile, and the only way to succeed was to accept, if not embrace, the maelstrom. “21st century audiences” encountered high-technology devices routinely, not only in theme parks but in banal spaces in their “schooling, recreation, and work experiences” and had come to expect them in public places (MacDonald & Alsford, n.d.). MacDonald and Alsford saw the “entertainment industry” as a “competitor with the museum world for the discretionary leisure time of the public,” and the “power of television, film and video to inform,

sway opinions and shape cultural consensus” was “enormous” (MacDonald & Alsford, 1991, p. 308). They wrote,

The question is whether we can persuade the public to prefer our high-integrity information products to the products of institutions motivated primarily by profit. To do so, we will often need to adopt the tools and techniques those competitors have led the way in utilizing. (MacDonald & Alsford, 1991, p. 308)

Surely, such a philosophy about the education/entertainment crossover justified the inclusion of the IMAX theater, which would help to supplement the CMC’s federal funding (Riley, 1996).⁹ The museum was the first in the world to integrate a dome with IMAX screens measuring seven stories, allowing for 180 degrees of vision and including 13,000 watts of power (CMC, “About the Theatre”).

In addition to gee-whiz technologies like the IMAX theater, the “tools and techniques” of competition consisted of the commercial model in which the museum now saw itself. In that vein, CMC leaders suggested that museums consider information, rather than artifacts, as their “primary resource, or commodity” (MacDonald & Alsford, 1991). They argued that this perspective positioned museums centrally within the information age, “in which information-based services are expected to be a key to economic prosperity and to social status – two things necessary, in the real world, to museums to ensure their effectiveness, if not their survival” (MacDonald & Alsford, 1991, p. 307). The museum, or “information utility” (MacDonald & Alsford, 1991), was more than just a public service, according to the museum’s leaders; it would need to compete for audiences.

The discourse of competition occurred frequently in planning documents and reflected the CMC’s desperate efforts to remain relevant amongst very different types of institutions. While the CMC certainly took its cues from other museums, it also compared itself with profit-driven players with much larger budgets. In a 1983 meeting, CMC staff noted that Disney’s Epcot Center had 127 media units, five of which were interactive, or touch screen.¹⁰ While many US institutions enjoyed the financial support of corporate sponsors, and the differences in orientation between the institutions were obvious, CMC leaders believed they were fighting the good fight for the hearts and minds of the visiting public. If the Epcot Center symbolized the American dream, the CMC would have to prove that Canada had not been left behind. However, as will be discussed in the next section, the CMC’s priorities shifted as debates over Indigenous representation transformed the museum landscape.

Museum Practice and Indigenous (Re)presentation

Discussions about the CMC’s First Peoples Hall (FPH) began as the Museum of Man was making its transition into the Museum of Civilization (McGhee, cited in

McCarthy, 2000a), though it would be nearly 14 years after the opening in 1989 before the FPH was completed. Around the same time, controversy over Indigenous exhibition came to a head with the infamous Glenbow Museum exhibit, *The Spirit Sings: Artistic Traditions of Canada's First Peoples*. Contention over the exhibit along with global trends greatly influenced plans for the FPH, and the CMC decided to scrap initial ideas begun in the 1980s, deeming them “too traditional” (Lofaro, 2003).

The Spirit Sings was part of the 1988 Winter Olympic art program and featured a historical theme relating to the “cultural and artistic heritage of Canada,” in which Indigenous artifacts and cultures were on display (Wilson, 1992, p. 6). None of the six guest curators involved in the exhibit were themselves Indigenous. Although response amongst museum professionals centered on the exhibit’s lack of Indigenous consultation, a number of other issues had actually fueled tensions with Indigenous groups. The Alberta Lubicon Lake Band of Cree was in a long-standing struggle with the Canadian and Alberta governments over recognition of their ancestral lands, while Shell Oil, which had been a major corporate sponsor of *The Spirit Sings*, was exploring the same contested lands for natural resources (Wilson, 1992, p. 6). The band protested the exhibit to draw attention to their claim and concerns over health and environmental degradation. *The Spirit Sings* came to stand for all that was wrong in the world of Indigenous exhibition. However, while response to the exhibit in the museum community addressed complaints about Indigenous participation in curation, it overlooked the original grievances of the Lubicon about their land claims and Shell Oil. The focus shifted primarily to issues of representation rather than the other major underlying concerns.¹¹

The CMC was heavily involved in shifting museological practices as employees like archaeologist Robert McGhee worked with Indigenous groups to rethink collaborative models, and the museum sponsored a symposium on Indigenous curation. A related Task Force on Museums and First Peoples sponsored by the Assembly of First Nations (AFN) and the Canadian Museums Association (CMA) worked from 1989 to 1991 on potential curatorial solutions. Its mission was to “develop an ethical framework and strategies by which Aboriginal peoples and cultural institutions can work together to represent Aboriginal history and culture” (Task Force on Museums and First Peoples, 1992, p. 1). A number of recommendations resulted from the symposium and the AFN/CMA Task Force and were outlined in a book titled *Turning the Page*. The Task Force strongly recommended that there be (1) increased “involvement of Aboriginal peoples in the interpretation of their culture and history by cultural institutions”; (2) “improved access to museum collections by Aboriginal peoples”; and (3) “the repatriation of artifacts and human remains” (Task Force on Museums and First Peoples, 1992, p. 1). In addition, the Task Force recommended “consultation be considered a necessary part of the development process of any exhibition or representation of First Peoples in museums” (p. 19).

Several CMC employees, who had been involved in the AFN/CMA Task Force, were also key to the planning of the FPH, which not surprisingly reflected many of the recommendations laid out in *Turning the Page*. In 1991 CMC Director George

MacDonald dedicated the 20,000-square-foot space behind the museum's Grand Hall to the FPH (Harrison, 2003).¹² The Grand Hall, one of the museum's inaugural exhibits, showcased Indigenous cultures, while the FPH would cover more contemporary topics. The latter exhibit would reflect newer museological trends, demonstrating both ideological and technological updates to the museum. As recommended by the AFN/CMA Task Force, Indigenous consultation was key to FPH planning, and Indigenous participants served on several committees including the Architectural Team, the Curatorial Team, the Support Team, the Advisory Committee, and the Consultation Committee, which was assembled based on suggestions from curators (McGhee, cited in McCarthy, 2000a, p. 19). In addition, Indigenous employees like Plains Cree/Blackfoot artist Gerald McMaster, who served as a co-chair early in the process, were key to the shaping of the FPH. Planning would take more than 10 years, and while a core group of Indigenous consultants would maintain a fairly consistent presence throughout its development, the involvement of several CMC employees was more erratic as some, like McMaster, left the museum for other opportunities (Harrison, 2003; Phillips, 2006).

The Consultation Committee assisted with content themes, principles, and architectural guidelines.¹³ "Principles for Development" reflected the focus on representation and Indigenous participation and suggested, "The Hall will present the history, culture, and current realities of aboriginal peoples in the voice(s) of aboriginal peoples."¹⁴

The FPH had very ambitious representational goals and, according to Consultation Committee notes, planned to represent "All First Peoples of Canada [...] including those following traditional and contemporary paths, and living in both rural and urban environments."¹⁵ In addition, the CMC was quite concerned with disrupting misconceptions about aboriginal people such as the idea that they are "remnants of an obsolete way of life."¹⁶ Media technologies played a central role in serving the goals outlined by consultation committee members, especially the articulation of a sense of Indigenous voice and the use of contemporary Indigenous testimonials to disrupt stereotypes, many of which had been developed through popular media.

The FPH Master Plan suggested that media would be central to representing Indigenous people in contemporary lifestyles, starting with the Welcome Area into the exhibit. It suggested that the Welcome Area "should be heavily dependent on electronic audio-visual elements, which are appropriate for an exhibit stressing the contemporary nature of First Peoples societies."¹⁷ Moreover, the document suggested that the inclusion of media would make for convenient updating to include topical issues. Similarly, Mohawk Consultation Committee member Wendell Beauvais suggested this area would "affect the mood" of the visitor and "should provide the visitor with a tactile experience that will set them up for the visit through the hall proper."¹⁸

The use of media was consistent with the visions laid out by CMC leaders George MacDonald and Stephen Alsford (1989), who clearly celebrated new media and the pedagogic and technological discourses of liveness and interactivity. As the next

section will discuss, these technological foundations were conflated with Indigenous representational goals in the FPH, which were centered on demonstrating participation in representation and contemporary lifeways.

Media Technologies and the First Peoples Hall

The CMC's focus on liveness, experience, and Indigenous (self-)representation is apparent beginning with the FPH Welcome Area. When compared with the Grand Hall, which visitors must traverse before entering the newer exhibit, the space is much darker, and this becomes immediately clear as visitors move through the entrance. While the Grand Hall is lined with 365 ft × 50 ft floor to ceiling windows, allowing for views of the Ottawa River and Parliament Hill and for ambient lighting to flood its open spaces, the FPH is much more cavernous and curves into a number of winding, partitioned-off areas (CMC, "Grand Hall"). While the Grand Hall is more structured around life-sized props, including totem poles and six replicas of Northwest Coast homes built from the nineteenth and early twentieth centuries, new media technologies are more central in the First Peoples Hall for creating the sense of liveness discussed in earlier planning. According to Alsford (1991), such props or "environmental reconstruction" encouraged "role-playing" amongst visitors, which he believed promoted cultural understanding. The Grand Hall's focus on traditional culture and its inclusion of very few updated media devices juxtapose with the flashing images of the FPH's screens, which feature testimonials from contemporary Indigenous people against the backdrops of their homelands. One of the important functions of the FPH's mediated texts is to demonstrate Indigenous participation in narrating the exhibit in the first person.

A large screen lining the dim FPH Welcome Area is one of the first features coming into view through the entrance, and a film's aural cues and flashing visuals draw the attention of visitors in that direction. The film features Indigenous people from several communities commenting on tradition and their contemporary lifestyles. Each clip is filmed in the individual's respective community or place of work, from a medical clinic to a First Nations school. The film assumes an interview style in which the interviewees appear to be responding to the question, "What do you want people to understand about being an Aboriginal person in Canada today?" (Phillips & Phillips, 2005, p. 62). However, the interviewer is not present in the shots, and the questions prompting the responses are never heard. Therefore, it appears as though the individuals featured in the film are speaking directly to the visitor. Although the statements are prerecorded, visitors are captured in a live communicative act by assuming the position of the intended recipient as they move through the Welcome Area space. The realism achieved through this style of film helps to disguise the editorial process involved in its creation. Moreover, because the Indigenous participants are seen in fairly contemporary contexts, filmed in the early 2000s, the

screen provides a sense of liveness when compared with the otherwise inanimate objects included throughout the museum.

The segments were shot by several Indigenous video producers throughout Canada, who asked the same scripted interview questions of participants but attempted to prompt a “spontaneous” response by encouraging participants to talk about themselves.¹⁹ Importantly, the filmic style used in the Welcome Video is unlike the documentary style of films often included in outmoded natural history museums; these older films were treated as scientific or anthropological research instruments and generally depicted Native people in their natural contexts while their behaviors were interpreted by non-Native narrators. In such films, Indigenous people were generally not allowed to speak directly to viewers without expert framing and interpretation. The videos in the FPH are self-referential to former museum practice because they display a new genre of filmic museum texts, demonstrating one of the ways in which the CMC signifies its reflexivity about older forms of museum representation.

While many of the themes in the exhibit are contemporary, planners were careful to illustrate the ways in which traditions and connection with environment continue in modern contexts through the use of media. For example, as visitors move past the introductory section of the museum, a longer video titled *Relationship to the Land* plays in a quiet corner, where seating is provided. In this living room-like area, designed as a “contemplative space,” members from Indigenous communities throughout Canada make statements about “the relationship of aboriginal identity to the ‘land.’”²⁰ Like the Welcome Video, a central communicative intent for this film was to “Involve aboriginal people in the creation of the product.”²¹ Indigenous participation itself is also on exhibit in this area as interviewees speak directly to viewers without a narrator interpreting or speaking on their behalf.²²

Contemporary Indigenous connections with tradition are further demonstrated in the Diversity and Origins section of the FPH. In this area, oral traditions are articulated via several forms of media including text panels, an art installation, film, and an audio storytelling booth. It includes one of the FPH’s two theaters, in which a film recounts the Mi’kmaq creation story, “Where We Come From,” as told by Stephen Augustine of Big Cove, New Brunswick. This film depicts a male elder sitting around a campfire with several companions, who listen attentively as he recounts the creation story. As it is told by a narrative voiceover, which actually speaks over the elder, the film is acted out in several shifting scenes. Periodically, the film returns to the campfire and its occupants. The theater is dark and circular, and because its seating faces the semicircle of the campfire, viewers are positioned as though they are sitting there with the actors. Therefore, it is as though visitors are either closely observing the event or are part of the group to which the story is being told. In addition, because the actors in the campfire scene are dressed in contemporary clothing, unlike the actors playing out the oral tradition, the point of departure could be the present moment. Due to the temporal moment and narration, a sense of liveness is conveyed with “Where We Come From,” as with the *Relationship to the Land* and Welcome videos.

Visitors are again part of a communicative act in an audio storytelling booth where they can listen to stories from various Indigenous oral traditions via earphones. They include themes about the Mortal World, the Sky World, and the Under World from different groups.²³ Curators opted to “Use aboriginal readers whenever possible” and aimed “for grassroots rather than trained voices.”²⁴ The effect is another performance in which listeners are positioned as the direct receivers of first-person narratives from Indigenous participants, and the interpretive intermediary and frameworks appear to be absent. The medium appears to be appropriate for the content, as a reviewer in the *Ottawa Citizen* suggested:

These engaging tales are an excellent way to experience storytelling, and the prowess of the recorded performers is such that listeners often laugh out loud. This clever presentation also avoids the irony of forcing the visitor to read about oral tradition. (“Hall honours First Nations,” 2003)

As the reviewer suggests, the visitor experiences this section of the exhibit through a number of aural and affective cues, or live mediation.

While the first two zones of the FPH are much more focused on contemporary themes, Zone 3 focuses on Survival and Cooperation in Ancient History. However, the historical themes addressed therein are also placed in modern contexts. Five themes organize the space into different “environments.”²⁵ Combining lighting, architecture, artifacts, life-sized objects, and diorama-like settings with projections, aural cues, and short films, this space recreates several regions in which Indigenous people lived historically and continue to reside in contemporary times. Large screens are used for projecting changing landscapes in the background, setting the stage for an Arctic village, a plains bull run, a maritime campground, and an Iroquois longhouse. The backgrounds for the first four areas change simultaneously with the seasons, as do the sounds heard overhead. For example, when the projected images show snow on the ground in four of the environments, the sound of wind whines through the exhibit, providing a multi-sensory experience for the visitor. Spring brings with it different images for each space as well as the new sounds of chirping birds and the hum of insects. Though text panels explaining historical migratory patterns and activities accompany each of the five spaces, the changing environments in this section of the exhibit play an important role in facilitating the feeling of a dynamic and live space.

In addition to its historical background and transforming spaces, this section includes short films placing each of the environments in more contemporary contexts via five television monitors with earphones. The short films shown in this area address controversial topics such as the famous 1990 Oka standoff between Mohawks and authorities over land. Another video discusses the legal battles faced by Inuit Arctic hunters for their whaling rights, and shows footage from the 1990s in which a group harvested its first bowhead whale after the courts ruled in their favor. The five areas present long, historical backdrops while at the same time allowing for

critical commentary on the effects of colonization and ongoing struggles over sovereignty and the revival of traditions. Though a narrator interprets the short videos, a number of interviews are included in which Indigenous participants speak directly to the camera, and the views presented are more sympathetic to the Indigenous agents involved in the conflicts.

As visitors exit the exhibit through the final zone of the museum, *Arrival of Europeans and Modern Existence*, there is one last notable media installation, a small theater featuring a 10-minute film titled "Affirmation." As its title suggests, the themes of the film on "contemporary Aboriginal people and perspectives" are very positive and uplifting.²⁶ A number of Indigenous people such as elders, successful professionals, and schoolchildren make statements like, "you can do anything you put your mind to," and upbeat music plays in the background. The film also takes place in a realist documentary style, and it spans a number of locations and activities with fast-action shots and montage. While the final areas in the FPH address some of the tumultuous results of colonization, the final sentiment expressed through the film's affect-evoking images and sounds suggests to visitors in the Indigenous first person that everything will be alright. It provides one last live and uplifting communicative act as visitors exit.

As the next section suggests, the CMC's emphasis on media technologies was not lost on museum reviewers. The following description of FPH reception in the local popular press reveals the ways in which the ideals of liveness, experience, and representation not only helped to constitute the FPH, but also circulated in popular discourse, which often conflated such concepts with media use and adoption. The proliferation of such ideals suggests they are powerful and commonly held values, which extended beyond museum administrators and planners to public expectations of contemporary exhibition. By identifying omissions in the coverage, we can better understand which issues were not explored with the privileging of visitor experience.

Reception of the FPH

Not surprisingly, reviews of the FPH in local popular media and Indigenous publications largely reflected a celebratory attitude toward Indigenous participation and the use of multimedia in the exhibit. While several reviews focused on visitor experience, very few mentioned the more critical issues shaping the FPH. For example, on the CBO-FM program "Ottawa Morning," reviewer Alvina Ruprecht praised the audio storytelling booth, stating, "It was really very well conceived, so you were almost there, living the experience but also sensing what the spiritual experience might have been."²⁷ Ruprecht cited the sense of liveness and experience facilitated by the exhibit and emphatically remarked that it was "very different" from *The Spirit Sings*. However, she made no mention of the conditions spawning protests of the former exhibit or whether they had been resolved.²⁸

Several popular press articles were also heavily constituted by official CMC discourse and noted the sense of Indigenous voice and environment in the exhibit. Tony Lofaro's article in the *Ottawa Citizen* noted the importance of "extensive planning with aboriginal groups" and provided a quotation from David Morrison, the CMC Director of Archaeology: "This is the First Peoples Hall and we wanted it to have, in part, a First Peoples voice" (Lofaro, 2003, p. D8). Similarly, another article in the *National Post* suggested that the museum provides a balance between Indigenous voices and scientific perspectives, and its title was appropriated from the comments of a CMC official: "Neither voice drowns out the other" (Cowan, 2003, p. AL1). Denis Armstrong of the *Ottawa Sun* wrote that the exhibit "inspires awe," and noted the "eerie realism" with which "the exhibition recreates the natural environments of First Nation people" (Armstrong, 2003, p. 28). Armstrong devoted several lines to quotations from Canadian Museum of Civilization Corporation President and CEO Victor Rabinovitch. Similarly, *Inuit Art Quarterly* included interviews with spokespeople Robert McGhee and Gerald McMaster prior to the opening (McCarthy 2000a, 2000b). The journal's case studies included celebratory statements from the co-curators on the consultation process (McGhee, cited in McCarthy, 2000a).

Very few stories mentioned the FPH's more critical omissions, including the continuing struggle of the Lubicon Lake Band of Cree over land rights and a newer conflict between the CMC and the Algonquin Kitigan Zibi First Nations, who were launching complaints against the museum for its possession of human remains from the Ottawa Valley. The museum had been reluctant to repatriate the remains because they carried "significant scientific data" ("Tonight on Citydesk," 2003, p. B4). Though coverage in the Indigenous newspaper *Windspeaker* on the opening of the First Peoples Hall was very celebratory (Andrews Miller, 2003, p. 25), another article on the same page of that issue discussed the Kitigan Zibi "tug of war over remains" with the CMC (Logan, 2003, p. 25). However, *Windspeaker* did not disparage the exhibit for its failure to address the topic of repatriation, and it did not rehash the AFN/CMA Task Force recommendation that museums increase their efforts to repatriate human remains (Task Force on Museums and First Peoples, 1992, p. 1). Moreover, neither story noted the irony that one of the first sections of the FPH Welcome Area features a greeting from the Kitigan Zibi reminding visitors that they are standing on Algonquin land. While the exhibit is legitimated by Indigenous participation and representation through the inclusion of the Kitigan Zibi statement, it avoids the more polemical topics concerning the group.

Like the popular press, coverage of the FPH in *Windspeaker* was laden with quotations from the CMC. Andrea Laforet, Director of Ethnology and Cultural Studies, is cited several times, and her remarks reflect an anticipation of concerns held by Indigenous audiences. Laforet highlights the involvement of First Nations people in FPH planning, mentorship programs for Indigenous students at the CMC, outreach efforts and publications, and even a program related to "sacred material" in which "First Nations are invited to view items from their history and identify special care and handling" (Laforet, quoted in Andrews Miller, 2003, p. 25). Reviews in non-Native

popular media focused more on visitor experience, gee-whiz media technology, and curatorial participation than the outreach programs directly impacting Indigenous people. However, the theme of Indigenous curatorial participation was emphasized in both Indigenous and popular media in lieu of other concerns, suggesting an overall focus on representation.

Reviews from academics in scholarly journals reflected more critical and analytical commentary on the FPH. For example, while a review from Métis scholar Olive Patricia Dickason (2004) is mostly descriptive, she notes that the exhibit fails to address current problems, “which has encouraged the criticism that politically, the overall presentation of the First Peoples Hall is ‘thin’” (p. 360). Similarly, in her review in *Anthropologica*, Julia Harrison (2003) noted that the museum did not take a strong position on the controversy over government boarding schools. While also congratulating the new museological paradigm demonstrated by the CMC, Ruth Phillips (2006) points out the fact that senior administration positions at the museum are not held by Indigenous people as with the Smithsonian’s National Museum of the American Indian, which is managed separately from the rest of the museum complex. The numerous quotations from non-Native CMC administrators in popular and Indigenous media reviews of the FPH reflect the CMC’s differing administrative structure.

Regardless of such critiques by academics, overall reception of the FPH in local media was celebratory. The exhibit largely escaped criticism while reproducing the discourses of museum leaders themselves, including notions of self-representation through a focus on collaboration and the ideals of liveness and visitor experience.

Conclusion

At the same time museums faced the problematization of Indigenous representational practices in the 1980s and 1990s, CMC administrators were intrigued with innovations in place-based media. New media adoption would help the museum facilitate an experience of liveness for visitors, and pedagogic discourses celebrating interactivity justified their inclusion. Museum leaders believed that the “tools and techniques” of the entertainment industry might help renew visitor interest, and they adopted the discourse of competition through which they compared themselves with market-driven, media-laden sites (MacDonald & Alsford, 1991, p. 308). This combination meant that the troubles of representational practices and institutional relevance were conflated, and concerns with colonial ideology were pinned on obsolete representational media. In this way, new media were conveniently touted as solutions to representational, economic, and pedagogic troubles in the CMC and First Peoples Hall. Indigenous concerns such as the land claims of the Lubicon Cree were omitted as outmoded forms of representation were problematized and visitor experience became central.

As Indigenous collaboration became a priority in exhibitionary practice, representation and Indigenous participation themselves became the subjects of exhibition and, along with visitor experience, were the teloi of museum media. FPH planners used new media in attempts to bring disembodied Indigenous peoples and cultures to life in a contemporary and interactive manner for the benefit of general audiences and in order to signify the museum's reflexive approach. Indigenous people speak in the first person to the audience about their cultures via FPH media, and this approach facilitates the experience of liveness for the visitor. Media appear to enable seamless communication from Indigenous participants to visitors, making them feel as though they are "almost there, living the experience."²⁹ In many ways, the FPH achieves media immediacy or transparency, which Bolter and Grusin (2000) describe as "ignoring or denying the presence of the medium and act of mediation" (p. 11). At the same time, the FPH expresses the "desire to get past the limits of representation and to achieve the real," which becomes "the viewer's experience" (Bolter & Grusin, 2000, p. 53). The real for FPH visitors is the experience of taking part in what appears to be a live communicative act with Indigenous participants.

However, as David Turnbull (2000) suggests, representational devices are "necessarily selective" (p. 99). Both the museum and its media mask the silences created through their use. Reviews in popular and Indigenous newspapers continued these silences as they celebrated the opening of the FPH, but the struggles over the repatriation of human remains and Indigenous homelands, which had spanned decades and first inspired the AFN/CMA Task Force, were long forgotten. Indigenous representation and visitor experience became the foci of news stories just as they were central to the exhibit.

Moreover, regardless of celebratory discourses, new media in museums can still lock Indigenous people into static contexts. Some of the reasons include the rapid rate at which new media devices obsolesce and the slow pace at which museums adapt due to their bureaucratic nature. Museums must strategize and budget years in advance for exhibits, and it is difficult to make anything look contemporary under such circumstances. In this time, staff members and priorities change. Take, for example, the Origins Theatre where the Mi'kmaq creation story, "Where We Come From," still plays, nearly a decade after the opening of the exhibit. The same collections of objects are still on exhibit in glass cases outside of the theater as well, regardless of the intention to show a "diversity of origin/creation stories" and to rotate associated artifacts at least once a year.³⁰ If the idea of using media is to avoid locking Native people into one static context, the "Where We Come From" example indicates that such efforts can be abandoned once an exhibit is functional, especially in light of budgetary constraints.

FPH planning documents indicate that curators believed media productions could frequently rotate, making for dynamic representations of Indigenous cultures. However, the exchange and updating, which would ostensibly depict Indigenous cultures as less static, never occurred. Each of the media productions, which largely address topics from the early 1990s, remains the same. Prerecordings are static by

nature and contradict the goals of articulating Native identity as contemporary and fluid. Moreover, museum media can feel comfortable for non-Native visitors experiencing a twinge of White guilt, but interpretive context and knowledge can also be more closely monitored by Indigenous people within the context of tribal museums (Isaac, 2007; Verran & Christie, 2007).

With each new permutation, media technologies are heralded for their democratizing potential, but they obsolesce very quickly. In addition, each new media adaptation brings its own representational issues, and there will always be trouble in bounding Indigenous representation so closely with new media. While Pauline Wakeham (2008) suggests that taxidermic semiosis extended beyond the diorama to early cinema, new media in exhibits like the FPH share some similar problems. There are of course important distinctions in that Indigenous people were not invited to share authority over interpretations of their cultures in museums of the past. However, dioramas, mannequins, and taxidermic animals, like new media in museums today, were similarly meant to evoke a sense of liveness and to create an experience for non-Native visitors. While today's new media use is justified through discourses of pedagogy and competition, it shares similar goals, which privilege visitor experience while overlooking other contemporary concerns such as the reasons the exhibit *The Spirit Sings* was protested by the First Peoples to begin with.

This chapter was not designed to minimize the importance of representing Indigenous people in contemporary contexts. The FPH demonstrates some opportunities for Indigenous people to address struggles with authorities over land rights, the lasting effects of colonization, and environmental concern (Brady, 2011b). There are also important lessons that can still be taken away from conflicts like the 1990 Oka standoff. However, such political issues tend to be rooted firmly in the past through dated footage rather than addressed in the contemporary moment in the FPH. These articulations have remained the same since the museum's opening in 2003. Media texts were considered by museum planners to be more adaptable to changing issues and conducive to a sense of liveness, but have remained static, even in this "museum for the twenty-first century." Museum professionals will undoubtedly continue their quest for the latest in communication technologies, but as the FPH demonstrates, the focus on liveness and representation itself can distract from other important issues and silence the longer stories and problems inherent in such ambitious sites.

NOTES

- 1 It is useful at this point to outline the concepts of liveness and interactivity as understood in this chapter. John Durham Peters (1999) points out that as electric media developed, they had the capacity to record and transmit life, and therefore the relationship between liveness and media like motion pictures, radio, and television was naturalized. In particular, those media capable of simultaneous broadcasting became associated with liveness, where

- the “contingency” of transmitting a new event was still possible (Peters, 1999, p. 218). Interactivity, in a basic sense, can be defined as “the degree to which participants in a communication process have control over, and can exchange roles in their mutual discourse” (Hanssen, Jankowski, & Etienne, 1996, p. 61, citing Williams, Rice, & Rogers, 1988).

Calypso and the Performance of Representational Politics

Susan Harewood

ABSTRACT

This chapter focuses on the intersection of representation in calypso performance, representation in calypso research, and representation in parliament. The chapter highlights the ways in which a particular discourse of citizenship shapes the ways in which calypso is thought about and how the democratic project in the English-speaking Caribbean is imagined through calypso performance. The argument focuses on the productive nature of calypso research. It is contended that much of this research, though vitally important to identifying the significance of calypso within the region, has, nevertheless, tended to reinscribe a rather limited view of citizenship. The chapter makes a case for reimagining calypso's political significance by suggesting ways to reinvigorate the creative practices of calypso research.

Any licit approach to questions about representation, in other words, must make available a shifting multifocal and mobile set of grids.

(Shohat, 1995, p. 176)

A critical question for many is, Where are the new Carnival musics leading? Or, to put it another way, what kinds of future might be envisioned through them?

(Guilbault, 2007, p. 276)

Calypso has been at the center of the modern Anglo-Caribbean nation-state. The calypsonian (i.e., the performer/writer of calypsos) played a key role in resisting imperialism in the pre-independence period and, in the post-independence period, calypsonians have been hailed for their ability to keep a check on the power of political elites. In fact, academic research on the calypso has told and retold a narrative that posits a direct link between representation in calypso and political representation in the parliamentary democracies of the Anglo-Caribbean. In this chapter I seek to examine this narrative. The chapter focuses on the intersection of representation in calypso performance, representation in calypso research, and representation in parliament. I highlight the ways in which a particular discourse of citizenship shapes the ways in which calypso is thought about and how the democratic project in the region is imagined through calypso performance. Thus I focus on the productive nature of calypso research, suggesting that calypso research emerges within and reinscribes a limited view of citizenship. The chapter makes a case for reimagining calypso's political significance by suggesting ways to reinvigorate the creative practices of calypso research.

I will begin with a review of the calypso research literature by examining the intersecting notions of representation that have surfaced in the work. Thus the chapter will briefly examine representation as presence, particularly in the early literature on calypso. In this earlier literature, scholars sought to articulate presence in order to challenge racist colonial ideologies. However, the main way in which representation emerges in the calypso literature, and which I focus on in this chapter, is representation as "standing in for" as both calypsonian and politician are described as standing in for or representing "the people." Thus the chapter focuses on the work that is done by the heavy emphasis on "the political calypso," and how the political calypso is defined in the literature plays a part in how citizenship and political participation have been imagined. Finally, the chapter will trace the possibilities of imagining a different political project within the region by returning to some of the creative research strategies used in calypso research, by drawing upon research strategies that are missing from the literature, and by examining the challenge posed by new carnival music styles.

Calypso Research: Histories, Intellectuals, and "The People"

Calypso is a popular music genre that emerged in nineteenth-century Trinidad. Indeed, Trinidad is recognized as the center of the calypso world, though calypso is in many ways a transnational music because of the number of influences that came together in Trinidad to give rise to this rich art form. It is also transnational because other Caribbean territories have developed their own, though often related, creative calypso music traditions. And finally, it is transnational because it is an important part

of the cultural life of Caribbean diasporic communities. Calypso is a music form most closely linked to the pre-Lenten carnival in Trinidad and Tobago. However, though calypso remains linked to carnival, the very engine room of the festival, the number of carnivals that have arisen through the Caribbean and the diaspora have meant that there is a significantly longer period in which calypsos can be created, performed, and heard around the world. Calypso is a music of praise and celebration, blame and castigation, joke and wit. It is a dance music, a music that should be listened to very carefully to catch the play on words and coded messages, and a music that should be sung along to. It is known for its incisive critique as well as its parodic laughter aimed at the social and political foibles of members of society from those with the highest status to the lowest status. It is, in fact, possible to identify myriad ways in which calypso operates within the Caribbean and, though the research on calypso seeks to highlight that breadth, there are a number of key themes that consistently emerge, two of the most important of which I explore below. First, I examine the research that focuses on the history of calypso, which is often linked to important discussions of musical, national, and racial authenticity. Second, I examine the research on the political calypso and the ways in which it links the music to parliamentary representation.

Constructing Histories

The foundational academic work on calypso was conducted by scholars from anthropology, ethnomusicology, folklore, and literature rather than media studies. Many of these writers had differing, though related, objectives. Deborah Thomas and Karla Slocum (2008) provide a valuable examination of the position of the Caribbean in anthropological research. They examine some of the “master symbols” that have guided anthropological examinations of social change in the region. When we examine the foundational calypso research, it is possible to recognize that two of the master symbols identified by Thomas and Slocum – cultural retention and cultural stripping or deficiency – have been important to the ways in which calypso has been examined. Thus, much of the early work seeks to write against the colonial archive and its effort to produce a Caribbean defined by deficiency.

Some of the earliest writing seeks to establish the origins for the actual word “calypso.” For example, Daniel Crowley (1959) outlines eight origination narratives, some serious, some amusing, that suggest how the word calypso might have been derived. These origination narratives include the theory that calypso might have been derived from *kaiso*, an African word meaning bravo; *carrousseaux*, a word derived from the old French term for a drinking party; *caliso*, a Spanish word meaning peon; *carrizo*, a Latin American word meaning reed and also used for bravo; and *carieto*, a Carib word for a joyous healing or courting song. Different elements of this list are replicated across the calypso literature. Errol Hill (1967, 1972) investigates Crowley’s eight narratives and finds most of them “highly improbable.” Hill ultimately is

persuaded by his research that Crowley's first narrative is the correct one, that is, that calypso derives from the African, specifically Hausa, word *kaico* or *kaito*, which became *kaiso*. (This word is still used today to signal a song well sung, to refer to the calypso music genre, and especially to refer to particularly excellent calypsos.)

As I have suggested, these origination narratives, or related ones, are replicated across the literature, and often in their recounting the emphasis is placed on how these narratives highlight the multicultural nature of Trinidad. For example, Crowley draws attention to the racial diversity in Trinidad and then states that "nearly every national and racial group [in Trinidad] has its own theory of origin for calypso, both the word and the institution" (Crowley, 1959, p. 59). The diversity of Trinidad's ethnic and racial makeup is the starting point for many of the texts and seems to be used for two important purposes. On the one hand, the emphasis on the multicultural nature of Trinidad seems to provide some evidence as to why Trinidad, and not one of the other Caribbean territories, is the home and originator of calypso. Thus, some of the writers challenge not only those who try to suggest that calypso emerged from one of the other islands, but also those who wish to suggest that calypso was a Tin Pan Alley invention. The calypso craze in the United States in the 1950s seemed to have prompted some murkiness over calypso's origins. Thus the early research challenges this murkiness, and differentiates between the novelty songs made for profit in the United States and the true calypsos of Trinidad. This is, perhaps, interesting because the question of authenticity in the face of commercial pressures has arisen in the contemporary period.

Another reason for the emphasis on multiculturalism that emerges from the literature is that the emphasis sought to challenge the scholarship, which argued that the ethnic diversity of the Caribbean colonies meant they could never attain the type of unity that would make them successful societies and successful nation-states. Thus, in some ways the emphasis on difference within unity is an argument for the possibilities of self-government. This can be seen, for example, in Elder's work. His article "Color, Music, and Conflict" (1964) is illustrative of a nationalist narrative that argues that, despite diversity, national unity is possible:

Colonial governors, low class women of lax morals, African heroes, batoniers and tiepins whose names adorn the history of Trinidad, strong men and Amazonians – all have had their role in a land where men of many racial origins struggle, in the crucible of race-mixture, towards something unique in history – towards a new nationhood which is gradually evolving out of this diversity. (Elder, 1964, pp. 128–129)

This quotation locates Elder's work within the national independence project (Trinidad and Tobago gained independence in 1962). He presents his cast of characters – from colonial governors to Amazonians – to indicate the race, class, and gender difference that he sees as now being united under the sign of the nation.

Nevertheless, despite the emphasis on the multicultural influences on calypso, the main thrust in the literature is in identifying the calypso as an African-derived cultural

practice. There was some initial debate on this issue that is, perhaps, illustrative of the struggles over the conceptual boundaries of national identity in the Anglophone Caribbean. In his history of calypso, Raphael "Roaring Lion" De Leon (1980–1988) emphatically states that the calypso originated in France and that those who suggest that it originated in Africa are not only wrong, but are also perpetuating a damaging falsehood. De Leon states that documentary evidence demonstrates that the calypso was invented in 1295 in France by Guillaume de Machaut. He suggests that the French *ballade* has the same musical structure as the calypso and that the *ballade* was exported from France to a number of countries. In the processes of exportation, the name of the *ballade* changed and in Trinidad and Tobago this *ballade* was renamed the calypso. De Leon (1980–1988) suggests that the *ballade*/calypso came to Trinidad and Tobago via French planters who came to the island from Martinique. De Leon is not the only one to suggest that the calypso is not African. Peter Manuel (2006) stated that the calypsos of the 1930s "were essentially English in character," though he provides no clear reason for this conclusion. Perhaps the contentious nature of this idea of a European source for calypso is suggested by the story that in 1859, the American William Moore stated that the calypso was simply a Trinidadian version of the British and US ballad; a crowd gathered outside of his hotel and the calypsonian Surisma the Carib ridiculed Moore's conclusions in song (Brown, 1990; Crowley, 1959).

By contrast, other scholars such as Errol Hill (1972), Raymond "Attila" Quevedo (1983), Trevor Marshall (1986), Gordon Rohlehr (1990), Keith Warner (1982), and Hollis "Chalkdust" Liverpool (1998) draw a direct genealogy of the calypso from African music forms. Like De Leon, Hill, Quevedo, Rohlehr, and Warner stress the importance of the arrival of immigrants from Martinique and Haiti; however, these writers suggest that it was the *African slaves* that arrived with the planters who brought the calypso to Trinidad and Tobago as well as Africans freed from slave ships.¹ For example, Rohlehr (1990) starts his richly comprehensive text by suggesting that "one possible approach to writing a history of the calypso in Trinidad would be to identify its West African roots and then to trace what happened to that oral tradition in colonial Trinidad" (Rohlehr, 1990, p. 1). He links this approach to the work of anthropologists such as Melville Herskovits. This is an important link as it contextualizes the research within the discourse of African cultural retentions and thus illuminates some of the issues to which calypso researchers are speaking.

The research on calypso was emerging in a period in which the presence of intellectuals of the formerly colonized territories was transforming the production of knowledge within certain parts of the academy and beyond it (see, e.g., Gershenhorn, 2009; Schwarz, 2003). This transnational movement of bodies, ideas, and activism meant that spaces were opening where scholars could challenge the standard racist tropes about inferiority of colonized subjects.

For example, Melville Herskovits was influenced by these changes. According to Kate Ramsey, Herskovits' interaction with African American scholars/artists convinced him of the continuity of African cultural forms. He believed that the exploration of these continuities would "instill greater self esteem and pride among

peoples of African descent by culturally validating their connection to an ancestral past” (Ramsey, 2000, p. 199). Not only is it possible to see a link between Herskovits and Rohlehr, but it is also possible to see links between Herskovits and Jacob Elder, whose work has been fundamentally important to calypso music research. Elder collaborated with Alan Lomax, who studied under Herskovits; in his PhD dissertation, Elder uses a scale developed by Herskovits to indicate the level of “Africanness” in Trinidadian music and religions. Using the scale, Trinidad got a “B” for quite African whilst Brazil got an “A” for very African. Using Alan Lomax’s method of cantometrics Elder set out to measure change and how much “Africanness” still remained in Trinidadian music forms. He based his work on the calypso, but was interested in being able to draw conclusions about the breadth of Trinidadian music practices. Elder (1964, 1966, 1969) was especially interested in African survivals. In his dissertation he identified his research interests in the following manner:

First granted that the Negroes brought with them a highly developed musical culture with them to Trinidad. Granted that they encountered in the slave-society certain socio-cultural conditions which compelled them to adjust their “way of life” in order to survive in their new environment. Granted that change in the Negro musical culture was bound to occur, we then ask: Has Negro musical culture as it stands today in Trinidad assimilated non-African music traits more than it has retained its own ethnic traits? (Elder, 1966, p. 7)

Note that in this statement Elder immediately takes as a given that which colonial scholarship refused to recognize – the value and complexity of Black cultural practices. He thus challenges the colonial deficiency caricature. His work was a direct engagement with an issue that was controversial at the time – whether Caribbean people of African descent and African Americans had retained, despite the ravages of slavery and imperialism, any cultural connection to Africa. He based his work on the calypso, but was interested in being able to draw conclusions about the breadth of Trinidadian music practices. He would go on to write about the broadest range of Trinidadian cultural practices, and became part of Trinidad and Tobago’s post-independence government as Minister of Culture and Education for Tobago as well as consultant to the Ministry of Youth Sport Culture and Creative Arts for the government of Trinidad and Tobago.

These histories are important in a variety of ways. First, we recognize that the histories provide an answer, or answers, to the question of where this cultural practice came from. In doing so, the absence of or racist representation of people of African descent in colonial scholarship is met with presence – not only in the histories that write Black people into history, but also the scholars themselves whose presence in the academy poses new questions. Certainly, these were questions that some would steadfastly ignore but the questions are posed nevertheless.

Second, the histories are part of the processes of building a national imaginary. Intellectual work on nationalism has identified the importance of making traditions and originary myths to the production of national identities (see, e.g., Anderson, 1983;

Hobsbawm & Ranger, 1983). Though the origins of European nations might be set in the ancient past, colonial settler states like those of the Caribbean often bypass the originary myths of the indigenous peoples and negotiate a more recent narrative linked to the time of European “discovery.” However, constitutional independence for these states requires a rethinking of the colonial narrative of origins, and calypso research has been important to the renarrativization of national origins. What William Green says about Caribbean history in general is true of calypso histories too. Green states that the creolization of Caribbean history has resulted in an emphasis on laboring-class resistance and the generation of “new national heroes whose historic exploits are thought to affirm creole traditions and express the legitimate aspirations of island peoples” (Green, 1993, p. 28). This scholarship, therefore, was part of what Hall (1994) called “imaginative rediscovery” or what Shohat (1995) called “compensatory origanism.” Both Hall and Shohat recognize these acts of constructing roots as vitally important. Though Hall ultimately highlights the problems with discovering original, essential identities in an unproblematized past, he still stresses that such historical excavation “continues to be a very powerful and creative force in emergent forms of representation amongst hitherto marginalized peoples” (Hall, 1994, p. 393).

The third way that these histories are important is the way in which they can draw our attention to the imaginative work of scholarship. Note that Hall makes reference to “imaginative rediscovery” and the “creative force” of these histories. These renarrativizations are creative or imaginative intellectual acts. In order for the calypso scholars to write the work that they did, they had to read against the colonial archive and write against the colonial archive. For example, in “The Calypsonian as Artist: Freedom and Responsibility,” Rohlehr (2001b) reads the history of calypso through the ordinances passed against calypso. The histories also had to seek out alternative informants and sources of knowledge. In this the calypso became both the object and subject of the studies as the calypso has been used as a valuable historical document in itself. Thus, Keith Warner lauds the calypso as a historical document: “One can follow the varying faces of Trinidad’s social and political history through a careful analysis of many of the calypsos composed over the years” (Warner, 1982, p. 59). Similarly, Cynthia Mahabir (1996) describes the calypso as “the subordinate class’s transcript of important events in Trinidadian society” (p. 60). The writers argue, then, that in calypsos we can read the political history of a people. This perspective serves as an intellectual framework for work such as Louis Regis’ *The Political Calypso: True Opposition in Trinidad and Tobago 1962–1987* (1999). He uses his survey of Trinidadian calypsos from 1962 to 1987 (together with some foundational discussion of the 1956–1963 period) to examine the political history of Trinidad and Tobago.

Like Hall, I must ultimately be skeptical of fixed historical narratives as a source for unproblematic essential identities. Nevertheless, the creative impulse in research seems to me to be something that we need to retain at this time. The ability to read against the grain of the colonial archive and seek out alternative sources to those legitimated by colonialism are research strategies which, I will suggest later in this chapter, must be reinvigorated in this postcolonial period.

The Political Calypso: Intellectuals and “The People”

There is a broad range of calypso topics and forms. Nevertheless, the political calypso tends to receive the most attention in the literature and in media commentary. Gordon Rohlehr defines the political calypso in the following terms:

The political calypso emerged out of this background of conflict as a medium for articulating class struggle as well as a vehicle for transmitting images of self and potential, different from the images which had traditionally been transmitted by the prevailing order. (Rohlehr, 1985, p. 2)

He states that it emerged at the same time as the rise of adult suffrage and the trade union movement. Thus, the political calypso is presented as an important part of the processes that led to and characterized the new democratic Caribbean state. Rohlehr further points out that the response from the colonial administration to this political ferment, including the politico-aesthetic art form of the calypso, was predictably draconian and included “sedition bills, armed occupation, and the censorship of books, pamphlets and calypso records and performances” (Rohlehr, 1985, p. 2). Thus the political calypso is closely tied to modern democracy in the Caribbean. In fact, Frank Manning probably makes the most unequivocal connection between the democratic enfranchisement and the calypso:

Calypso is an expression of participatory democracy and a means of preserving it. Like the voting franchise, it is an instrument of retribution against an incumbent government. (Manning, 1990, p. 246)

Generally, the writing on calypso has delineated a three-way relationship between the politicians, the calypsonian, and the audience. In this relationship the audience is equated with the electorate and the calypso is said to faithfully reflect the reality facing Caribbean citizens. This leads to a position in which the calypsonian is said to stand in for the citizens, representing their interests to the political directorate. This, then, is the symbolic work performed by much calypso research – it is the representation of calypso that serves to legitimize a particular style of representational government. However, I would argue that this legitimization of the parliamentary system and the authority of the calypsonian and politician, though progressive in some ways, comes at the expense of the voice of the electorate.

In some ways it is possible to recognize the calypso research as depicting calypso as the ideal liberal democratic space of deliberation and opinion formation. Two interrelated tropes that are consistently used within the research focus on the political calypso as a type of public sphere. These are the description of the calypso as the “poor man’s newspaper” and the calypsonian as the “voice of the people.” Both phrases seek to define the calypso as an accurate archive of public events and the

calypsonian as both recorder of those events and faithful representative of his audience. The phrase “the poor man’s newspaper,” or variants of it, can be found in a number of works on calypso. Quevedo (1983) suggests that calypso was identified as the “living newspaper” by the US magazine *Time* in 1949. Since that time the phrase has been used to emphasize the calypsonian as a monitor of social political events, as taking on the watchdog function of the press. Thus Gordon Rohlehr, who evinces a broad and multifaceted range of roles for the calypsonian in the rich body of his work, identifies the calypsonian as, among other things, an investigative reporter of local events in his “Man Talking to Man” article (Rohlehr, 1985) and a guardian of freedom of expression in both that article and in “‘We Getting the Kaiso We Deserve’” (1998). Similarly, the idea of the calypsonian as the “voice of the people” is also replicated across the literature and seems to perform similar work; that is, it portrays the calypso and the calypsonian as mirrors that simply reflect the will of the audience/electorate. The “voice” trope appears in a variety of ways. John Patton (1994), for example, writes of the calypsonian as a seer. Frank Manning (1990), quoting calypsonian The Mighty Sparrow, describes the calypsonian as “the mouthpiece of the underprivileged.” C. L. R. James, again with specific reference to Sparrow, describes him as *vox populi* and suggests that Sparrow “faithfully reports public sentiment” (James, 1973, p. 376). Therefore, these writers suggest that the experiences of the underprivileged and the artistic expression of the calypsonians are the same. In fact, Warner, drawing from C. L. R. James and Selwyn Ryan, reinforces the idea of the “fidelity of the calypsonian as indicator of contemporary public opinion” (Warner, 1982, p. 70).

To hear the calypsonian, then it would seem, is to hear “the people” through the offices and creative talent of their own intellectual. Accordingly Christine Ho (2008) refers to the calypsonian as an organic intellectual, and certainly the Gramscian concept that these calypsonian-intellectuals emerge from the working classes and assist in the consciousness raising of the workers runs through descriptions of the calypsonians in the literature. For example, in Regis’ (2007) monograph about Black Stalin, a quote from the calypsonian seems to emphasize his own sense that his intellectual labor emerges from his connection his community.

As a composer and man living with and talking with people you have to understand what I sing is the people own . . . is them thing. All I doing is take it up, nice it up and hand it back to them . . . cook it nice, fix it up sweet, so I got to find the correct seasoning to put in it. (Regis, 2007, p. 113)

This is a role that Gordon Rohlehr (2001b) also sees Stalin performing. Yet Rohlehr, who as I have suggested before tends to see the complexity of the different roles that the calypsonian occupies, also draws attention to the vanguard intellectual persona of calypso. Thus he contrasts Stalin’s knowledge, which he sees as emerging from the class struggle, with that of The Mighty Chalkdust, former teacher, author, university professor, and a leading scholar of calypso and carnival. In any case, though

much of the literature seems drawn to the idea of the calypsonian as an organic intellectual, in many ways it is the vanguard intellectual who actually takes form in the methodologies used in the literature.

A comparison of two chapters can make this point quite clearly. In Keith Warner's chapter "Social and Political Commentary in Calypso" from his book *Kaiso! The Trinidad Calypso: A Study of the Calypso as Oral Literature* (1982) and in Louis Regis' chapter "The Calypso and Politics 1956–1962" from his book *The Political Calypso: True Opposition in Trinidad and Tobago 1962–1987* (1999), one can witness the suturing of calypso and electoral politics quite clearly. One can also see that, although the idea of *vox populi* is definitely present, the actual voices and interests of "the people" disappear quite quickly. I have selected these two chapters because the information that they present is replicated at different points within the literature and, therefore, forms an important part of the way that the political calypso is perceived.

The structure and method of both chapters is very similar. Both scholars trace moments in Trinidad's political history from the rise of the People's National Movement (PNM), led by Dr. Eric Williams, in 1956 through to independence in 1962 and a little beyond it. Both chapters highlight the contributions that The Mighty Sparrow made to Williams' political fortunes. Sparrow and Williams are presented as the heroes of this period in Trinidad and Tobago's political life. Williams is presented as the hero pushing through policies that create the modern, independent, self-confident nation-state. Sparrow is presented both as Williams' heroic cheerleader – indeed, a major plank of PNM public relations – and as a mirror for public sentiment. The chapters are not formulaic; nevertheless it is possible to see some similarity in the way the analysis is presented: a key political moment in the history of the nation-state is presented, the calypsonians' lyrical interpretation of that political moment is then presented, and finally, conclusions about the audience's agreement with that interpretation are made from the same lyrics. This is problematic as one cannot read audience reactions from content; the meaning-making processes of the active audience are complex and largely unpredictable.

The substitution of the scholar's interpretation for that of the audience that we find at this point in Warner's and Regis' work is seen at other points within the calypso literature. For example, it is particularly clear at those moments in the literature when audience assessment of the value of a calypso is presented but discounted, often in favor of the writer's evaluation. This happens, perhaps most often, in the assessment of the new carnival music such as soca.² For example, Rohlehr (1998) contends that the audience is too ready to accept mediocrity and identifies some calypsos which, in his estimation, should have been popular but were not. Similarly, Regis suggests toward the end of his book that one of the major challenges facing the calypsonian is his increasingly "hedonistic" and "giddy" audience, who are "addicted to the anodyne of pop music" (Regis, 1999, p. 209). The audience's evaluation is, therefore, viewed with some skepticism. However, on the other hand, the politicians' assessments carry a little more weight. Both Warner and Regis, for example, use approval and appraisal from leading Caribbean and international

anticolonial leaders C. L. R. James, Albert Gomes, and Eric Williams to affirm the political significance of the calypso.

Thus, by ventriloquizing the audience reactions by reading reactions from lyrics, and by substituting the politician's and the scholar's views for those of the audience/electorate, it would seem to me that the research is naturalizing a form of representational politics in which the electorate are, if not irrelevant, at least marginal. "The people" is a monolithic category, and the pertinent question to ask, then, is what work this concept of "the people" does. It gives the appearance of lending legitimacy to the political project articulated in the literature on the political calypso. Taken without reflection, the presence of "the people" in the public forum that connects the calypso stage to the parliament, and the articulation of their interests in calypso form, is the ideal of liberal democracy. However, as I have suggested above, the category of "the people" actually serves to erase citizens/the electorate/the audience from the spaces and practices of political discourse as imagined in the calypso literature. This is much of the terrain suggested by Spivak in "Can the Subaltern Speak?" (1988). Can "the people" speak? No, and for many of the reasons Spivak discusses. "The people" can only exist as a category constructed in the literature and thus cannot speak, nor effectively be heard in this silenced position. "The people" suggests a clearly defined political community with congruent interests. However, this depiction hides not only the heterogeneity of identities and interests that comprise Trinidadian or Caribbean society, but also the ways in which this category relies on those colonial definitions of race and gender to which I made reference earlier. Thus, though "the people" seems almost progressive in its inclusivity (we are all people, aren't we?), its construction in the literature demonstrates the persistence of colonial racial and gender ordering.³ This ordering produces the borders of the category "the people" and reveals that there are very few residents of the Caribbean whose right to humanity/citizenship cannot be viewed with some suspicion.

Suspect and Invisible People

One way in which we might pay close attention to how the category of "the people" can inadvertently limit the ways in which active citizenship is imagined is by analyzing how the arrival of the US GIs in Trinidad in 1939 is represented in the literature. The United States established a base in Trinidad during World War II – a significant event in the narrative of both Trinidad's history and the history of calypso. The arrival and social impact of the GIs is presented over and over in the calypso literature. For the research that focuses mostly on the steelbands, the arrival of the GIs and the establishment of the oil refinery are mostly identified as the catalysts to the invention and development of the steelband. However, in the literature that more specifically focuses on calypso, the arrival of the GIs is described as having devastating effects on the gender, race, and sexual relations in the island. There are three main sets of characters in this story: the GIs, the women, and the calypsonians.

The GIs are identified as an invading force that, while bringing jobs, money, and an audience for calypsonians, is also seen as a catalyst for moral decay in the island as the numbers of brothels, prostitutes, and nightclubs increased. Elder describes the difficult social conditions – industrialization, a widening gap between rich and poor, pressure on housing – and then states that “It was on these conditions that World War II descended, with the invasion of Trinidad in 1939 by the American serviceman, his wealth, his power and his emphasis on success” (Elder, 1964, p. 134). As an invading force, then, the GI is identified as a threat to the nation.⁴

In the literature and in this sense of an invading army, women’s bodies become the very symbol of the nation. Transnational and postcolonial feminist scholarship has explored and critiqued this issue time and again – the control of women’s bodies becomes equated with the control of the nation-state, the contours of women’s bodies and reproductive rights become inseparable from the control of the landscape and contours of the territory. The calypso literature consistently and uncritically makes use of women’s bodies in these ways. Thus, for example, in Elder (1964), Hill (1972), Warner (1982), Moore (1999), Manuel (2006), and Ho (2008), women are identified as the site at which Caribbean men stake their claim to the nation in the face of the challenge from the US GIs. Ho, for example, writes, “In defense of Trinidadians, calypsonians sang about the fury of the common man whose woman, wife or sister had been stolen from him” (2008, p. 10). Thus women are presented merely as property that could be stolen from a calypsonian, who is then pushed to use his creative lyricism to defend Trinidadians – one might say Trinidadian citizens. I would argue that in this example women cannot be said to have full membership in the category “the people” as they exist merely as symbols of, not citizens of, the nation. This inability to attain full humanity presents itself throughout the research. The scholarship is faced with the challenge of what to do about the silences. Most of the calypsonians were/are male and the calypsos recount some male perspectives on women. Much of the literature highlights various aspects of what Elder called “The Male/Female Conflict in Calypso” (1968). Of course the researchers cannot rewrite the gendered thinking of calypsonians of the 1930s and 1950s; however, if the calypso’s field of engagement is being taken as a model for the modern Caribbean state, then it seems to me that the writers who are making this argument must think carefully about what this means to the democratic project. To put it another way, might scholars who read against the grain in order to intervene in imperial discourses provide similar strategies for intervening in sexist discourses?

In many cases the matter remains unaddressed. Some of the writers continued to build on the idea of the calypso as an accurate record, and thus one or two seem to take the calypsos as indicative of the inherent perfidy, greed, and highly suggestible nature of Caribbean women. Thus Manuel states that when the GIs arrived in Trinidad, “calypsonians watched with dismay as local women forsook their company for that of the free spending GIs” (2006, p. 224). Most, however, looked to psychological and social reasons. For example, Elder drew on literature that suggested that Black males were psychologically damaged by being brought up in matrifocal families. He

argues that the songs reflect the calypsonian's neurosis and that it is a reversal of the Oedipus complex that is likely to affect the "man-child" for the balance of his life. At some points, Warner's (1982) analysis takes the anti-female songs less seriously than Elder seems to. Thus he suggests that the number of calypsos that castigate women for being "unclean" or "ugly" are just examples of the calypsonian being "ungallant." This seems to dismiss these songs, then, merely as examples of bad manners. Nevertheless, Warner does take up feminist author Merle Hodge's psychological reasons to explain the male/female interplay in calypso. Warner takes up Hodge's contention that Caribbean men were psychologically emasculated by slavery, the Crown Colony system, and the US invasion in the 1930s, and they therefore sought healing through the denigration of women.

It should be clear that these accounts pathologize Caribbean gender and sexual relations. The ideas of the greedy, over-heated Black woman of low morals and the emasculated yet hypersexualized Black male are part of the colonial archive of representations that seem here redeployed within the nationalist project. What we are seeing, then, is the persistence of the moral economy of colonialism. Despite the efforts in the literature to challenge the colonial discourses of deficiency, this dehumanizing narrative still makes its presence known. This is extended to non-Black Caribbean citizens as well, though not always in exactly the same way. Though Caribbean citizens of all racial heritages run the risk of being deemed excessive in their tropicalized sexuality, many are simply written out of the narrative altogether – made invisible, in other words. For example, Shalini Puri (1997) presents one of the few accounts of the US GI invasion that references Indian women specifically. Puri's article, in general, is a less celebratory account of the political calypso than some of the other texts to which I have referred. Her work deals with the production of nationalized racial hierarchies within the Trinidadian national imaginary and provides a strategic re-reading of Indian women's agency within these accounts.

It should also be clear that this pathologizing of the men and women of the Caribbean makes their right to full citizenship suspect. There has been an unbidden hierarchizing of citizenship at the heart of the calypso literature, and this points to a significant problem. I have been suggesting that not only does calypso have a part to play in representational politics in the Caribbean – this is a case made over and again in the literature – but also that the calypso literature itself is part of the way in which calypso comes to make meaning, especially within the politics of the region. The productive nature of these academic discourses can be traced in cultural policy decisions, calypso competition criteria, and in the public discussions about the meaning, purposes, and political significance of calypso (Guilbault, 2007; Harewood, 2008b). However, the limited access to full citizenship afforded in these discourses suggests that the democratic project is failing to deliver on its independence promises. This failure is the subject of a growing body of Caribbeanist literature, especially, though not exclusively, on Jamaica. Thus, Holger Henke's chapter, "Freedom Ossified, Political Culture and the Public Use of History in Jamaica" (2003), which contends that the project of freedom within the Caribbean has been ossified into a set of

narrow and anemic celebrations of independence, inspired a number of scholars to examine political culture in the region. Similarly, Percy Hintzen (2005) contends that the nationalist movement included “the people” but without permitting equal rights to citizenship. The working classes were still seen as immature, deficient, if you will. In much of the rest of his work Hintzen highlights not only the ways in which access to citizenship is classed, but also how it is racialized. Caribbean feminists have launched a consistent challenge to the masculinist construction of the Caribbean nation-state. So how might these critiques of the political culture in the region inform calypso research? What strategies, then, are available to challenge the persistent effects of the colonial moral economy, even as it has snuck into a literature that has not only sought a progressive response to domination in the region, but has, in many instances, been successful in its ability to challenge some forms of control?

Envisioning Futures: Performance and “Disreputable” Spaces

I would argue that the possibilities of calypso research contributing to the freedom project of the Caribbean lie in considering the ways in which calypso performance practices exceed the ways in which they are described and analyzed in calypso research. In my own scholarship I have attempted to do this by analyzing calypso and soca through performance, and by considering those calypso music practices that are less “reputable” than the political calypso. I would also like to suggest that possibilities in calypso research also lie in asking more consistently what it means to have a multicultural society in the Caribbean, and how this might inform our theoretical engagement with the popular resistive arts.

The bulk of research on the calypso analyzes the music genre through the examination of lyrics. There are some good reasons for this. The play of language in calypso is a significant part of both its appeal and its power. I have argued elsewhere that perhaps one of the reasons that calypso has fit so readily into the idea of “the poor man’s newspaper” is because of its emphasis on words. However, I have also suggested that relying almost exclusively on the lyrical content of what is, after all, a music genre limits our attention to the multiple ways in which calypso makes meaning. Thus I have sought to locate calypso within the field of carnival masquerade (Harewood, 2005, 2007) and its attendant movement, flexibility, and polysemy. My work seeks to analyze calypso performances, certainly by acknowledging the importance of the lyrical content, but also by listening to the meaning making in the music and instrumentation and looking at the costuming, dance movement, props, and the spaces of performance. This not only opens one up to the multiple ways in which calypso makes meaning, but it also pushes one to acknowledge that all meanings, whether lyrical or otherwise, are not as stable as might first appear. This not only draws attention to the polysemy of the performance practices, but also

permits me to concentrate on the complex chains of meaning at play in the lyrics too. In doing this, I seek to open the texts of performance up to more and more questions. This is a different pedagogy of scholarship, one that, rather than being built on certainty, is one built on the creative potential of inquiry. Such a focus can contribute not merely to the academic quest to discover, but also to the intellectual's quest to imagine.

The focus on performance also permits more effective engagement with the new music style, soca. In much of the literature, soca is cast as the profligate child of calypso and a direct contrast to the legitimate work that is done by the political calypso. Part of soca's "failure" is seen as its seeming rejection of the calypsonian's sophisticated word play. In contrast to the dismissal of soca, Jocelyne Guilbault asks what I think is an extremely important question, reproduced in one of this chapter's epigraphs. My research seeks to think through what is to be gained by examining the "disreputable" spaces of soca performance instead of keeping the focus on the reputable and legitimated styles of the political calypso. I ask what is the political work that is being done in these, in some ways marginalized, but in other ways extremely popular, spaces of performance.

One of the answers that emerges from the examination of soca and its relationship to the political calypso ideal is that these disreputable spaces are also the spaces for female and youth performances. Thus, dismissing these spaces also delegitimizes youth and female voices within the nation-state. It must be acknowledged that performances are not without their problems (though I have equally suggested that calypso performances are also problematic). Rohlehr's (1998) contention that soca performances often make women available for male consumption is right on the money. However, my examination of soca singer Alison Hinds' performance (Harewood, 2006) is not posed in the heroic, triumphant genre of the political calypso narrative. Rather, it seeks to examine the complex meaning-making strategies taking place in the new musics in the new spaces.⁵ How might we attend to different ways national identity is imagined in the performances of female performers and their fans? This is a key question, it seems to me, because of much of what I have outlined above – that only certain ways of imagining the nation have been legitimated in the dominant nationalist project. My work seeks to find ways to pay attention to the multifocal lenses through which nation and identity are performed.

In this section of the chapter I have paid some attention to the possibilities of the instability and multiplicity of meaning. I would also contend that the acknowledgment of this instability of meaning can lead to a reassessment of and return to one of the most important research strategies that has been used by calypso scholars – their willingness to read against the grain. Earlier in the chapter it was suggested that calypso scholars sought out alternative sources and strategically read the colonial archive. Given the problems outlined above, I believe that calypso scholarship can take up this strategy, this time reading across the grain of the dominant nationalist canon. For example, more critical engagement with the racial and gender hierarchies at play in calypso performance and within the calypso research can potentially

lead to a reassessment of the ways in which the category of “the people” has managed to narrow the definition of citizen (Harewood, 2008a, 2010). Part of this critical engagement must take a long hard look at an even more fundamental question: What are the pros and cons of examining the popular arts when colonial history has often meant that there has been a racialized and gendered division of labor around the symbolic arts? Within my own work I have sought to address this by looking at what factors shape the spaces of performance. However, more work also needs to pay attention to identifying the impact of particular definitions of “popular” and “popular arts” within the racialized environment of the Caribbean.

Conclusion

In this chapter I have sought to examine the productive nature of calypso research. The chapter seeks to examine, therefore, representation of calypso within the calypso literature and how this links to representational politics. The chapter has examined key themes that have come to the fore in calypso literature – the uses made of history and the significant place that the political calypso plays within the literature. I have sought to suggest that the calypso literature is an important part of the way in which calypso is assigned value. The discourses articulated within calypso research are part of the way in which calypso makes meaning, and, because calypso is so closely tied to representational government within the region, we should acknowledge the narrow conceptualization of citizenship that is articulated in the scholarship as having material effect on democracy within the region. Certainly the notion of citizenship presented in the calypso literature does not exist there alone. In fact, what I am drawing attention to is a societal, commonsense understanding of narrowed citizenship, and that we as scholars can attend to this by paying close attention to the relationship between calypso literature, calypso performance, and parliamentary practice.

Nevertheless, I have also suggested that calypso and soca offer counter-discourses that can challenge the dominant nationalist narrative and the emphasis on limited citizen participation. It is the contention of this chapter that paying attention to alternative ways in which the nation and ideas of national unity are being imagined through calypso and soca requires research strategies that try to focus on calypso and soca’s polysemy. Ultimately, my argument in this chapter has been one that has sought to think through the project of democracy within the Caribbean in part, as an imaginative project. Within this imaginative project the role of the academic is not only that of critic. The calypso scholar has always been engaged in a creative exercise. Thus the ability to read against the grain, to cultivate new sources of knowledge, and to demand visibility in the face of colonial erasure has played its part in the anti-imperialist work of the region. I would contend that these creative practices must be put to use in the ongoing project of freedom in the Caribbean.

NOTES

- 1 Britain ended its slave trade in 1807 and from that point on patrolled the area of the Triangular Trade in order to stop rogue slaving.
- 2 Soca music is a more contemporary style of carnival music that emerged from calypso in the 1970s. It tends to be marked by faster beats, recurring lyrics, digital music production techniques, and often fusions with other regional and international forms of music.
- 3 When I say “colonial” in this context I do not mean to suggest an unbroken line in which race and gender mean exactly the same thing today that they meant in the colonial period. Rather, I am seeking to highlight two things. First, the persistence of these forms of ordering – colonial hierarchies of race, class, and gender – but also international economic structures that continue to shape the contemporary period. This highlights the second reason I am using the term colonial – to highlight the flexibility of these concepts. Although the world changes, global capital changes too and constantly redeploys hierarchies as a continually changing strategy of survival.
- 4 Of course Trinidad and Tobago was a colony at the time; nevertheless, the sense of national unity and the desire for national self-government were certainly stirring.
- 5 My work also focuses on Barbados and the Caribbean diaspora rather than on Trinidad and the Caribbean diaspora, which is the focus of the bulk of calypso literature.

Technology, Convergence, and Power

Current Trends in Text-Based Approaches to Media Studies

Sharon R. Mazzarella

ABSTRACT

In this introduction, I provide a historical, methodological, and epistemological context for a discussion of the current state of text-only approaches to media studies as exemplified by the chapters in this volume. I begin with a discussion of the specific methodology of content analysis not to give it primacy, but rather for the sake of chronology. I then discuss more qualitative approaches to the study of media content and representation before justifying why text-only studies of media are relevant. Finally, I explain the organizational structure of the volume and introduce the individual chapters before offering concluding thoughts and future directions for media content studies, specifically, the need to: (1) continue to embrace and respect a range of methodological and theoretical perspectives; (2) remain open to evolving and refining our research questions as the technology and content evolve; and (3) acknowledge the potential of interdisciplinarity to make our scholarship more robust.

[M]edia texts present a distinctive discursive moment between encoding and decoding that justifies special scholarly engagement. The narrative character of media content, its potential as a site of ideological negotiation and its impact as mediated “reality” necessitates interpretation in its own right.

Studies of media content have been a staple of media studies since the field's beginnings. While many people erroneously use the phrase "content analysis" to refer to any and all studies of media content, there are actually a variety of ways to study such content, only one of which is correctly labeled "content analysis." The chapters in this volume come from a variety of methodological and theoretical approaches and highlight the richness of media content and representation studies. Moreover, they exemplify how such studies have evolved as media content itself has evolved. In this introduction, I provide a historical, methodological, and epistemological context for the chapters contained in this volume. I begin with a discussion of the specific methodology of content analysis not to give it primacy, but rather for the sake of chronology. I then discuss more qualitative approaches to the study of media content and representation before justifying why text-only studies of media are relevant. Finally, I explain the organizational structure of the volume and introduce the individual chapters before offering concluding thoughts and future directions for media content studies.

Quantitative Analysis of Media Content

According to the author of one of the leading content analysis textbooks, Klaus Krippendorff, "Content analysis is a research technique for making replicable and valid inferences from texts (or other meaningful matter) to the contexts of their use" (2004, p. 18). While Kimberly Neuendorf, author of the highly influential *The Content Analysis Guidebook*, offers a more extensive definition later in her book, she begins with the following brief definition: content analysis is "the systematic, objective, quantitative analysis of message characteristics" (2002, p. 1). Similarly, in yet another key content analysis methodology textbook, Daniel Riffe, Stephen Lacey, and Frederick Fico define the approach as "the systematic assignment of communication content to categories according to rules, and the analysis of relationships involving those categories using statistical methods" (2005, p. 3). Words like "systematic," "objective," "rules," "categories," "quantitative," "replicable," "valid," and "statistical method" evidence the connection between content analysis and the scientific method employed in the subset of media studies that grew out of the social and behavioral sciences.

While Krippendorff traces the concept of content analysis back even as far as seventeenth-century Europe, the precursor of modern content analysis is generally considered to be the "quantitative newspaper analysis" (Krippendorff, 2004, p. 5) of the early twentieth century. At that time, US journalism schools were established paralleling a public and scholarly concern about the content of newspapers. Early studies such as Mathews's 1910 piece documenting the large amount of space allotted to what he termed "demoralizing," "trivial," and "unwholesome" content in US newspapers arrived at their conclusions by measuring column inches devoted to

particular topics (as cited in Krippendorff, 2004, p. 5). As other forms of mass media emerged in the early and mid-twentieth century, the quantitative techniques of early newspaper analysis were translated to study the content of other media. Neuendorf (2002), for example, identifies Edgar Dale's 1935 content analysis of the written descriptions of some 1,500 movies released in 1920, 1925, and 1930 as such an example. Published as part of the classic Payne Fund Studies, Dale documented Hollywood's reliance on love and crime stories. Krippendorff identifies the 1930s and 1940s as "the second phase in the intellectual growth of content analysis" (2004, p. 6). Paralleling the rise of the development of the social sciences, public opinion research, and theoretically grounded social research, scholars of media content expanded the range of questions asked about the content, incorporated theory and operational definitions to guide their research, and utilized new statistical tools. In addition, content analysis was used as part of larger research projects incorporating other methods such as survey research (Krippendorff, 2004). Certainly, the Payne Fund Studies mentioned earlier would be an example of this, as that body of work included experimental, survey, interview, and autobiographical case studies along with content analysis to provide a comprehensive picture of the relationship between audiences and films at the time. According to Krippendorff, the first "concise presentation of these conceptual and methodological developments under the new umbrella term *content analysis*" appeared in a 1948 report by pioneering communication scholars Bereleson and Lazarsfeld titled *The Analysis of Communication Content*. Krippendorff argues that "this first systematic presentation codified the field for years to come" (2004, p. 8). Content analysis was successfully used to study propaganda and wartime messages before and during World War II (seen notably in the work of pioneering communication scholar Harold Lasswell), and by the end of the war, its benefits became obvious to scholars in other disciplines including psychology, anthropology, and history among others. Content analysis still remains a staple in media studies. In fact, in her 2002 textbook, Neuendorf described content analysis as "the fastest-growing technique over the past 20 years or so" (p. 1).

Qualitative Analysis of Media Content

According to Neuendorf (2002), "with regard to content analysis, there seems to be a widespread but wrongheaded assumption that 'anyone can do it' with no training, and there also seems to be another common misperception that any examination of messages may be termed a content analysis" (p. xv). Furthermore, many approach content analysis as an easy project only to discover that it is unexpectedly difficult with issues such as operationalization, inter-coder reliability, and statistically significant measures being some of the few elements of a well-carried-out research project. In addition to content analysis, media studies scholars use a variety of more qualitative techniques whose roots are found not in the social and behavioral sciences, but

rather in the humanities – literary theory, film/cinema studies, and critical/cultural studies. While content analysis is one specific methodology, there is a range of qualitative approaches used by media studies scholars. I stop short of calling them “*qualitative* content analysis” because that implies that (quantitative) content analysis is the original and more valued, while *qualitative* content analysis is an afterthought. It is comparable to the trend of universities calling their men’s teams the Tigers, for example, and their women’s teams the “*Lady* Tigers,” implying that the men’s teams are the original, and the women’s teams are second fiddle. (Which, in terms of funding and media exposure, they often are, but that’s another story.)

In 1996, Ellen Hijmans offered her typology of qualitative approaches to the study of media content. The first is *rhetorical analysis* or *rhetorical criticism*, which has its origins in Greek philosophy, notably the work of Aristotle. It focuses less on what communication messages say, and more on *how* the message says it – on the rhetorical strategies employed. While used in media studies, rhetorical analysis is employed more often in communication studies to analyze non-mediated messages. *Narrative analysis*, derived from literary theory, focuses on the “formal narrative structure” (Neuendorf, 2002, p. 5) of stories, for example Propp’s canonical analysis of characters in Russian fairy tales (1968) which established now-classic character archetypes such as hero, villain, helper, and so on. *Discourse analysis* focuses on the use of words and manifest language. It is used often in analyses of public communication, typically to study phenomena such as speech, conversations, and the like. *Structuralist/semiotic analysis*, for example, the influential work of Roland Barthes, is related to linguistics and focuses on latent meanings, signs, sign systems, and symbols. *Interpretive analysis* emphasizes forming theory from the observation and coding of messages.

In addition to the above as documented by Hijmans, Neuendorf (2002) identifies other qualitative approaches including *conversation analysis*, which is the analysis of “naturally occurring” conversations – interviews, for example. She also identifies what she calls *critical analysis*, which has its roots in cultural studies and film studies, and which can be seen in many of the chapters in this volume. Such studies incorporate a range of critical/cultural theories such as feminist theories, critical race theory, political economy, and so on. In fact, they may also incorporate one or more of the approaches already identified by Hijmans. Fürsich (2009) and others use the term “textual analysis” to broadly refer to such studies (while that phrase is often erroneously used as a synonym for “content analysis”).

Such “qualitative reading strategies” (Fürsich, 2009, p. 240) assume the subjectivity of the researcher (in comparison to the emphasis on objectivity employed in content analysis). Moreover, textual analysis goes “beyond the manifest content of media, [and instead] focuses on the underlying ideological and cultural assumptions of the text” (Fürsich, 2009, p. 240). According to Kellner (2010), “Each critical method focuses on certain features of a text from a specific perspective.” For example, Marxist scholars focus on representation of class, while feminist scholars focus on gender portrayals. Critical race scholars examine representations of race and ethnicity while those grounded in queer theory address ideologies of sexuality.

Interestingly, some within the fields of media and cultural studies have criticized text-only-based approaches as providing an incomplete picture of the mediated landscape. For example, in 2007 Greg Philo of the Glasgow University Media Group argued that such approaches are deficient in that they fail to include analysis of production and audience, what du Gay and his colleagues have called the “circuit of culture” (1997). While acknowledging the advantages of such holistic approaches, Fürsich argues that “only independent textual analysis can elucidate the narrative structure, symbolic arrangements and ideological potential of media content” (2009, p. 239). Text-only media studies do not assume the roles of the producers or the audience are unimportant, but rather acknowledge that texts are a dynamic and rich source of ideological messages that warrant deconstruction. As Fürsich reminds us, “The question (guiding textual analysis) is not how accurately does the text reflect reality but what version of reality is normalized and as a consequence, how emancipatory or hegemonic is the text” (2009, p. 249). In fact within media studies, “reflection” is not a useful term as it implies a direct correspondence between reality and media, something that mediation challenges intrinsically.

Interestingly, while this volume is specifically on media content and representation, and while other volumes in this larger project focus on production and audience, some of the chapters in this volume *do* address the role of producers and audience in addition to content. Clearly, there is room for a range of approaches to the study of media content, and many scholars choose to carry out a combination of approaches throughout their career or within one particular research project.

Content and Representation

This volume is purposely titled “Content *and* Representation.” While it includes overviews of scholarship out of the social/behavioral science tradition of (quantitative) content analysis, it also includes numerous chapters coming from a more critical/cultural tradition, the latter of which has been extensively (although not exclusively) concerned with issues of representation; what Stuart Hall defines as “the production of meaning through language” (1997, p. 16). (Language, of course, is broadly defined to include the language of mediated artifacts.) Hall writes extensively about the constructivist or constructionist approach in which “it is not the material world which conveys meaning; it is the language system, or whatever system we are using to represent our concepts” (1997, p. 25). Such an approach can be seen, for example, in the work of French philosopher Michel Foucault and media studies scholars employing a Foucauldian approach, as do some of the authors in this volume.

At the heart of many studies of representation, including those from a Foucauldian perspective, is the issue of power. Who has the power to represent themselves and others? How is power represented in mediated texts? How do representations laterally reproduce or challenge power? A grounding in the “politics of representation” often

guides media studies scholarship examining how particular groups – women, transgendered people, teenagers, Latino/as, and so on – are represented. The questions asked are not so much whether such portrayals are positive or negative, realistic or unrealistic, biased or unbiased, but rather how such portrayals are constructed ideologically. In fact, as Angharad N. Valdivia points out, media studies has moved beyond such “binary approaches” (2010, p. 74). The chapters in this volume, whether employing a content or textual analysis approach, evidence this turn to more complex analyses of representation and power.

Volume Structure

Organization

While this volume could have been organized in any number of ways – theoretical, methodological, epistemological, conceptual – I chose to organize it by focusing on the function of the content studied: (1) Persuasion and Information, (2) Entertainment, and (3) Interaction and Performance. In this age of convergence and boundary blurring (advergames, anyone?), it may seem archaic to use such an organizational structure, but I chose to organize the volume this way for a variety of reasons. First, it links to the history of how studies of media content evolved. Recall that early content analysis, for example, focused specifically on journalism (informational media) and then matured through studies of propaganda (persuasive media). This was followed by its use in studies of entertainment media – radio, film, and television. Finally, the evolution of media technology itself has been toward the creation of more interactive forms of media including the Internet and videogames, to which media studies scholars have now turned their attention.

While intention often guides content creation such that historically content intended to persuade had been quite different from content intended to entertain, today, as McAllister and Smith remind us in Chapter 1, one of the biggest trends in media content is the blurring of persuasive, informational, and entertainment messages as seen in the phenomenon of hypercommercialization. This is why this chapter opens the book – because it addresses this big-picture trend. I also chose to close the book with the section on interaction and performance because it too speaks to one of the most important recent trends in media content – the role of the “audience” in producing and/or interacting directly with media content.

Scope

In addition to including both qualitative and quantitative approaches to media content studies, this volume offers a range of additional distinguishing features beginning

with its international scope. Authors in this volume are based in 10 different countries – Belgium, Canada, Hong Kong, Israel, Mexico, New Zealand, Spain, Sweden, the United Kingdom, and the United States. In addition, the scholarship presented addresses media content found in an array of geographic areas ranging from Europe to Latin America, from the Middle East to the Caribbean, and from Asia to North America. Topics covered are also diverse, ranging from advertising and journalism to popular television and film; from music to videogames; and from blogs to place-based media.

This volume approaches content studies broadly. Not only does it include chapters from both the textual analysis and content analysis traditions, but the format of the chapters also varies. Some chapters are reviews of the literature while others are case studies. Essays also evidence the broad array of theories and intellectual concepts that ground content and representation studies – cultivation, feminist, hegemonic masculinity, political economy, poststructuralism, othering, Orientalism, hegemony, and so on.

At first glance, the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008). While these seven chapters focus on females, they also address other issues including blogging, representation of nations, branding, and science.

As is representative of the field, most of the chapters are analyses of media/cultural content produced for mass audiences, yet some focus on content produced by individuals (e.g., bloggers, videogame players, musicians). In fact, it is the chapters focusing on these topics that force us to rethink the way we define media content, in particular with videogames where the “audience” (aka “player”) plays a role in creating the content.

In the course of editing this volume, it quickly became clear that other artificial distinctions such as those related to production or audiences or effects or content are also problematic. Several of the essays in this volume do go beyond the text-only approach and take into account one or more of these other factors. Through her archival research, Miranda Brady, for example, provides extensive background on the decision-making processes behind the introduction of place-based media in museums and how such decisions affect Indigenous representations. Katalin Lustyik and Ruth Zanker include a great deal of information on the structure of the children’s networks they study. In addition, they have conducted extensive interviews with network officials to more fully understand children’s television content. Similarly, other authors make reference to the potential effects of the content studied (Steinke, Signorielli, and Robinson et al., for example), while other authors such as Kenneth Lachlan and Mia Consalvo challenge us to think differently about how we study videogame content – specifically, the fact that the “audience” (i.e., the player) influences content.

Many of the chapters in this volume evidence the way media studies content and representation scholarship intersects with other fields, including Latino/a studies, game studies, women's studies, cinema/film studies, queer studies, sport studies, masculinity studies, and so on. This interdisciplinarity brings a richness and depth to media studies content and representation scholarship that adds to its relevance in a multi-cultural, global, and technology-driven world. Taken as a whole, then, the chapters in this volume evidence the multiplicity of ways in which media studies scholars approach the study of media content and representation.

Introduction to the Chapters

Part 1: Persuasion and Information

The first section of the book, "Persuasion and Information," returns us to two of the earliest concerns about media content – advertising and news. The section begins with three chapters on advertising. While the first one provides more of an overview of current trends related to hypercommercialization, the other two chapters focus on two of the most frequently researched subtopics related to advertising content – portrayals of women and advertising to children.

In Chapter 1, "Understanding Hypercommercialized Media Texts," Matthew P. McAllister and Alexandra Nutter Smith take a big-picture look at one of the most important media trends in recent years – the global phenomenon of hypercommercialization. Beginning as early as the 1980s, hypercommercialization is best described as commercial messages and imperatives invading other forms of culture, resulting in such hybrid cultural artifacts as advertorials, advergames, infomercials, branded school books, and so on. McAllister and Smith argue that such artifacts are "messy," thereby blurring the distinction between advertising and other forms (e.g., news, entertainment, education). They conclude with a discussion of what they see as the future trends in hypercommercialization, mostly related to the Internet.

Focusing specifically on the US context, Nancy A. Jennings examines the research on children's advertising in Chapter 2, "And Now a Click from Our Sponsors: Changes in Children's Advertising in the United States." Jennings puts US children's advertising into a broader context by discussing the legal regulations, the historical evolution, and the future directions of both content and scholarship. Focusing extensively on the current children's media environment in which marketers are moving more and more to the web to reach child consumers (for example, the kind of advergaming that McAllister and Smith include in their description of hypercommercialization), Jennings reminds us that "convergence" seems to be the watchword best describing children's advertising today. She concludes with a call for research on the branded environment in which children grow up.

Continuing with a focus on persuasive messages, Paloma Diaz Soloaga and Carlos Muñiz examine “Women’s Portraits Present in Print Fashion Advertisements: A Content Analysis of Spanish Fashion Magazines from 2002 to 2009” in Chapter 3. Based on their analysis of hundreds of luxury brand advertisements in high-end Spanish fashion magazines, the authors document the persistent stereotype of presenting women as objects of pleasure – valuable only for their physical appearance.

The next four chapters in Part 1 focus on informative media content – news and sports. While the topics of each of these chapters differ, so too do their approaches as they incorporate a range of theoretical, conceptual, and methodological groundings – political economy, feminism, power, poststructuralism, content analysis, and discourse analysis.

In Chapter 4, “Marketing Militarism to Moms: News and Branding after September 11th,” Mary Douglas Vavrus provides the bridge between the persuasion and information subsections of Part 1. Informed by feminist theory, political economy, and branding research, Vavrus unpacks how the news media constitute and politicize identity brands such as that of the “security mom” – women/moms who are concerned with national security and who were projected to be a swing voting bloc in recent US elections. Vavrus shows how the security mom identity, which emerged during the 2004 US presidential election, took on the status of a brand that was then used to reproduce the patriarchal values and pro-war agenda of the US power elite at the time.

While Vavrus calls on Michel Foucault’s concepts of “biopower” and “governmentality” in her analysis of security moms, Marie Hardin and Erin Whiteside also invoke Foucault in their chapter “From Second-Wave to Poststructuralist Feminism: Evolving Frameworks for Viewing Representations of Women’s Sports” (Chapter 5). Hardin and Whiteside trace the evolution of scholarship on women’s sports, and demonstrate the potential of a poststructuralist/third-wave feminist approach to studying the topic in contrast to the more traditional, second-wave approach that had dominated the literature. Comparing the two approaches as being grounded in the way each conceptualizes power – either the Gramscian (second-wave) or Foucauldian (third-wave) approaches – and being careful not to devalue earlier scholarship on women and sports, the authors encourage future scholars to consider the potential of a poststructuralist approach.

While the Latin American cultural phenomenon of telenovelas has generated a significant amount of scholarship, Guillermo Avila-Saavedra examines not the content of the ubiquitous programs themselves, but rather US news coverage of English-language adaptations of four telenovelas for US audiences. In Chapter 6, “‘Honey-Drenched, Rags to Riches, Good versus Evil Stories’: The Telenovela as a Cultural Referent in the US Press,” he employs discourse analysis of mainstream US press coverage of these programs to document the coverage’s devaluing of the telenovela genre and its use of the genre as a cultural proxy for Latinos. As a result, Avila-Saavedra argues that the coverage created an “identity crisis” for the programs, contributing in part to their low ratings and quick cancellation.

Continuing the focus on news coverage of minorities, Eli Avraham addresses “Changes in the News Representation of Minorities Over the Course of 40 Years of Research” in Chapter 7. Focusing on a range of contexts – Israeli, European, and US – Avraham seeks to address how minority groups have been covered in the press; why the coverage has tended to be stereotypical; and the role of activists in influencing the coverage of their own group. He offers a model outlining the dynamic factors that affect the journalistic image of minorities: (1) the characteristics of the group (e.g., population size, geographic location, socioeconomic indicators); (2) editorial policy and “social-ideological distance” between journalists and the members of the group in question; (3) the social-political environment; and (4) the public relations strategies employed by the group activists.

The last chapter in Part 1 provides a bridge between the first and second sections in that it focuses on media content that is at once designed to inform (i.e., educate) and entertain – children’s television. In conducting case studies of three locally launched children’s television channels – TVNZ6 in New Zealand, Minimax in Eastern Europe, and Al Jazeera Children’s Channel in the Middle East – Katalin Lustyik and Ruth Zanker seek to answer the question: “Is There Local Content on Television for Children Today?” Through their case studies, the authors document the different ways each of these three channels has responded to media globalization. While the stations may still include “good” imported programming from abroad, they also provide locally produced programming that highlights local culture and traditions.

Part 2: Entertainment

The chapters in Part 2 highlight the intersections between media studies and other fields as mentioned earlier. They evidence the interdisciplinary nature of media studies, and the way in which media studies has crafted rich, nuanced approaches to the study of entertainment media content and representation.

The first chapter in Part 2 is Mary C. Beltrán’s “The Evolution of Hollywood Latinidad: Latina/o Representation and Stardom in US Entertainment Media” (Chapter 9). Focusing primarily on Hollywood films and US television programming, and informed by the broader literature in Latino/a studies as well as her own extensive body of scholarship, Beltrán’s analysis raises issues of Latino/a visibility, racialization, authenticity, Latinidad, hybridity, transnationalism, and self-representation. By focusing on the evolution of Latino/a stars decades ago ranging from Delores Del Rio and Carmen Miranda to more recently popular celebrities including Salma Hayek and Jennifer Lopez, Beltrán teases out the nuances and complexities of the representational politics guiding such images. She concludes with a discussion of the current marketability of Latinidad and the implications of such hypervisibility.

While the increasing hypervisibility of Latino/as in the media can be attributed, in part, to the growing purchasing power and size of the Latino/a audience, the

increased purchasing power of the LGBTQ community (in the United States, anyway) has impacted the increase in queer-focused programs (Streitmatter, 2009). Beginning with a discussion of what they see as the “theoretical richness and relevance” of queer theory, Sofie Van Bauwel, Frederik Dhaenens, and Daniel Biltereyst (Chapter 10; “Queer Gazing and the Popular: A Study on the Representational Strategies of Queer Representations in Popular Television Fiction”) analyze “moments of queer identity” and queer representational strategies in three globally successful television series typically considered as queer and/or including queer characters: *Queer as Folk* (UK), *The L Word* (US), and *Six Feet Under* (US). Deconstructing the texts’ signifying practices – specifically narrative and cinematographic elements – the authors document the queer signifiers present in each series. Throughout the essay, the authors argue for the importance of incorporating themes of queer representations in studies of media and popular culture.

Continuing with this section’s focus on representation, Heather L. Hundley addresses “Mediated Portrayals of Masculinities” in Chapter 11. The operative word in the title is the plural, “masculinities,” as influential scholarship in the sociology of gender reminds us that there is not one “masculinity” but rather a range of “masculinities” and that scholars “have to examine the relations between them” (Connell, 1995, p. 76). In her chapter, Hundley reviews how studies have examined a variety of masculinities in the media including hegemonic, hypermasculine, and metrosexual. Written in two sections, Hundley’s chapter begins by reviewing the literature on the evolution of media studies scholarship on US mediated representations of masculinities including the intersections between that topic and race, class, and sexuality. The second half of the chapter focuses on portrayals in each of a range of US media. Hundley argues that, despite the dramatic increase in studies of mediated masculinities in recent years, there are still notable gaps in the literature, in particular when it comes to the intersections of masculinities and other identities – race, class, sexuality, and so on.

While there are various types of masculinities, there are also various types of femininities. In Chapter 12, Sujata Moorti examines one type – “Shifting Contours of Indian Womanhood in Popular Hindi Cinema.” Through a detailed historical analysis from Indian colonial times (1896–1947) through the present, Moorti shows how, through the figure of “woman” in Indian cinema, larger social, cultural, and political issues have been worked out – for example, India’s struggle for self-reliance in the postcolonial era and anxieties about globalization in recent years. Interestingly, while she argues that current-day Bollywood films offer a limited representation of Indian womanhood (restricted primarily to a heteronormative focus on the family), earlier eras, in particular the colonial era, offered more possibilities for female subjectivity.

The discussion of possibilities for female subjectivity is at the heart of Jocelyn Steinke’s literature review, “Portrayals of Female Scientists in the Mass Media” (Chapter 13), as she examines the topic in relationship to broader cultural beliefs about the role of women in the workforce, specifically in the sciences. Focusing on the broader literature on the topic, as well as on her own scholarship specifically,

Steinke documents the way in which US media (e.g., films, television, Internet) historically have underrepresented and stereotyped female scientists. She links concerns about such portrayals to the broader concerns about the lack of women in science, engineering, technology, and math occupations, including evidence that cultural representations of science may play a role in defining such fields as “masculine.” Steinke concludes that, despite recent improvements in portrayals, there is still a long way to go.

While Moorti focused on cinematic constructions of Indian womanhood in Chapter 12, specifically on how such constructions stood in for broader national/cultural issues, in Chapter 14 (“‘She’s the Real Thing’: Filming the Nostalgic Past through Vietnamese Women”) Diem-My T. Bui analyzes representations of Vietnamese womanhood in three US-made films about Vietnam – *Heaven and Earth* (1993), *The Quiet American* (2002), and *Three Seasons* (1999). Bui focuses not only on the portrayals of the film’s female characters but also on media coverage of the actresses playing those roles in order to ask questions about “who speaks?” Grounded in the literature on othering and Orientalism, Bui unpacks how the female body in these films is constructed as an aid in returning to an “authentic” Vietnam – a nostalgic and exotic past that existed before the war.

While Moorti and Bui focus specifically on how womanhood is constructed to stand in for broader social, cultural, political, and national issues, in her chapter on “Chinese Cinema at the Millennium: Defining ‘China’ and the Politics of Representation” (Chapter 15), Gina Marchetti analyzes dozens of post-millennial Chinese-language films in order to understand how such films represent the Chinese “nation” as well as China’s evolving political economy. She argues that “China” is a contested concept in transnational cinema, and that in constructing China, filmmakers continuously return to the same themes – defining the nation, border crossing, the marketplace, political divisions and related controversies, as well as law and history.

The final chapter in Part 2, Nancy Signorielli’s “Violent Content on US Television: A Historical Overview of the Research” (Chapter 16), takes us in a slightly different direction than the previous chapters. Grounded in cultivation theory and part of one of the most prolific media studies research projects, Cultural Indicators, Signorielli reviews the literature on the topic from a historical perspective as well as from the perspective of very recent studies including ongoing yearly content analysis of US prime-time programming and the National Television Violence Study of the mid-1990s. Examining both the amount and context of violent portrayals, Signorielli shows that the level of violent television content has not changed greatly in that it remains an “important and significant” element of prime-time and children’s television content.

Part 3: Interaction and Performance

Part 3 highlights issues of interaction and performance, primarily but not exclusively as related to new media. In the first of two chapters about blogs (Chapter 17), Zizi

Papacharissi and Sharon Meraz look at the big picture in terms of the evolution of blog content. In their chapter “Blogging Culture: Content and Representation in Blogs,” the authors examine blogging as a form of sociocultural expression. Acknowledging the breadth and diversity of the blogosphere, the authors examine the plurality of both blog content and functions, notably as issues of self-representation intersect with race, class, and gender. Informed by the theories of Chantal Mouffe, Papacharissi and Meraz conclude with a discussion of the agonistic nature of blogs – highlighting plurality and conflict – and argue that bloggers are agonists of both the personal and the political.

Papacharissi and Meraz reference the increase in female political bloggers as well as girl bloggers who, they argue, use a personal lens to highlight their political experiences. It is precisely this phenomenon that Jenny Gunnarsson Payne addresses in Chapter 18, “Blogging the Third Wave? Citizens’ Media, Intimate Citizenship, and Everyday Life.” Situating her research within the growing body of scholarship on feminist media production, the author analyzes three specific Swedish feminist blog projects on such topics as bare female breasts, eating disorders, and motherhood/breastfeeding to show how they function as a form of feminist micro-narrative, or more specifically what sociologist Kenneth Plummer describes as “intimate citizenship.” The author argues that third-wave feminist bloggers such as those she studied are not so much *dis*-articulating feminism (in a postfeminist sense) as *re*-articulating feminism in an ongoing and continuous process.

The next three chapters in Part 3 focus on videogames. While much of the public attention and scholarship on videogames has centered specifically on violent content and/or the effects of such content, the three chapters in this section offer alternate ways of looking at games and gaming. In particular, all three chapters challenge traditional ways of studying game content. In her chapter “Videogame Content: Game, Text, or Something Else?” (Chapter 19), Mia Consalvo raises a range of methodological and theoretical questions related to the study of videogames – what she calls “the particularities of studying games.” Her primary goal is to answer the question of “how do games make meaning?” In so doing, she reviews the limitations of past approaches of studying videogame content and offers two case studies of her own to suggest more effective ways for scholars to study the topic. She concludes with a call for “situated” rather than global approaches to the future studies of videogames so that researchers can take into account the peculiarities of specific games.

Through his analysis of the role of the player in relationship to violent videogame content, Kenneth A. Lachlan in his chapter “Rethinking Violent Videogame Content: Conceptual Advances and Directions for Future Research” (Chapter 20) demonstrates the complexity of games, and argues that the tools, language, and methodologies employed in traditional content analysis research may not reveal the full complexity of game content. He argues that user attributes such as personality, past game play experience, how much the game replicates real-life environments, and a sense of “presence” for the player actually influence the content. Rather than traditional effects research, for example, which would look at how content influences audience,

Lachlan argues that research on videogames, including violent videogames, must incorporate the interface between game player and game parameters to understand how the player influences content. In other words, content should be a dependent variable – an outcome – and not a cause.

While Lachlan examines how player characteristics shape videogame content, Tanya Krzywinska in Chapter 21 focuses on “Transmedial Aesthetics: Where Form and Content Meet – Film and Videogames.” Specifically, through a case study of *Final Fantasy XII* as well as references to other games and films, she examines convergences and divergences between film and videogames to show how form can influence content. By focusing on concepts such as the “aesthetics of convergence,” narrative as form and content, as well as affect, movement, and time, the author shows how film and game each borrow from the other, while viewers/players bring their knowledge of one to their experiences with the other. She concludes by reminding us that, while games and films still have formal differences, this is one more example of media convergence.

While the previous chapters have focused on one or another specific medium such as the Internet or videogames, in Chapter 22 James D. Robinson, Teresa L. Thompson, Jeanine Warisse Turner, Robert R. Agne, and Yan Tian undertake a review of the recent literature of how health-related topics have been presented in a variety of media including newer media such as medical tourism websites, Japanese manga, graphic novels, young adult novels, and YouTube videos. By focusing their chapter, “Recent Trends in Research on Health Portrayals in the Media: From TV, Newspapers, and Magazines to Websites, YouTube, and Manga,” specifically on content analyses published over the past five years, the authors have documented three trends in health portrayals research: (1) the study of a wider variety of health topics; (2) more diversity in the theoretical grounding of such studies; and (3) a broadening focus of media outlets studied to include more international portrayals and more types of media channels. Certainly, this chapter could easily have fit into either of the two previous sections since it addresses informational/persuasive and entertainment media as well as interactive media, but a major point made by the authors is that audiences are looking more and more toward interactive media such as that provided by the Internet for their health information, and they remind scholars of the importance of studying such portrayals.

Continuing the focus on interactive media, Miranda J. Brady explores place-based media – specifically its use in the Canadian Museum of Civilization’s (CMC) First Peoples Hall (FPH). In her chapter “Canadian (Re)Presentation: Media, First Peoples, and Liveness in the Museum” (Chapter 23), Brady interrogates the role of place-based new media in Indigenous identity construction. Brady not only examines the content of place-based media itself but also conducts an in-depth analysis of archival documents related to the construction of the FPH and news coverage of the process. Grounded in her analysis, she reminds us that colonial power can be found in the act of representing Indigenous culture in Eurocentric

terms, in particular when the focus is on the museum visitors' experience of "liveness" and interactivity. While new place-based technologies offer opportunities to represent Indigenous people in new ways, Brady argues, they also "mask the contingent nature of representation."

Concluding the volume is Susan Harewood's essay "Calypso and the Performance of Representational Politics" (Chapter 24), which addresses not how calypso music represents but, rather, how calypso is represented in the literature about it. Her essay is a theoretically grounded examination of the academic discourse – specifically historical accounts – about calypso, and how that discourse is linked to representational politics. Harewood argues that histories play a role in the construction of a "national imaginary," yet such histories, while working to solidify the significance of calypso, have also functioned to reinscribe a narrow view of citizenship. So while calypso itself plays a role in the representational politics of the Caribbean, the academic discourse about calypso contributes to the ways in which calypso makes meaning. She calls for a rethinking of the colonial narrative of calypso's origins and evolution.

Conclusion

Taken as a whole, the chapters in this volume evidence the dynamic and vibrant nature of media content and representation studies. Scholarship in this area has evolved to actively address the evolution of media technology, trends in convergence in media content, and changes in the role of the audience in relationship to that technology and content. Media content and representation scholars no longer limit their research questions to binary oppositions of positive/negative or biased/unbiased, but rather have achieved a high level of complexity and nuance in their analysis. Moreover, scholars have reached out to other fields in order to ground studies of content and representation in a range of rich theoretical concepts. These interdisciplinary links add relevance and depth to studies of media content and representation, and have kept the field from becoming stagnant.

For the future, media content and representation scholars need to continue to embrace and respect a range of methodological and theoretical perspectives. We need to remain open to evolving and refining our research questions, and to consider that perhaps we need to ask new questions as the technology and content evolve. While celebrating the unique and important contributions of media studies, we also need to be open to what scholarship in other fields offers us, not because it is better, but because it is complementary. Thus, we need to acknowledge the potential of interdisciplinarity. Overall, it is an exciting moment in the scholarship of media content and representation, and this volume provides a glimpse into the current and future trends of such scholarship.

Media Studies

The Interdiscipline of the Present and the Future

Angharad N. Valdivia

Media studies is a rapidly growing, widely relevant, and evolving field – an interdiscipline (Valdivia, 2003). While some scholars have bemoaned the loss of focus on process and effects, especially on milestone studies (DeFleur, 1998), others find the breadth and porous contours to be conducive to a worthwhile intellectual pursuit (Sterne, 2005). To be sure, between 1998 and the present, there has been a huge growth in interpretive and critical approaches, which have nonetheless flourished in the margins as the effects paradigm – the stuff of milestones – has firmly retained its central place in the field, at least in the United States and the Netherlands. Indeed, efforts to map out the diversity of the field of communication (Craig, 1999, 2001), which we might call the broader umbrella for media studies, yield a multiplicity of sometimes overlapping and other times mutually exclusive approaches. The terrain of contemporary media studies acknowledges that most of us live in intensely mediated environments, so that Livingstone (2009) writes on the mediation of everything, and Hay (2000) writes of refrigerator studies. The former expands on how media and communication are “ever more crucial in today’s world” (Livingstone, 2009, p. 13), and the latter asks us – as a field over a decade ago, while continuing to encourage us (Hay, 2010, 2011) – to consider the broader web of networks to which other technologies, such as refrigerators and toasters, contribute in terms of routines and practices that serve to mediate the world for us. The latter line of questioning has proven immensely prescient as many of us live in highly networked webs of media and communication, where not only can our location be pinpointed at any given moment thanks to elements in our mobile technology, but also, if we chose to, we can broadcast a narrative of our location and other audiovisual bits of information constantly to many – such as our hundreds of Facebook friends and Twitter or Tumblr followers.

Nonetheless, whether we are talking of old media technologies or institutions (see Nerone, Volume 1, *Media History and the Foundations of Media Studies*), we are witnessing the constitution of new audiences and a shift in traditional audiences (see Parameswaran, Volume 4, *Audience and Interpretation*) through the invitation offered by seductive content in a dynamically converging and synergized media environment (see Mazzarella, Volume 3, *Content and Representation*). The effects of these technologies and content continue to be measured and studied (see Scharrer, Volume 5, *Media Effects/Media Psychology*). While media platforms and patterns of production are converging, enduring tendencies toward concentration of ownership and control of media industries coexist with the emergence of new patterns of labor, practices, and updated forms of exploitation (see Mayer, Volume 2, *Media Production*, as well as some chapters in Gates, Volume 6, *Media Studies Futures*). This is not surprising given the rapidly expanding new media and communications technologies, many of whose functions replicate previous technologies while other uses (and abuses) bring new possibilities, utopian and dystopian, to the fore (see Gates, Volume 6). Unexpected global locations of nodes of influences result in previously unsuspected transnational alliances and networks (Castells, 2009).

As an early caveat to this triumphal celebration of media, I must remind readers that most of the above sentiment refers to a media-rich group that luxuriates in a wealth of networks and technologies. Yet we must not forget that even as I write this introduction at the very end of 2011, fully 50% of the global population have intermittent access to electricity. Mobile telephony may be widely spread, but the radio remains the most reliable global medium (see the *Journal of Radio Studies*). Beyond the fact that it is cheap, it neither relies on nor requires electricity or literacy, in English or any language. Furthermore, despite our current fixation with digital, wireless, and mobile media technologies, in times of crisis – whether natural such as a huge earthquake or in wartime – when the electric networks are down and we are thrown back into old school forms of media and communication, radio returns to its central location as a reliable and essential medium. So before you continue reading this introduction, or continue to read any of the absolutely outstanding volumes of this encyclopedia project, go out and buy yourself a radio – one that is both electric and battery powered. You might never need it, but if you do, you will be very relieved to have it.

The fact is that media are everywhere, and nearly everyone shares lifelong experience with and expertise on particular forms of media. Dating back to the 1920s – as identified both in Nerone, Volume 1 and Mazzarella, Volume 3, the study of media has been multi-modal and heterogeneous. Theoretical and methodological complexity has grown since the Payne Fund Studies. International, transnational, and global perspectives have become absolutely essential. Not that they ever were not, but now that media are produced, consumed, and circulated transnationally, media studies has to take this into account. Inclusivity of the heterogeneous components of the population in regard to the media has also grown. Scholarship that was once nationally bound and focused on White middle-class males has expanded to take into consideration gender, nation, region, age, ethnicity, sexuality, ability, and class.

Furthermore, as both Downing (2003) and Castells (2010) remind us, we must not forget the importance of religion in the contemporary world, as many armed conflicts revolve around religion, and media content, production, audiences, and effects are interlaced with religious impulses.

Media studies is an interdiscipline. As such it draws on and benefits from a number of contributing fields such as history, philosophy, psychology, political science, education, literature, and sociology. Yet even as it draws on those many fields, it is its own area of studies. Too often other fields, whose interdisciplinarity takes them into media studies, see this interdiscipline as new – as in, “oh look, we just discovered that we ought to look at media.” Our field becomes the direct object of other scholars’ deployment of the myth of discovery. Just like Columbus discovered “America,”¹ scholars from other fields continue to “discover” media and media studies. A century’s worth of theories and research disappears in the process, and many of us often find ourselves in other disciplines’ conferences listening to presentations that implicitly suggest direct effects, transparency, mimetic images, and so on. Transparency, when media content, industries, audiences, and practices are treated as if they spoke for themselves, as if there were no mediation, is often the tactic taken by scholars outside our discipline. What we as a field contribute to the understanding of culture and society is, at the very least, that mediation is complex and that understanding mediation helps us to uncover patterns of power, distribution, and potential justice. Media studies is about unearthing and maximizing the democratic potential of practices, institutions, technologies, and audiences that pervade our contemporary life.

Nonetheless, as Gates reminds us in her introduction to Volume 6, one central question for both the present and future of media studies concerns the very definition of media: What counts as media now that it no longer makes sense to limit the term to film, television, audio, and print? Does it still make sense to refer to a broad concept or category of “media”? If the more appropriate terms are “digital media” or “new media,” then what do *these* terms encompass? Terms like “convergence,” “remediation,” “interactivity,” and “user-generated media” capture a general sense of current transformations, but what are some productive ways of parsing out the complex dimensions and issues that these terms encompass? By paying careful attention to issues of history and context, this encyclopedia seeks to trouble the usage of these terms even as they are used rather carelessly in popular culture and public policy.

The six separate volumes of this encyclopedia were present as six separate sections in *A Companion to Media Studies* (Blackwell, 2003), the volume that provides the model for this encyclopedia and that was, in turn, modeled after McQuail’s *Mass Communication Theory*. The editors of the individual volumes put together a stellar cast of authors who in turn produced original chapters. All volume editors were asked, indeed implored, to compose a table of contents that was inclusive in many ways. First, inclusivity in terms of global topics was paramount, and we strived for inclusivity in terms of authors and global regions as well. This, as I have discussed elsewhere (Valdivia, 2011b), is not as easy as it sounds. Differential access to the latest research, culturally different approaches to writing and developing an argument,

resources that might enable a given scholar or team to develop a project and get it ready for publication, and so on, are all variables that effectively discriminate in favor of those of us in well-funded research universities in wealthy countries. We recruited some scholars whose work we translated into English, and all editors worked assiduously to cast as global a network as possible.

Another element of inclusivity was paradigm diversity. Schooled at the Institute of Communications Research (ICR) at the University of Illinois, I am the recipient of an educational tradition that highly values paradigm inclusivity. Insofar as it was possible, we included scholars using quantitative and qualitative approaches, sometimes both of them at the same time. Obviously the *Media Effects/Media Psychology* volume focused solely on the social scientific tradition, while both the *Content and Representation* and *Audience and Interpretation* volumes included scholarship using both approaches. A third element of inclusivity was gender, race, and sexuality diversity. Cutting across as a focus that can be conducted in the research included in any of the six volumes of this project is the work of transnational feminism and globalizing gender studies (Hegde, 2006). Editors sought scholarship that would include these vectors of difference, as media studies really makes no sense without their consideration. Yet even within each of these categories we encounter new gaps that merit more research. For example, as Mazzarella mentions in the introduction to Volume 3: “the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008).” The rise of masculinity studies follows feminist studies as a logical move once we realize that femininity is socially constructed. Indeed, this is a process that this collection of volumes entices us to accomplish: a greater degree of preciseness to this complex concept of media studies, which all of us who work within the interdiscipline intellectually seek to explicate.

As a final note about process, these volumes have been peer reviewed in an innovative manner for an edited collection. First, each table of contents was submitted to the peer review of a senior scholar within that area of the field and edited accordingly. Then, as the chapters came in, within each volume authors reviewed other chapters. Ideally, each chapter was reviewed by two other authors as well as by its editors. As the overall editor of the project, I carefully reviewed all volume editor introductory chapters. Now the review process is turned over to you, the reader.

Media Studies Today

As an organizing principle for this book, I have followed since 2003 the structure provided by many different editions of Denis McQuail’s *Mass Communication Theory*:

An Introduction. Dating back to the first edition in 1983 and up to the sixth edition in 2010, whose name has changed, appropriately enough, to McQuail's *Mass Communication Theory*, Denis McQuail provided a manageable way of dividing up the field into components that, while overlapping – as they had to be since these components were teased out more for scholarly inquiry than because they are discrete and differentiated – provided a useful way to look at the breadth of study of the media. We all experience media as an integrated experience. Media inherit values and histories that are in turn explicitly or implicitly incorporated into their production; then we either consume and/or interpret media in relation to regimes of representation, with particular audiences and interpretive tactics in mind, with some desired effects over which we have little control, and contributing to a future that – like effects – we wish we could influence but really cannot. Still for the purposes of research, we tease out the media experience into a number of areas.

The volumes of this encyclopedia match the sections of the *Companion*, which used McQuail's schema and added the “futures” section. Thus we have history, production, content and representation, audience and interpretation, media effects/media psychology, and futures. We will later add a “methods” volume to complete the encyclopedia. While these areas are teased out for the purposes of research, there is great cross-pollination by scholars in media studies. We find that some scholars use both qualitative and quantitative methodologies, or at least rely on both. We also find that many scholars write about two or more of the six areas mentioned above. In fact, many of the major trends in current research encompass holistic media studies approaches. Among these contemporarily salient research projects are network analysis (e.g., Castells, 2009, 2010; Chan, 2007, 2011, forthcoming; Gilbert, Karahalios, & Sandvig, 2010); girl studies (Banet-Weiser, 2011; Durham, 2004; Projansky, 2007a, 2007b, 2010; Valdivia, 2008, 2009, 2011a); transnational feminism (Hegde, 2006; Molina Guzmán, 2010; Valdivia, 2011b); and neoliberalism as an undergirding framework of analysis (Banet-Weiser, 2011; Hay, 2000, 2010, 2011; Hoerl & Kelly, 2010; McCarthy, Pitton, Kim, & Monge, 2009). McCarthy (2011) expands the focus of neoliberalism in media to the educational system and the efforts of many cities, such as Chicago, to become a cosmopolitan, globally vibrant center of economic activity, thus linking media studies to educational policy studies.

Many of these recent research tendencies converge in the critical examination of the “posts.” Scholars develop amazing analyses demonstrating the potential of an intersectional approach that uses race, ethnicity, gender, ability, sexuality, and class all at once, for people experience these elements in an integrated manner. Roopali Mukherjee's *The Racial Order of Things* (2006) set the bar for intersectional analysis of the “post-soul” era. Tasker and Negra (2007) provide a comprehensive introduction to the political implications of postfeminist culture, while Molina Guzmán and Valdivia (2004) apply the intersectional approach to the study of celebrity Latinas. Joseph (2010), in her provocatively entitled “Tyra Banks is Fat!” (a title that, to be fair, comes straight out of tabloid magazines and television coverage), explores the implicit racism and sexism of the postracial and postfeminist veneer of reality

television in general, and Tyra Banks's brand in particular. Molina Guzmán (2010) explores the transnational deployment and commodification of the Latina body, both spectacular and everyday. The politics of the post appears in all elements of media studies as these scholars foreground media studies even as they situate their work within a broader context of geopolitics and the dynamically changing mediascapes. While it may be fashionable to suggest the end of media studies, just as others have previously declared the end of history or of ideology, what this encyclopedia convincingly illustrates is the field's ability to expand as new practices, technologies, and institutions arise. As many of the editors and contributors will document, "new media" is a misnomer as neither the technology nor the uses or assemblages are so new (see Morley, 2006). What at first may seem to be epochal breaks are revealed by many of the contributors to be far more continuous elements in relation to history, culture, and media.

Editors and Volumes

We begin with normative theories and history. **John Nerone**, author of *Violence Against the Press: Policing the Public Sphere in US History* (1994), co-author, with Kevin Barnhurst, of *The Form of News: A History* (2001), and co-author and editor of *Last Rights: Revisiting Four Theories of the Press* (1995), as well as author of many other journal articles and book chapters, is the perfect historian to lead us through this fertile terrain of scholarship. Volume 1 on history underscores that while all media have long histories, historians agree neither on the definitive tale of origin nor on the particular historical approach. Moreover, Nerone, the careful historian, alerts us to the fact that even our use of the word media in relation to communications is quite recent.

Nerone's volume includes normative and historical approaches. Historical research, drawing on normative frameworks or not, continues to offer media studies scholars great insight and tools with which to understand contemporary media. Furthermore, there is great diversity within historical approaches to media studies. Beyond cultural memory and special effects as components of media history, we are also witnessing an explosion of careful work that revisits the archive, data, and documentation. Kafka (2009) brilliantly studies that most elemental component of media – paper. It seems like such a simple task: how do we study the construction and use of paper, the "bureau" in bureaucratization, the work of scribes? Kafka concludes that: "As scholars continue to research the history of paperwork, we need to keep in mind that we are defending not only the 'historical record,' but the political one" (2009, p. 352). Indeed, these are the perfect words to keep in mind as we read the volume on history so elegantly crafted by John Nerone.

Volume 2, *Media Production*, is composed by **Vicki Mayer**. Among the many publications by Mayer, we can list *Below the Line: Producers and Production Studies in the New Television Economy* (2011), *Producing Dreams, Consuming Youth: Mexican Americans and*

Mass Media (2003), and *Production Studies: Cultural Studies of Media Industries* (co-edited with M. J. Banks and M. T. Caldwell, 2009). Mayer begins her volume by reminding us that “[M]edia production is frequently the most invisible aspect of our relationships with media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how.” We expect to find, and we are not disappointed, a combination of keen attention paid to the sociological approach to our field, something about which McQuail had previously written in *Towards a Sociology of Mass Communications* (1969), and the more critical analysis of neo-Marxist political economy now accompanied by a focus on labor issues in the global setting. Moreover, as explicitly stated in one of her book titles, Mayer paradigmatically maintains a dialogue between political economy and cultural studies, an approach that resonates with globally used approaches in our field. The tension between structure and agency pervades this fine volume. Mayer remarks that “[I]f the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers.” So the new production studies is global by necessity as transnational ownership and production of media industries cannot be denied; blends political economy and cultural studies; foregrounds issues of labor, both above and below the line; and takes up issues of networks, intellectual property, and subjectivity as producers are constructed in terms of categories of identity.

Sharon Mazzarella, a prolific scholar of issues of youth and the media, leads us through the wide world of “content and representation.” Author or editor of books including *Girl Wide Web 2.0: Revisiting Girls, the Internet, and the Negotiation of Identity* (2010), *20 Questions about Youth and Media* (2007), *Girl Wide Web: Girls, the Internet, and the Negotiation of Identity* (2005), and *Growing Up Girls: Popular Culture and the Construction of Identity* (2001), Mazzarella is a rigorously trained social scientist who also pursues qualitative research. As such she is the ideal editor for this volume, which is respectful of both of those methodological approaches. Indeed, for many a budding media studies scholar, content and representation provide the first point of entry, as these are the aspects of media that we experience most directly. Although, of course, all media have normative implications, histories, and a complex web of production, most people focus on the finished product: the television show, the movie, the blog, the social media website, the song, the newspaper, the advertisement, the catalogue. Content analysis is alluring yet amazingly difficult to carry out. Representational analysis also bears the sophistication of a range of theories. Neither is an easy task, and quantitative approaches complement interpretive studies. Mazzarella presents a persuasive argument as to why content/representational analysis remains an essential component of media studies and why projects that are well carried out tell us much about the world and the circuit of culture. Unsurprisingly, this area of research continues to be plentiful.

Radhika Parameswaran edits Volume 4 on audience and interpretation. Parameswaran’s research includes two long articles in *Journalism and Communication*

Monographs, “Melanin on the Margins: Advertising and the Cultural Politics of Fair/Light/White Beauty in India” (2009, co-authored with K. Cardoza) and “Global Media Events in India: Contests Over Beauty, Gender, and Nation” (2001). Her work has focused on the intersection of feminist cultural studies, gender and media globalization, South Asia, and postcolonial studies with a particular emphasis on issues of audience and interpretation. As such she constructs a volume worthy of her areas of expertise, with plenty of chapters illustrating global and gender issues. This volume also bears the traces of an interdisciplinary field that includes social scientific paradigms such as uses and gratifications as well as more humanist approaches that now include global and online ethnographies. Parameswaran remarks that “audience studies has not only survived the backlash against its populist tendencies in the late 1980s to mid-1990s, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception.” “Populist tendencies” refers to the “discovery” of the audience around every corner, as it were, without proper attention to issues of power and structure. In the contemporary moment, audience studies is vibrant and innovative. Whether we look at fans or online digital communities, to mention just two of the many possibilities, the construction and potential agency of the audience are major issues that continue to guide the production of media and subjectivities. Illustrative of the many philosophical quandaries undergirding the location of the audience within media studies is Jack Bratich’s chapter in Volume 6, as audience analysis is part of the present and future of the field. In addition, audience connects with issues of production as it undeniably takes labor to be part of any audience.

Erica Scharrer guides us through the fifth core component of media studies, media effects and media psychology, the dominant paradigm in the United States as well as in other global settings such as the Netherlands, and the paradigm that reaps the most funding in a positivist framework that values scientific demonstration of impact. Scharrer has co-authored, with G. Comstock, *Television: What’s On, Who’s Watching, and What it Means* (1999), *The Psychology of Media and Politics* (2005), and *Media and the American Child* (2007), and, with L. Weidman and K. Bissell, a long article in *Journalism and Communication Monographs*, “Pointing the Finger of Blame: News Media Coverage of Popular-Culture Culpability” (2003). Scharrer brings to the volume on media effects/media psychology a long-standing engagement with the social scientific paradigm in our field. A well-carried-out effects study tells us much about the influence of media on individuals, groups, and societies. The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before. Thus Scharrer asks: “Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending time with media? What are the consequences of such media use? What factors and

conditions help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses?" These questions require complex methodological and theoretical expertise to answer. Many of us were schooled in a critique of the "hypodermic needle" model, though we have since learned that the media sometimes have or generate direct effects. Why else does a multibillion dollar advertising industry exist in the United States? However, we continue to marvel at the long-term cumulative effects that are far more complex than we originally anticipated. Furthermore, effects scholars, such as many of those contributing to Scharrer's volume, seek to explore how to effect positive change as well as how to avert more nefarious outcomes.

Finally for now,² the encyclopedia concludes with Volume 6 on media studies futures edited by **Kelly Gates**. Gates's own research is the veritable embodiment of a focus on futures. Author of *Our Biometric Future: Facial Recognition Technology and the Culture of Surveillance* (2011) as well as co-editor with Shoshana Magnet of *The New Media of Surveillance* (2009), Gates studies the discursive formation of the wishful deployment of recognition technology with an "almost gleeful futurism" that suggests "if only" the systems were in place, before 9/11, for instance, our present and future would be different, better, and so on.³ Futures is, by definition, a transient category, as within 10 years the content of this volume will be the stuff of the present, or maybe even the recent past. As Raymond Williams has written, we cannot anticipate what will be an emergent media form until it is *post facto*. The futures volume takes up some of the issues around Internet, gaming, social media, mobile telephone in a converged media form, biopolitics, and digitalization technologies such as biometric body scans. Gates asserts that media studies needs to take seriously the possibility that *radical uncertainty and contingency* are the only features that define where media are and where they are headed. All of the chapters in this volume could be retrofitted into the other five volumes. Yet together they compose a vision of the field as it moves forward, taking up issues that date back centuries, engaging them with theories and modes of media that only apparently represent new terrain.

This is the state of the art of media studies. It is a field where we know better than to use the term "new" media – for all media are somewhat new but also very old in many of their aspects. Scholars in this encyclopedia take us back to the production of paper even as they bring us up to the latest technologies, assemblages, and institutions that arise to mediate our world. Contributors to this encyclopedia share the belief not only that media studies is an academic exercise, but also that by engaging in this important area of studies we are somehow contributing to a more just vision of the world. As the separate volumes build on each other, whether we are engaged in media at any of their analytical nodes (production, content and representation, audience and interpretation, media effects/media psychology), we are simultaneously linked to its history and its future. As a diverse heterogeneous field that is global, interdisciplinary, intersectional, multi-methodological, I cannot imagine a more exciting and potentially liberatory academic enterprise to be involved with.

NOTES

- 1 In this introduction and whenever possible, this encyclopedia uses “America” to refer to a continent and “US” or “United States” to refer to the country, unless we are quoting from scholarship that uses “America” otherwise.
- 2 A *Methods* volume is projected to be released at a later date, edited by Fabienne Darling-Wolf.
- 3 Few people know that Gates submitted her dissertation proposal the day before 9/11. What to the committee seemed like futuristic queries became the very real present within a period of 24 hours.

The Audience in the Graduate Curriculum

Training Future Scholars

Meenakshi Gigi Durham

ABSTRACT

Because media audiences are changing as technologies and populations change, ethnographic approaches offer nuanced and versatile ways of understanding the complex interactions between people and media. Although a quarter-century ago cultural theorists like Richard Johnson and Stuart Hall drew attention to the linkages among production, texts, and audiences, a great deal of research – especially student research – tends to center on texts. But texts are meaningless until they are interpreted by audiences; and, increasingly, audiences are producing texts for mediated distribution, which adds a new twist to our conceptualization of “the audience.” In this chapter I address the crucial issues that are to be raised in teaching audience research to graduate students – from access to ethics and power in the field, to data collection, to writing media ethnographies – and I discuss how these issues play out in the classroom and in supervised research contexts. I also tackle the problems of negotiating institutional support for long-term ethnographic work. All this material is illustrated through examples of ethnographic fieldwork conducted by graduate students, and I focus particularly on studies that raise sensitive methodological and theoretical questions.

Audience research is not for the faint of heart. The study of media audiences calls for energy, courage, determination, patience, flexibility, people skills, a sense of humor, and a spirit of adventure. Most graduate students in media studies – indeed most media scholars – are aware of these requirements, which is perhaps why so few of us actually undertake it. But the rewards of audience work are unmistakable, particularly with regard to our understanding of the real-world implications of mediated messages. Media scholarship is meaningless without audience research.

The pioneers of our field were acutely aware of this. “It is in its *discursive* form that the circulation of the product takes place,” wrote Stuart Hall more than a quarter of a century ago. “Once accomplished, the discourse must then be translated – transformed again – into social practices if the circuit is to be both completed and effective.” He added forcefully: “If the meaning is not articulated in practice, *it has no effect*” (Hall, 1980, p. 128). Richard Johnson (1986/7) emphasized the vital links among production, text, and audience in his groundbreaking “circuit model” of culture. “The ultimate object of cultural studies is not, in my view, the text, but *the social life of subjective forms* at each moment of their circulation,” he noted (p. 198). Katz, Blumler, and Gurevitch (1974) argued that “media researchers ought to be studying human needs to discover how much the media do or do not contribute to their creation and satisfaction” (p. 30).

But audiences are complicated: their negotiations of media texts are varied, enigmatic, contradictory, cryptic. We need complex methods in order to gauge the intricacies of audience engagements with texts – methods that probe the subtleties of message decodings and the identity politics that might motivate them, whether the latter relate to class, race, gender, sexual orientation, or to the complex combinations and permutations of these and other life circumstances that might predict and explain what media messages mean.

By comparison, texts are easier. Texts are static: they are in online databases, or on microfilms in libraries, or in archives. They sit politely and await the researcher’s arrival, and every time the researcher returns they are the same: they don’t grow old, change their minds, sicken, or die. It is usually not difficult to gain access to texts: at the most, one might need a university identification card, a library card, or a letter of authorization in order to get to them. Texts don’t object to the researcher’s presence; they don’t get cold feet and drop out of the study halfway through; they won’t be traumatized by the research; and they won’t sue the researcher later on.

Moreover, a researcher often doesn’t need to get out of his or her chair to study a text, especially in this era of near-universal online access to documents. That’s a tempting idea for many researchers who spend all their time in their chairs and at their screens anyway!

And, finally, there’s a god-like element to analyzing texts: you are in control of interpreting them. Your analytical methods are geared to interrogating the patterns, juxtapositions, and structural elements that convey meaning, and using those methods allows you to conclusively explain the text’s significance and impact.

Of course, audiences don't always read the texts the same way scholars do; and they don't read them as the text's producers do, either.

And there's the rub.

There would be no need of audience analysis if the media operated as a "magic bullet" and meaning were seamlessly transferred from producer to text to receiver, without any possibility of misapprehension. But slippages happen all the time: the car named "Nova" was seen by Latino audiences as one that wouldn't go (*no va* in Spanish); the Manson family found directives for murder in the Beatles' song "Helter Skelter"; the darkening of O. J. Simpson's face on the cover of *Time* magazine was viewed as racist by some readers, but not by others. The reinterpretation of media texts is a routine aspect of mediated communication, and in order to fully understand what the media mean in society, audience research is imperative.

Texts don't exist in a vacuum. They are, in a sense, alive: they connect with people in social circumstances in various ways; they are accepted, resisted, dismissed, rethought, adored; they motivate social action, policy, and legislation; sometimes they influence behaviors; sometimes they are derided as junk; sometimes they become iconic. We can't know about the social life of media texts unless we acknowledge that audiences are a crucial and dynamic element of the media system.

Confronting the System

It's challenging to convince fledgling scholars of these research imperatives. In-depth, qualitative audience work takes time to conduct – far more time than a quantitative analysis; and this fact results in longer times to graduation and in the need to extend the funding for such projects. These realities pose myriad bureaucratic obstacles, which both the students and the supervising faculty need to understand in order to facilitate more qualitative audience research in departments of communication and media studies. In anthropology or sociology departments, an extra year of funding, dedicated to fieldwork, may be built into doctoral programs, where the time demands and exigencies of ethnographic endeavors are more common and better understood. In order to foster media audience research, communication programs should also begin to see extended fieldwork as routine, and as a valued element. In communication programs, then, funds need to be set aside to offer longer term support to those students who will conduct field analysis; planning must be done with this recognition in mind. Alternatively, advisors can work with students to secure grant funding for such projects; federal, state, and local initiatives exist for ethnographic projects on topics salient to current government priorities. In addition, many universities are developing a growing commitment to globalization and to internationally focused research, so these initiatives may be tapped for support. Audience research *does* require more resources in order to be conducted, but finding funding sources is possible. Recently, a student on a master's degree course in our program at the University

of Iowa conducted fieldwork in the Arctic among the Inuit people, cobbling together money from a variety of funding sources – some internal (such as a small research grant from the university’s Student Government Association) and some external (a Fulbright scholarship) to stay in the Canadian Nunavut territory for several months (Gunderson, 2009).

Graduate faculties need to take such financial issues into consideration in their planning and budgeting, in order to conduct qualitative audience studies successfully. Second, university administrations need to be reminded that “time to degree” is not a valid or useful criterion in the evaluation of graduate programs. It is no secret that, at the University of Iowa, where I teach, many graduate programs are now in jeopardy: they are in danger of being eliminated as a result of a university-wide assessment that has used this factor (among others) as a criterion in judging graduate student success (Olsen, 2010; Task Force, 2010). But certainly disciplines requiring long-term fieldwork – anthropology, ethnomusicology, qualitative sociology, social work, and, yes, communication – must unite to explain to the administrative powers-that-be the irrelevance, and indeed the counterproductive nature of such a criterion. Long-term fieldwork produces the kind of rich, meaningful data that cannot be obtained in any other way, and it must be commended and supported.

Third, painstaking paperwork and protocols confront audience researchers. They range from following university procedures for “human subjects research” to securing permissions from potential study participants, from their institutional administrators, and sometimes from government entities. These preparatory measures have to be undertaken for the researcher’s protection as well as for that of the subjects. Graduate advisors and dissertation chairs need to take time to help their students understand the necessity of these procedures and to assist these students in completing such tasks in a timely fashion. Interdepartmental collaborations, discussion groups, or other networking opportunities can help graduate students feel supported in these rather tedious and daunting endeavors. It’s an extra effort, but the value of the research justifies the time that needs to be put in upfront.

It’s easy to see that, for all the reasons outlined above, textual analysis offers a safe and stress-free haven to many graduate students. And confronting the challenges of audience research creates even more quandaries: how does one identify the audience? What constitutes a valid audience population, especially in qualitative inquiry? How does one initiate contact with such audiences, once they are identified? And, on top of all that, there’s the specter of the university’s Institutional Review Board, whose criteria have grown more draconian over time. So – is audience research really worth the hassle?

It’s essential for media scholars of the future to recognize that it is. Media studies are incomplete without audience research. Moreover, fieldwork can be fun. Leaving the academic environment to venture into dormitory rooms, high school cafeterias, homeless shelters, newsrooms in Hawaii, call centers in India, or villages in Africa offers new experiences, exciting encounters, unexpected epiphanies, and opportunities for both professional and personal growth. It is my view that the best audience

research requires immersion in often unfamiliar settings and situations. The outcomes of such research are incomparably rich, and they make invaluable contributions to the scholarship in our field. Thus this chapter will focus on qualitative, field-based studies of audiences because of their potential to yield nuanced, detailed, and in-depth understandings of how audiences negotiate the contemporary media-saturated environment.

Learning the Ropes

But scholars need to be meticulously trained to conduct good audience research, as the potential pitfalls are many, and the validity of the findings rests on the rigor of the researcher's methodological approach – both to data collection and to analysis.

Unfortunately, precious little training in audience research is offered in most graduate programs, in part because most graduate curricula call for only one or two methods classes – usually one “qualitative” and one “quantitative,” if the student is lucky (if not, the two are rolled into one quick overview that offers a week or two on survey methods and ethnographic fieldwork). But audience research really shouldn't be undertaken on the basis of such flimsy preparation. To conduct thorough, valid, and perceptive research on media audiences, students ideally need to be familiar with the major audience analyses in our field and to have a sound understanding of best practice in their chosen methods.

Training in research methods happens in an environment that tends to pay scant attention to graduate pedagogy; the teaching of graduate students is often left to intuition, mysticism, and serendipity. While manuals and handbooks on the topic of undergraduate college teaching abound, similar attention is seldom paid to the graduate classroom. Graduate students are often expected to absorb knowledge through a process of osmosis. This is a dangerous expectation in preparing students to conduct audience research. For ethnographic fieldwork in particular, the complexities and challenges are so great that adequate preparation is essential if sound evidence is to be collected; a great deal of time could be wasted if students are given short shrift regarding the study of audience cultures.

Teaching a graduate seminar in qualitative methods for the study of communication is a little like herding cats: there are so many issues to deal with, each of which is so complex and buttressed by so much scholarship, that trying to organize everything into a single term's syllabus is literally impossible. But basic topics can be raised, and students' appetites can be whetted for more explorations in ethnography. In teaching these seminars I try to include not only basic texts, but also more sophisticated and engaging ones, like Ruth Behar's *The Vulnerable Observer: Anthropology That Breaks Your Heart* (Behar, 1996) – a reflection that has many resonances for the former journalists in my classes – or Tom Boellstorff's *Coming of Age in Second Life* (Boellstorff, 2008), a book that appeals to the many new media enthusiasts enrolled. Despite the

shortness of a typical semester, I try to send students out of the classroom to conduct at least one quasi-ethnographic study; they return with field notes, recordings, and visual data that we then organize, parse, and interpret through the lens of the relevant theory – probably the most difficult part of any field investigation.

My preliminary exercises involve putting students in groups or pairs; generating a broad research question that is timely and topical (such as: “Are there age-related responses to ambient media in public spaces?”); and sending the teams out to conduct observations and take field notes. Entering the field may be tricky, but, once accomplished, it is usually enjoyable and stimulating. The teams can generate their own research strategies, combining participant observations with in-depth interviews; they bring their notes back to class and work on organizing, analyzing, and interpreting them theoretically. The team approach also allows for engaging issues of triangulations and validity in qualitative inquiry.

Dealing with the mass of field notes, recordings, and other documents accumulated during the course of a study is in fact the true test of the audience researcher. And of course there isn’t just one way of collecting or organizing and interpreting field data. Discussions of the various ways in which one can make sense of qualitative information are a key aspect of any class in methodology. Again, the choices may be intimidating to a newbie – there is no formula to follow, as there would be in a quantitative study, where an ANOVA or a chi-square would present clearly defined steps that yield comfortably empirical results. With field notes – as Wolf (1992) observed – we are dealing with “disorganized thoughts, detailed observations of minutiae, descriptions of rituals, transcripts of conversations, diagrams, and detritus” (p. 128), some of which can be discarded, some of which are treasures, and all of which call for nuanced and varied methods of analysis. In an introductory seminar the most one can do is to indicate the almost limitless approaches that can be used in the analysis of field data. Fortunately most universities offer more specialized classes, which will help students to hone their understanding of how to handle necessarily messy data – messy because, as Wolf (1992) puts it, “[e]xperience is messy [. . .] When human behavior is the data, a tolerance for ambiguity, multiplicity, contradiction, and instability is essential” (p. 129). A broad knowledge of how to interpret and write up field notes can help students negotiate these trials.

I also direct students to classes on ethnography taught in other departments, notably anthropology, but sometimes in other, unexpected disciplinary units as well: at the University of Iowa, the Project on the Rhetoric of Inquiry, an interdisciplinary program, periodically offers a seminar in feminist ethnography, while the English department regularly lists a graduate course focused on ethnographic writing. Eclectic and cross-disciplinary coursework of this kind will enrich a student’s understanding of the multiple facets of immersive audience research.

In addition to classroom instruction, I’d suggest that one doctoral comprehensive exam should focus on theories of the audience, if the student plans to do audience research, because audience analysis has been a key element of our field for more than a quarter of a century now. It’s important for students to know about the core

developments in this area and to recognize the wealth of theoretical and methodological approaches that are possible, as they put together their research plans. From David Morley's *The Nationwide Audience* (1980) to Janice Radway's *Reading the Romance* (1984) to Radhika Parameswaran's articles on feminist media ethnography in India (1999, 2001, 2002), from Elihu Katz and colleagues' (1974) work on uses and gratifications to John Fiske's ideas of the active audience (1989, 1993) and to Bella Mody's thoughts on audiences in developing countries (2010), there's a treasure trove of scholarly literature on the subject that illuminates the almost limitless possibilities of media audience research. The media audience scholar should read outside the field, too, as insights from anthropology, sociology, and ethnic studies are vital to this research area.

From this literature, young scholars will learn that it's possible to conduct audience research in virtually any imaginable setting; the choice rests – first – with the researcher's driving questions, and depends – second – on the feasibility of the study.

Fieldwork is, of course, impossible without access to the field. I referred earlier to the feasibility factor, which must be considered carefully as one embarks on a plan of research. In the following section I'll outline some of the considerations that need to be assessed at the outset of any qualitative or quasi-ethnographic audience study.

Risk and Power

One of my doctoral students was eager to investigate the uses of media among undocumented Chinese women working “under the table” in restaurants, laundries, and other businesses. She had had some experience of these situations and knew that, because many of these women were illiterate in English, media in their native language were lifelines for them, shoring up their sense of identity and offering them reassurance and familiarity. She wanted to conduct a participant observation in a restaurant or sewing sweatshop, taking a job there herself and studying the day-to-day media usage of the workers.

It sounded like a great plan; but, the more we thought about it, the more we realized that it couldn't work. The potential harms to the study participants – an important consideration for any university's human subjects board – would be great, and the women themselves would be acutely aware of this. Most of all, they would fear that their “illegal” status would somehow be revealed to the authorities, which could result in job loss or, in the worst-case scenario, in deportation. As an ethical matter of informed consent, my student would have to tell them of her goal of writing their stories into a dissertation, which would raise red flags with them immediately.

We considered asking the university's institutional review board (IRB) for a waiver of informed consent; but, if we got it, the ethical implications of the work would become even more complex. My student, a Chinese woman herself, was privileged by comparison with the women she'd be studying: she was in the United States legally, on a student visa, getting her graduate degree, and on the way to an upper-middle-class

career as a university professor. She was *safe* by comparison with her proposed subjects, whose lives were in constant peril and who were working in grim, grinding, and impoverished conditions. Deceiving them about who she was in order to gather data for her research seemed like a breach of faith that just wasn't justified.

Ethical considerations like these are at the core of audience research, and they go far beyond the matter of "risk to subjects," which review boards are concerned about. The most potent ethical issues rest on the paired concepts of risk and power. One of my graduate students noted sagely that researchers are inclined to "study down" – that is, to investigate populations of lower social status than the researchers. Hence we tend to have many audience studies of housewives, children, college students, and working journalists. By comparison, we don't tend to see studies of politicians, business executives, doctors, lawyers, or university administrators: these groups are adept at building walls around them that effectively bar graduate students, or even university professors, from gaining access to their elite worlds. It's rare and difficult for us to "study up."

Because we "study down," the power differentials between the researcher and the researched are of pivotal importance. Oakley (1981) suggests that a nonhierarchical relationship between researcher and researched is an optimum condition for gathering information, and the feminist sociologist Dorothy Smith famously noted that researchers participate in "relations of ruling":

There are and must be different experiences of the world and different bases of experience. We must not do away with them by taking advantage of our privileged speaking to construct a sociological version which we then impose upon them as their reality. We may not rewrite the other's world or impose upon it a conceptual framework which extracts from it what fits with ours [. . .] Their reality, their varieties of experience, must be an unconditional datum. (Smith, 1990, p. 25)

The temptation to "study down" may be a well-intentioned effort to represent under-represented perspectives or give voice to socially ostracized or silenced populations – to "speak for others," in the now-classic formulation of Linda Alcoff (1991/2). But, of course, in speaking for less privileged others, the researcher is taking the words out of their mouths – a power move that prevents the subaltern from speaking (Spivak, 1988). Still, there is potential merit to the corollary idea of *speaking on behalf of others* – a progressive project that introduces the element of activism to scholarship. Because of these complexities, the motivations and ramifications of "studying down" need to be explicitly considered as part of the study's theory and methodology.

Study participants may be intimidated by the status and background of the researcher, which may constrain their behaviors and their responses to questions. The research setting is inevitably altered by the presence of a researcher, especially in an ethnographic study, so questions of validity become paramount and their answers can hinge on the relationship between the researcher and the study partici-

pants. Long-term immersion in the field setting is one answer to this dilemma: true participant observation can only be effectively accomplished if the researcher becomes deeply familiar with the setting and the subjects, without losing her/his observational acuity. An intimate knowledge of the field “is also a source of knowledge that makes possible a transformation of what we know, specifically of the anthropologist’s own self-understandings” (Borneman & Hammoudi, 2009, p. 14). It’s crucial for fledgling researchers to be aware of the delicate balance to be struck in field settings before plunging into a research project.

There is also the question of “activist ethnography,” the well-intentioned efforts to effect progressive social change through research; these can be successful, but they can also backfire, causing more grief than good. For decades, ethnographers have been aware of the ways in which social research has served colonizing, imperialist, and racist agendas. The feminist and postmodern critiques of these problems countered these trends by generating ethnographic experimentations with collaborative, dialogic, and activist forms of participant observation. Oftentimes now, the subjects or participants in a study are seen as “epistemic partners” and the research is perceived as providing “collaborative resources for common objects and questions” (Marcus, 2007, p. 9). Activist ethnography can be a powerful societal force, and there are growing movements to support applied research of this kind. In her presidential address to the Council on Anthropology and Education, Catherine Emihovich exhorted students and faculty to engage in action-oriented research: “[W]e must find a way to harness all the wisdom and knowledge we have collected over the years to engage in action at all levels” (2005, p. 306). Examples of successful activist ethnographic projects abound, from working with grassroots community organizing groups in order to challenge unemployment, housing affordability, and local segregation (Lyon-Callo & Hyatt, 2007) to fostering indigenous peoples’ resistance movements (Hale, 2006). Yet, as Hale (2006) cautions, activist researchers are often “partly implicated in the very systems of oppression they set out to oppose” (p. 98) or, worse, they can impose outsider views and disrupt local situations in ways that actually harm the communities being studied. Funding sources and institutional affiliations can also affect the slant and focus of the research. If activist projects are undertaken, the researcher must be certain that they are carried out in close coalition with the members of the community and that they support the expressed goals and needs of the local people. Yet such involvement will, of course, have implications for the entire project: as Fine (1993) has noted, “participant observation often becomes participant intervention: finding a problem, we wish to fix it” (p. 287) – and these motivations shade the way in which data are gathered, findings are reported, and studies are written up. It is critical for audience researchers to be acutely aware of this problematic and to foreground it in their research designs.

My student Yu Shi did end up studying working-class Chinese women, but they were not undocumented laborers, and they were fully informed of her research goals. As she pointed out in her dissertation:

establishing and developing [a] rapport with the participants was a complicated task. I had both advantages and disadvantages. On the one hand, like the participants, I am an ethnic minority and a woman, which allowed me to establish a good relationship with them at the very beginning of the fieldwork. As the participants indicated, they respected me for my education and treated me as an ethnic insider. [. . .] Our middle-class versus working-class differences didn't really undercut our friendly relations, because they identified with me in the sense that I was a poor student living on a graduate assistantship, which is often less than their annual incomes, although at the same time they thought of me as a well-educated person heading toward the American mainstream and having a promising future.

Yet, on the other hand, as some of the women indicated, in their minds I was also a young student, coming from another state, staying for a short period of time, and having little in common with them. (Shi, 2005, p. 39)

Negotiating these intricacies as part of her relationship with her research subjects was one challenge of her dissertation work; her awareness of the need to explicate these issues added strength and rigor to her data collection and analysis. Thus reflexivity is a crucial aspect of audience work: the researcher's identity location vis-à-vis that of the participants, the researcher's goals and motivations for undertaking the research, the researcher's perspectives on the participant population, all impact the value of the project.

Different populations call for different recognitions of power and risk. Working with children exacerbates the power hierarchies at play, and class differences further complicate the mix. In my own fieldwork with schoolgirls (Durham, 1999, 2001, 2004). I found that middle- and upper-class children were open to my research, indifferent to my recording and note-taking equipment, and unconcerned about my presence in their environment, whereas impoverished children were guarded and wary, reluctant to be recorded, and confrontational about my goals. The differences stemmed from their varying experiences with adults: lower-income children had learned to view adults as punitive, authoritarian, and generally critical presences in their lives, so these girls were justifiably more suspicious of my interest than their middle-class peers.

Several of my graduate students have undertaken audience research with children, and they have grappled with these complexities as part of their methodological strategizing. For Shayla Thiel, ensuring that the girls she was studying did not feel coerced into disclosing private information was of vital importance. She was studying girls' uses of instant messaging, and the data she used were submitted voluntarily by her subjects.

I asked them to send me only the conversations with which they were comfortable and allowed them to do so over an extended, flexible period of time. As a researcher, I understand this practice might bring up questions of "validity." [. . .] In order to maintain validity, I asked them to send me "all kinds" of conversations, but in the philosophy of feminist scholarship, I left the instructions ambiguous so that the girls would not feel forced into sharing intimate details of their lives that made them uncomfortable or powerless in the process of the study. (Thiel, 2004, p. 40)

Thiel dealt with validity through the use of multimethodological triangulation.

None of these issues could have been successfully handled if the researchers had not had a keen understanding of their research subjects, as well as a great deal of self-awareness regarding the relational dynamics at work between themselves and their subjects. Before a researcher sets up a method for conducting audience research, he or she must learn as much as possible about the intended study population. Robust audience research cannot be undertaken blindly: knowing as much as possible before entering the subjects' "space" allows the researcher to develop an appropriate method as well as suitably nuanced and sophisticated research questions. I recently heard a research presentation in which the researcher had made certain assumptions about an ethnic minority group's reactions to health messages. The researcher had no empirical ground for making these assumptions: they were based solely on stereotype, and therefore they jeopardized the entire research enterprise. The questions being asked, the method that had been developed, and the theorization framing the study were all irrelevant in light of the fact that the underlying assumptions were unproven and untrustworthy.

One of the three decrees carved on Apollo's sanctuary at Delphi in ancient Greece was "Know thyself." My advice to future audience researchers is: "Know thyself and thy subjects before starting a study."

Mentoring the Fledgling Researcher

As detailed above, the exigencies of audience research in the field call for close and attentive relationships between graduate advisors and their students. When students are conducting audience work, situations arise that are unlikely to crop up in text analysis – or even in experimental settings, where conditions are more closely controlled. In fieldwork, students run into all manner of ethical and personal dilemmas: they may become emotionally attached to their study participants; they may discover illegal activity and be uncertain as to how to deal with it; they may be asked to engage in unethical behaviors in order to gain access to a social setting or gather information; they may run up against uncooperative or hostile people; they may be threatened or physically harmed. It is incumbent upon the faculty mentor to maintain close contact with his/her students while they're in the field, in order to advise, guide, and protect them from harm while the study is underway. Field situations are dynamic and unpredictable, and circumstances change almost daily. Inexperienced field researchers may not know how to handle the problems that present themselves in the field, so mentors must be available for consultation at any point.

Helpful mentoring is born of experience: the best mentors for fieldworkers are those who have ventured into the field themselves and have dealt at first hand with the provocations and challenges of audience research. Because of this, mentors can't afford to be reticent about sharing with students their own work – and their own

dilemmas, problems, even failures; these “tales of the field” are part of the learning experience. I, as well as other faculty members who teach classes on audience research and supervise graduate students conducting it, sometimes assign our own articles in classes, and we do it with the goal of discussing the predicaments and aggravations we encountered in our own forays into the field and of encouraging students to ask probing questions and to interrogate the ethics, politics, and problematics of our methodologies. For example, during my own fieldwork with adolescent girls on issues of gender and sexuality, I promised these girls confidentiality, but I also determined, privately, that, if I came across a child in an abusive situation, I would break my promise and report it. And in fact I did learn that one of my study participants had been sexually abused by a family member; fortunately the school social worker had already alerted the authorities and the situation was being handled by Child Protective Services. Jennifer Hasty (2010) reflects on the notion of positionality in the pursuit of fieldwork, exploring the ways in which “responsible complicity” with the community one is studying can sometimes draw researchers into participating in possibly unethical or even illegal activities. As a young ethnographer conducting media anthropology at a newspaper in Ghana, she was asked to lie in order to get a story: she dodged the situation. Other fieldworkers have had to make difficult decisions about participating in illegal activities such as drug use or dealing, or about concealing such activities from the authorities. These are just a few examples of the predicaments of positionality in fieldwork, but the need for alert and expert mentoring is underscored through the recognition that contingencies of all sorts can intervene in the best designed field observations.

Space and Place

When we’re studying media audiences, we generally want to know how they’re using the media: their choices of media, their engagements with them, their negotiations of media messages, and their production of media. These research aims call for making choices about the setting in which it’s best to learn about these processes. There are, of course, a wide variety of physical – and, increasingly, virtual – locations in which to study media audiences; all require the researcher to decide on a space in which the study will be conducted and then to “cross a border” into that space.

Sometimes these spaces are classrooms, or specially equipped university research facilities outfitted with wide-screen monitors, recording equipment, and one-way mirrors for observation. Experiments, focus groups, and sometimes questionnaires or surveys are administered in such settings. At other times, surveys are conducted via telephone, email, or the Web; then the “space” of the study is auditory or virtual. Sometimes the researcher attempts to study the audience in a more “natural” environment and enters a home, a school, a club, a dormitory, or some other setting in order to try to observe the audience in its characteristic habitat, so to speak.

In all cases, the choice of “space” has its drawbacks as well as its strengths. A space that the researcher has designated and prepared for a study has the “benefit” of being thoroughly artificial; that is, as Webster and Sell (2007) point out, “[a]rtificiality means that a well-designed experiment can incorporate all the theoretically presumed causes of certain phenomena while eliminating or minimizing factors that have not been theoretically identified as causal” (p. 34). In artificially contrived research settings, the researcher doesn’t have to consider the impact of environmental factors on the data: the data can be considered in isolation from all other factors. Research facilities in fact do facilitate research: they make data collection easier and more manageable. They are geared to the researcher’s convenience.

Paradoxically, this very artificiality can be a significant drawback in media audience research, where audience members tend to interact with the media in an eclectic assortment of settings, while they are beleaguered by distractions of every sort or comfortably ensconced in some private and familiar space – perhaps in a bedroom or basement – or among friends, in a bar or cafeteria. Such settings reflect more accurately the ways in which the media are part of an overall social space or living environment, allowing researchers to track the ways in which media use happens in everyday life. Given these realities, the data gathered in focus group facilities, laboratories, or classrooms may not be generalizable, because they have little bearing on real-world media use. Moreover, study participants may feel uncomfortable or intimidated by such settings, and their responses to the media may be affected accordingly. Power is, once more, a factor in selecting the location of an audience study.

On the other hand, the “messier” real-world research spaces pose problems, too. The researcher’s presence is the first: the researcher is the stranger element in the field setting and must work to find a place in it. He/she has to establish a rapport with the study participants, ensuring that they are fully informed and have consented to the study. Becoming familiar with the research environment could take weeks or months; while initial observations can and should be recorded, patterns as well as anomalies can only be discerned after longer-term immersion in the field setting.

Fieldwork complicates data collection. Field researchers must decide whether to use obtrusive recording equipment – which, again, may discomfit the study participants – or whether to try to find more subtle methods of collecting data, perhaps by reconstructing a situation shortly after its occurrence, but not in the presence of the study participants. Crang and Cook (1995) describe researchers running to the bathroom to write up their field notes, a condition jokingly known as “ethnographer’s bladder.” In the field, ambient noise can muffle tape recordings, coffee can get spilt on notebooks, cameras batteries can run out. There are definite challenges to doing field research; but as Borneman and Hammoudi (2009) assert, “the agony of fieldwork [is] integral to knowledge production” (p. 260). Being there matters.

A note needs to be made here about entering audiences’ physical environments. In this online era, it’s tempting to believe that text and audience merge: that words on a screen are equivalent to the person who generated them. And indeed, online ethnographies can, and have, been conducted – though the notion is still controversial

and must be approached with rigor, caution, and a thorough understanding of the implications. As Hine (2006) points out: "Online social formations seem to challenge existing ways of conceptualizing research sites and ask for new strategies of exploration" (p. 10). Can online social environments be conflated with offline ones? How does one verify the identity of an online informant? What are the concerns with validity and reliability in online research?

In Jay Clarkson's (2006) dissertation research on the production of masculinity in an online gay community, these questions were asked in order to formulate a method that would yield valid data and findings. In his decision to study the online community so as to gain "a better understanding of these men's cultural practices and the institutional and ideological factors that influence them," Clarkson argued for "the unique characteristics of the Internet as a research space" (p. 53). "The men use this space and the discussion of media stereotypes as an identity expressive function," he notes (p. 48). In addition, he decided to observe the site as a so-called "lurker" – but not as a participant, since his participation had the potential to disrupt the site's authentic dynamics.

Yet Clarkson's defense of online-only ethnographies has been challenged and debated in more recent years, as the popularity and scope of analyzing online interactions has dramatically increased. Lindlof and Shatzer (1998) point out the potential perils of misinterpretation or miscommunication in online interactions, which could arise from lack of nonverbal cues and other ambient information. Yet Marwick and boyd (2010), in a study of Twitter users, focused only on the online context, arguing that the online arena constitutes a "networked community" that can be studied on its own.

Thus a crucial question vexing ethnographers today is that of the validity of online research as authentic fieldwork. Is "being there" online the same as "being there" in person? How trustworthy, verifiable, and useful are online spaces as research sites? How can one verify the claims made in the virtual world? In Lee Farquhar's dissertation on identity negotiation on Facebook, the pros and cons of online research were carefully weighed; Farquhar concluded: "The value of online interactions is bolstered when coupled with offline interactions. They become informative both in terms of understanding the individual through their discussion of other content and through differences (if any) in their performances in each setting" (Farquhar, 2009, p. 53). Farquhar coupled online participant observation with offline "F2F" interviews with his subjects, a methodological decision supported by much of the relevant scholarship in this area.

"Emerging online spaces of the Internet [. . .] belong to an entirely new category of space," notes Burrell. She argues that cyber-ethnography must be understood as a process in which the researcher "physically inhabits only certain parts of the space" (Burrell, 2009, p. 187). The field site must be thought of as a network that includes online and offline locations and their intersections. Triangulation, multi-sited approaches, and verification become more central to fieldwork involving online communities and virtual identities. "Use of the Internet frequently involves an engagement

with the imagination and the production of imagined spaces because there is much that this medium conceals,” she writes; but “imagined spaces constituted an important source of meaning that could be related to the experiences and activities of Internet users on a nonimaginary plane of existence” (pp. 193 and 194). Both the imaginary and the nonimaginary are crucial to virtual ethnography: one cannot be privileged over the other. Validity is tied to constructing the field site as one that closely tracks the phenomenon under investigation.

In this vein, media audience research in an Internet age calls for new methodological and theoretical questions to be asked. As the Internet and related technologies evolve, online media audiences cannot be conceptualized in traditional ways, as they often are both producers and receivers of media; they are simultaneously occupying multiple roles and locations in the media matrix; and in a rapid-fire, interactive, dynamic media environment new approaches and understandings of “audience” are called for. Media studies is a field that is bombarded by minute-to-minute changes – in technologies, in audiences, in social configurations, in economic structures, in identity politics. The virtual is melding with the “real” and the hyperreal in unforeseen ways. There is a growing literature in this area, and students opting to conduct online audience research must be well versed in the methods, theorizations, and debates that surround and support such work.

Tackling Audience Research: Closing Thoughts

All of these developments in media audience research engage two key questions: What is a media audience – and why conduct audience research? Neither has an easy answer any more. The first calls for new definitions, new conceptualizations, and new research approaches in an era of post-postmodern fragmentation and constant technological flux.

The second calls for philosophical reflexivity and for a sense of how one’s work might contribute, not just to the field of media research, but to our knowledge of the world. As Ang (2000) pointedly demands: “Why are we so interested in knowing about audiences in the first place?” (p. 487). To what end are we invading people’s spaces, interrogating their practices, analyzing the texts and images they create? From a critical/cultural studies perspective, there is always a degree of exploitation in such an enterprise. Traditional audience research has always had a commercial or political aim; more critically oriented studies have addressed the nature of media, their role in subjectivity, their motivating mechanisms. The training of future scholars must guide them to think carefully about why they might want to engage in audience research, what their relationship with those audiences should be, and what the ultimate good of such research will be.

In the end, the research questions the student is asking will drive the method of data collection; ethnography and related qualitative approaches are best suited to

research questions that seek to uncover the subsurface complexities of people's engagements with media in their everyday lives. As Gillespie observed:

Ethnography highlights the small-scale processes, rather than the large-scale products, of people's perceptions, thoughts, and action. The ethnographer reads the world, as she reads mediated messages, through the eyes of her informants themselves; she focuses on the microprocesses of daily uses, interpretations, and identifications. (Gillespie, 1995. p. 1)

No other methodological investment can offer the depth, texture, intricacy, and verisimilitude of long-term fieldwork. When research seeks to penetrate into the complex workings of the media in the gloriously heterogeneous and diverse "real world," then the researcher must arm himself or herself with a field diary, recording equipment, informed consent forms, and an intrepid attitude, and venture, like an explorer, into the media wilderness, where a multitude of joys and discoveries about media audiences await. In the end, it is the academy's responsibility to teach and mentor future media scholars to find their way in the wilderness of audience research.

Fostering Surprise and Productive Discomfort in Audience Studies through Multi-Sited Ethnography

Kim Trager-Bohley

ABSTRACT

Can an increased engagement with multi-sited ethnography invigorate audience studies? Yes. Too often, media and audience studies scholars have tended to hamstring ethnographic methods by predetermining their audiences, their activities, their research sites, and the temporal sequence of their research. This chapter argues that multi-sited ethnography has the potential to enlarge the boundaries that have circumscribed and enclosed media/audience studies if researchers can avail themselves of its central strengths – its unpredictability and flexibility. I urge audience studies scholars to embrace a flexible research imaginary that can be open to surprise, modification, and productive discomfort while tracking mobile social formations that crisscross multiple and unexpected sites and local–global dichotomies. Drawing on my fieldwork on global sponsors of literacy in the United States and Singapore, this chapter discusses several overlapping elements of multi-sited ethnographies: (1) its tracking strategies; (2) its emphasis on complicitous relationships; (3) its greater exposure to multiple perspectives, including multi-level power dynamics; and (4) its unbounded, open-ended notions of the field, which are not limited or constrained by place.

Today an increasing number of third-generation audience scholars have experimented with multi-sited ethnography in order to demystify and “ground” everyday life in a mediatized, globalized world. This impulse is particularly strong among those who are interested in new media such as mobile phones, blogs, and podcasts (Bakardjieva, 2005; Hartmann, 2006; Karl, 2009). Many of these researchers have already pushed the boundaries of ethnography beyond the field’s early theoretical formulations of this approach (see Radway, 1988), for example by defining fieldsites conceptually rather than spatially. Interestingly, though, with a few notable exceptions (Green, 1999; Lotz & Ross, 2004), there has been relatively little shop talk collectively among these scholars about the pragmatics, ethics, and implications of multi-sited ethnography. Surprisingly, some keystone contemporary overviews in audience studies only devote a couple pages to this methodology (see Bird, 2003).

What, if anything, does multi-sited ethnography offer media and audience studies? The present chapter explores this question. Ultimately, I argue that multi-sited ethnography has the potential to generate greater insights into new modes of translocal social experiences and everyday life in a mediatized, globalized world than a single-sited audience/media study or a political economy-based analysis. Moreover, I contend that the insights garnered from the former approach are more likely to reveal the fluid and multilayered complexities of power dynamics and social relationships than the latter modes. Finally, I suggest that multi-sited ethnography is a particularly effective approach to discover the intertextual links and disjunctures among various intersecting, though not always apparent, discourses and sites where we can witness the fabrication of the taken for granted concept of culture.

In my experience, multi-sited ethnography has offered an important methodological tool to examine the continuity and disruption between competing ideologies, practices, and discourses of reading, in an age in which global capitalism is increasingly structuring and intersecting with consumers’ media experiences. Drawing on the ethnographic and theoretical problems I encountered during my fieldwork on global sponsors of literacy in the United States and Singapore, I suggest that there are several dimensions of multi-sited ethnography that have the potential to invigorate tired narratives of audience studies and to disrupt limited notions of reception, of audience activity, and of the global–local nexus.

Though multi-sited ethnographies have informed and inspired the “research imaginary” of media scholars – for example, Nick Couldry’s (2003) conceptualization of “passing ethnography” (pp. 49–52) and Patrick Murphy and Marwan Kraidy’s (2003) understanding of “translocal ethnography” (pp. 304–305) – in most cases multi-sited media ethnography has been carried out by cultural anthropologists. Here are three examples in cultural anthropology: Abu-Lughod’s (1997, 2005) studies, which track a television serial as it circulates from Cairo to Upper Egypt, Hannerz’ (2003, 2004) studies, which investigate the practices of foreign news correspondents in Jerusalem, Tokyo, and Cape Town; and Rotenberg’s (2005) study, which explores the transnational connections between podcasters, producers, listeners, and advertisers.

These studies deploy ethnographic observations from fieldwork to illuminate contemporary modes of translocal social experiences. They also provide important insights into the ways in which the micro-practices of everyday life, including media rituals and media consumption, are tied to larger, macro-forces of global capitalism. Most notably for the purposes of this chapter, these authors reflect about the ethical and methodological issues that typically mark this genre of research. Unfortunately, in most audience/media studies that have attempted this kind of multi-sited approach, such reflexivity is absent or tenuous. All too often the phrase “multi-sited ethnography” is just dropped into the methodological section of a media studies article, without much explanation or discussion.

While anthropologists of various stripes have been grappling with the benefits and pitfalls of multi-sitedness for years (Coleman & von Hellermann, 2009; Falzon, 2009), media scholars have been slower to engage in a sustained dialogue about the rationale, proposed objectives, and political/ethical stakes of this approach. Moreover, when one flips through current and past issues of the *Communication and Critical/Cultural Studies*, the *Global Media Journal*, the *Journal of Communication Inquiry*, and other journals, only a few studies explicitly position themselves as multi-sited ethnographies. Even global media studies are marked by “a paucity” of works that directly embody or discuss this approach, as Kraidy and Murphy (2008) lament (p. 346). Clearly a large number of media ethnographies still remain single-sited, at least geographically (Baisnée & Marchetti, 2006; Hasty, 2006).

Intriguingly, several researchers who have conducted multi-sited or multi-sited(esque) media ethnographies have deliberately chosen alternative names to label their work. For example, Georgiou (2006) injects the phrase “multi-positioned ethnography” to describe her study, which draws on fieldwork research carried out in London and New York and designed to explore mediatized spaces and diasporic cultures among the Greek Cypriots (p. 35). And, though Terhi Rantanen (2005) draws on George Marcus’ understanding of multi-sited ethnography and asserts that “multi-sitedness” is a key term in her study, she prefers to use the phrase “global mediagraphy” rather than “multi-sited ethnography” to define the methodological approach in the book *The Media and Globalization*, which uses ethnographic methods such as oral history to examine how “four generations of three families” dispersed across five countries “connect or disconnect via media communications” (p. 14).

Perhaps some scholars who study the media and its audiences are reticent about defining parts of their work as “multi-sited ethnographies” because of the stern, albeit necessary and productive, critiques that were levied at the pioneers of media ethnography: they were attacked for producing only “quasi-ethnographic” studies, which did not live up to the anthropological ideal (Abu-Lughod, 1997; Ang, 1996; Bird, 1992; Murphy & Kraidy, 2003; Nugent & Shore, 1997; Ortner, 1995). The ongoing criticism waged at contemporary multi-sited projects within cultural anthropology may also give some media scholars pause (Candea, 2007; Coleman & von Hellermann, 2009; Hage, 2005). On top of this, reports of cultural anthropologists researching more than eight geographically dispersed fieldsites in one study (Falzon,

2009, p. 17) and assertions made by Peterson (2003, p. 269) and others that, “to be done properly, multi-sited ethnography may well require a team of ethnographers” are no doubt overwhelming – say, for a media studies doctoral student, who in all likelihood has only taken one or two courses in ethnographic fieldwork and none specifically geared toward multi-sited ethnography, as this remains an undertaught research method in communication and media graduate programs.

Of course, these are just speculations. One certainty, though, is that, at this point in time, the role and place of multi-sited ethnographies in media studies in general and in audience studies specifically seems unclear. This position of multi-sited ethnography is all the more puzzling given the fact that, in his highly influential article on multi-sited ethnography, cultural anthropologist George Marcus (1995) asserted that media studies was “one important arena” in which this approach was emerging. What happened? And how might an increased engagement with multi-sited ethnographies revitalize the field?

In this chapter I argue that multi-sited ethnography has the potential to break down the circumscribed boundaries that have enclosed media/audience studies, if researchers avail themselves of its central strengths – its emphasis on unpredictable outcomes of fieldwork and on flexibility. Too often, media/audience study scholars have tended to hamstring ethnographic methods by making *a priori* assumptions about the audiences the audiences, their activities, the research sites, and the temporal sequence of the research (Amit, 2000, p. 17). In doing this, researchers do not leave themselves open to discovering the unexpected connections and disjunctions that are supposed to unfold during a project (Marcus, 1995). Consequently their fieldwork experiences and subsequent accounts contain a lot of recycled themes and few surprises.

I contend that “being surprised” is an important component of intellectual inquiry, especially in ethnography, even though it has received little attention in cultural studies and media studies, as noted by Murphy (1999, p. 208). When entering the field, media researchers need to embrace a flexible research imaginary that is open to surprise, modification, and the productive discomfort that comes with the unknown. Fortunately, several overlapping elements embedded in the multi-sited ethnographic approach encourage this orientation: (1) its tracking strategies; (2) its emphasis on complicitous relationships; (3) its greater exposure to multiple perspectives, including multi-level power dynamics; and (4) its unbounded, open-ended notions of the field, which are not limited or constrained by place.

It is important to note that one particular aspect of multi-sited ethnography prematurely closes, or at least limits, research possibilities and surprises: its conceptualization of the object of inquiry. I discuss this limitation in the next section. Here I also give a brief overview of the origin and development of multi-sited ethnography, especially as it pertains to media and audience studies. Then I provide a description of my multi-sited approach to global sponsors of literacy. The remainder of the article ethnographically contextualizes the four aforementioned dimensions of multi-sited ethnography and discusses their potential to reinvigorate theory construction and methodological innovation in audience/media studies.

Multi-Sited Ethnography: Possibilities, Problems, and Pleas

As a concept, multi-sited ethnography made its official *début* on the academic radar in 1995, with the publication of George Marcus' "Ethnography in/of the World System: The Emergence of Multi-Sited Ethnography." This is not to say that anthropologists and others weren't previously practicing this sort of method. They were, of course, as Marcus carefully details (pp. 102–105). But, prior to his article, multi-sited ethnography lacked a unifying name, a documented history, and an articulated vision. Marcus gave this approach a voice and brought seemingly disparate areas of study under one methodological roof. During the past 15 years, Marcus' conception of multi-sited ethnography has been critiqued, modified, and "refunctioned" by researchers across the social sciences who have adopted multi-sited approaches to explore the ways in which world systems such as globalization, capitalism, migration, postcolonialism, and transport technology impact local and transnational networks, flows, and movements (Holmes & Marcus, 2004, 2005).

Marcus' (1995) "reformative thesis," as Falzon (2009) calls it, can be read as an attempt to elevate ethnography's place in an increasingly globalized world and as an intervention into debates that questioned whether this approach could keep pace with the complex systems, processes, and realities that characterize a postmodern society (Comaroff & Comaroff, 1992; Gupta & Ferguson, 1997; Marcus, 1995, p. 97). Marcus defined the object of inquiry in multi-sited ethnography as the circulation of particular social formations – such as objects, identities, and cultural meanings – embedded in interlocking world systems, in diffuse time-space (p. 96).

One significant point to stress here is that Marcus initiated a shift in the focus of fieldwork, from set places and subjects to the movement of complex social formations that cannot be investigated from a single fieldsite (Hartman, 2006, p. 280; Marcus, 1998). This has obvious implications for the audience study scholar, because, as she examines a particular formation that moves along and through circuits and paths, her inquiry will inevitably be pushed beyond "an audience," "the text," and "reception" due to the fact that a social formation on the move (be it a television show, a communication practice, or a media corporation) will invariably intersect with multiple social actors (producers, cultural critics, editors, distributors, and so on) and cultural/communicative contexts (production, distribution, public reception, home viewing, cultural performances, and impersonations).

For Marcus, "the very heart" of the multi-sited mode is "following connections, associations and putative relationships" among and through multiple sites that cross-cut dichotomies such as the "local" and the "global," the "lifeworld" and the "system" (Marcus, 1995, p. 97). Therefore he advocated that researchers adopt tracking strategies that would enable this sort of intellectual discovery. More specifically, he urged scholars to literally follow the objects of their study, for example "the people," "the

thing,” “the metaphor,” “the conflict,” “the biography,” and “the plot, story or allegory.” Researchers have added to Marcus’ original list since its inception. Strauss (2000), for example, decided to “follow the practice” in her transnational study of yoga. And Green (1999) attempted to follow multiple paths within her single study of virtual reality technologies. Today certain tracking strategies have been identified as particularly apt for specific fields. For example, Boyer and Hannerz (2006) encourage ethnographers of journalism to “follow the story.”

Researchers of education, migration, sociology, religion, and other fields have viewed Marcus’ conceptualization of multi-sited ethnography as groundbreaking because it pushed ethnographic research beyond the classical anthropological notions of a single, bounded fieldsite (often represented as Malinowskian ethnography), and it broadened and diversified the scope of topics deemed worthy of ethnographic inquiry. As noted earlier, though, a number of reservations have been expressed about multi-sited ethnography. From the beginning, some scholars have challenged Marcus’ depiction of the “boundedness” of early fieldwork and fieldsites (Falzon, 2005; Hendry, 2003, p. 499; Strathern, 2004). Other scholars have suggested that, in purporting to study the “world system,” multi-sited ethnography embodies the very tacit holism it was trying to critique and escape (Candea, 2007; Hage, 2005).

One of the most frequent criticisms waged against multi-sited ethnography is that it compromises the researcher’s ability to capture local texture, depth, and breadth (Burawoy, 2003; Hage, 2005). This charge is of particular interest to, and concern for, audience and media scholars, who have for years bemoaned the contextually challenged ethnographies that too often characterize their craft (Ang, 1996; Darling-Wolf, 2003). Probably for this reason, Abu-Lughod (1997), Kraidy and Murphy (2008) as well as others insist that a multi-sited ethnographic approach to audience and media studies must work in tandem with a Geertzian “thick description,” which is based on rich contextual interpretation (Geertz, 1973). Though Kraidy and Murphy seem to concede that Geertzian thick description has some limitations (e.g., its peripheral placement of power issues), and though Abu-Lughod suggests that it may need to undergo “some creative stretching to fit mass-mediated lives,” none of these researchers explains what sort of modifications thick description needs when extended to multi-sited ethnography (Abu-Lughod, 1997, p. 110). In such applications, do our conceptualizations and practices of thick description need to be modified? I think so.

A multi-sited ethnography in which the ethnographer geographically and conceptually follows a mobile object of inquiry through systems, chains, or paths is going to require a type of thick description that looks and feels different from the thick description that is traditionally associated with interpretative ethnography. This is because the latter approach is directed by different goals and assumptions from those of the former. Traditionally, for example, one assumption of thick description is that, to interpret and understand a particular culture, an ethnographer must fully immerse herself within it (Geertz, 1973, p. 4). Yet, as noted by Horst (2009, p. 126), “the purpose of multi-sited fieldwork is not a ‘full,’ located understanding of ‘culture,’ but rather one which targets transnational networks and flows.” For Horst (2009),

Wittel (2000, p. 5), and others, depth and breadth in a multi-sited ethnography is sought through the thick description of a network, not of its individual nodes. Given the practicalities and objectives of multi-sited ethnography, some sites will – and should – be thicker than others.

For the purposes of this chapter, my primary concern with Marcus' formulation of multi-sited ethnography is his preconceived and ultimately reified understanding of the object of inquiry (social formations such as objects, identities, and cultural meanings). Even though he and his colleagues stress the importance of choosing research sites as they unfold in the field, *a posteriori*, and the importance of following the moving objects through their various crisscrossing and unexpected paths (Falzon, 2009), these researchers do not embrace the same open and flexible orientation toward the transformative nature of the objects themselves and their potential conceptual and material offshoots. In my study of global sponsors of literacy, which will be detailed in the next section, my initial object of inquiry changes and multiplies. While I set out initially to follow a “thing” (according to the corporate model), that thing soon became coupled with a “practice” (book browsing) that led to multiple physical and discursive “conflicts” (for example, kiasu browsers). Through my tracking, I also observed the way in which individuals whom I labeled as “audiences” (book browsers) in one site transformed themselves into “producers” (letter writers) in another site.

Drawing on his multi-sited ethnography of Malayali migrants in Rome and Ernakulam, Gallo (2009) considers the transformative nature of multi-sited objects of inquiry and of pleas for a more radical openness to this reality. His reformulation of the relationship between multi-sited ethnography and the object of inquiry is particularly relevant to my insistence on the intellectual importance of surprise. So I quote Gallo (2009) at length:

[M]ulti-sited ethnography implies not only the capacity of being ready to put into question theoretical assumptions and research expectations that precede fieldwork; it also requires the researcher to put into question previous sites of ethnographic inquiry in light of new ones. This paradox is probably best understood if we consider the shift from the more formal understanding of multi-sited ethnography as articulated by Marcus (1995), to a more radical one. In the first stance, this strategy emerges from the objective of following a “known conventional process” – this being a person, object or idea. But, in my experience, through the same process, what was (partially) known became almost “unknown,” as I had to locate my initial interests within a new set of emerging, unexpected relations and research possibilities. This brings us to a more recent elaboration of the concept, in the sense that the multi-sited field emerges from collaboration with which fieldwork begins. (Gallo, 2009, p. 89)

In line with Gallo and others, I urge multi-sited audience scholars to allow their initial object of inquiry, along with their site selection, to unfold and transform through their fieldwork and relationships with informants – or “paraethnographers,” to use a term by Marcus. An inability to recognize or adapt to the transformative modifications of

circulating social formations will result in the same sort of closure that the conceptual foreclosure of fieldsites engenders.

My Project: Multi-Sited? Multilocal? Or Just Multiperspectival?

During graduate school I became interested in the anthropology of reading and textual practices in the context of globalizing capitalism. More specifically, I became fascinated with the ways in which commercial “sponsors of literacy” increasingly structured and intervened in the reading experience. Deborah Brandt (1998) developed the concept sponsors of literacy to refer to any agents – personal or public, elite or nonelite – who “enable, support, teach and model, as well as recruit, regulate, suppress or withhold literacy – and gain advantage by it in some way” (p. 166). I have found her work extremely useful in considering how individual textual practices are tied to larger socioeconomic structures. Brandt’s work prompted me to ask: How have the practices and ideologies associated with particular sponsors of literacy impacted mundane textual practices such as reading, book buying, and bookselling? How have ordinary readers and print professionals understood and responded to these powerful cultural institutions?

With the growing popularity and ascendancy of Borders Group, Inc. and Barnes & Noble in the late 1990s, I began thinking about these questions in the context of mega-bookstores. Importantly, Borders and Barnes & Noble are not just companies in the business of selling books and CDs. They are powerful corporate sponsors of literacy that have in recent decades rivaled traditional ones – such as libraries and public schools – in guiding individuals on “what, when, why, and how” to read (Brandt, 2001). The conceptualization of reading that mega-bookstores propagate stands in contrast with the reading experiences institutionalized by traditional sponsors of literacy in the West. These sponsors taught the masses in their home country (Soltow & Stevens, 1981) and abroad (Forbes, 1986; Rooke, 1980) that reading was a serious activity, and they tamed unruly readers by imposing discipline on the body and on the mind. In general public schools, religious Christian publishers, and independent bookstores have traditionally encouraged slow, deliberate reading, reading as a process driven by the goals of spiritual enlightenment, intellectual development, and aesthetic awareness, not by sensory pleasures (Wright, 2005).

In the 1990s US mega-bookstores such as Borders and Barnes & Noble began to promote a conception of “good reading” and “good bookselling” that stood in contrast to the one propagated by traditional sponsors of literacy (Miller, 2006; Mitchell, 2006; Trager, 2005; Wright, 2005). In an effort to increase sales and attract consumers, Barnes & Noble and the Borders Group ushered in a social, sensual model of reading, which distanced itself from the didactic functions incorporated by the model of traditional sponsors of literacy. By the late 1990s Borders began

transporting this model of bookselling and this ideology of reading to the Asia-Pacific region. Borders opened its doors in Singapore on November 1997, during the maelstrom of the Asian financial crisis. With an initial stock of more than 120,000 book and 2,000 magazines, Borders became the source of another maelstrom in the book world. Its “social, sensual” model of bookselling was unequivocally viewed as the format innovator among consumers and print professionals (Trager-Bohley, 2010).

My first endeavor in exploring how social and sensual models of bookselling intervene in everyday reading practices took place in a Borders bookstore located in a Midwestern university town in the United States. There I conducted a single-sited ethnographic study that entailed in-depth interviews, participant observation, and systematic participant observation. After conducting interviews and engaging in participant observation for one year, I decided to systematically document and analyze the café reading that occurred in the store. So I recorded the readers’ activities on a reader profile sheet. The time frame was one week, from nine o’clock in the morning to eleven o’clock in the evening each day.

The reader profile sheet was designed to help me assess reading practices and habits, including reading absorption level. I noted, for example, how many books, magazines, and newspapers readers brought to their table. I documented the types of material they read. I documented how many reading breaks they took. I recorded whether they read alone or with others. And I timed how long for they read. On the basis of these profile sheets and of my other fieldwork, I discovered that a large percentage of these café readers “inhabited,” to use a term by Fuss (1989), many of the contemporary reading practices, including hyper-reading breaks, genre blurring, and manic skimming, that mega-bookstore promote to increase consumption.

Through interviews and participant observation, I discovered that even the self-defined serious readers in the café, who shared a history of being closely affiliated with traditional sponsors of reading (that is, libraries, universities, and literary critics), had adopted many of the above practices. I found their responses to the reading environment constructed by Borders significant because it provided some insight into the socializing potential of mega-bookstores as contemporary sponsors of literacy. In my findings, I argued that Borders had intervened in the way in which these individuals came to understand and practice reading.

Though some of my informants, namely the more serious readers, characterized the reading culture at Borders as undisciplined when comparing it to that of libraries, for example, the environment still seemed pretty orderly, to judge by my Singaporean friend’s account of the “chaotic” scene that marked the Borders bookstore in her home country. Her report encouraged me to read more, among other factors, about some of the controversies, confusion, and questions that accompanied Borders’ transnational expansion in the late 1990s.

Informed by my research in the United States, I became interested in the way in which Borders Group and other transnational booksellers such as the Japanese-based Kinokuniya emerged as global sponsors of literacy in Singapore and elsewhere during

the late twentieth century. At this time, the internationalization of transnational booksellers and of the practices they encouraged had not been the subject of a focused research. To pursue this topic, I knew that my research would have to take a transnational turn. A multi-sited project began to emerge. But where does one begin? At the time when I was designing my study, Borders had more than two dozen international stores in five different countries. The question of how to select the initial fieldsite is a common concern among multi-sited ethnographers, who are often attempting to follow an object that is located geographically or conceptually in multiple sites (Falzon, 2009). Eventually, on the basis of several conceptual and practical factors, I chose to commence my transnational fieldwork in Singapore.

To begin, Borders Singapore was the corporation's first international store, and I thought it would be interesting and revealing to study this business prototype. Second, I thought the cultural context of Borders Singapore would provide a greater contrast with my single-sited study in the United States than the other (mostly Western) international Borders stores would. Though I was pursuing an initial fieldsite that was culturally and politically very different from my former fieldsite, I also sought to do research in a country in which English was spoken by the majority of its citizens. As an initial fieldsite, Borders Singapore met this condition. Finally I was drawn to do research in Singapore because of the country's multicultural diversity and geographical proximity to other international Borders stores. With a limited budget and a one-year time frame, I thought these variables would afford me some flexibility in exploring the multiple and diverse cultural sites that might unfold during my fieldwork. In general, I tried to pick an initial fieldsite that blended multi-sited opportunities with the feasibility concerns of doing a project abroad.

During my year in Singapore (2005–2006), a former British colony that is now an island nation-state in Southeast Asia with a population of more than 4 million, I conducted open-ended interviews with more than 80 individuals associated with Singapore's print culture, including publishers, writers, librarians, booksellers, everyday readers, and government officials. In addition to the in-depth interviews, I conducted five focus groups with individuals associated with various sectors of a print culture (e.g., Malay librarians and Readasia book club members). In Singapore I tried to go to as many book and cultural activities as possible. To triangulate my interviews and participant observation data, I distributed a five-page survey concerning reading and textual practices to 235 undergraduate students enrolled at the National University of Singapore.

While my research in the United States involved "studying sideways" and "studying up" in a single place-based site, my research in Singapore required me to study "up," "down," and "sideways," in virtual and physical space, while considering the complex ways in which "audiences" participate in and/or intersect with a web of social actors (producers, distributors, journalists, and the government) in the production, consumption, and reception of transnational media (Nader, 1972; Hannerz, 1998, 2004). While initially I had only planned to interview print professionals and consumers associated with Singapore's English print cultures, eventually I broadened my informant pool so as to include professionals and consumers associated with Singapore's Chinese, Malay,

and Tamil book sectors. This unexpected expansion of sites was triggered by several field opportunities that opened up through my meeting new informants – who became paraethnographers – associated with these minority print cultures.

I classify my research in Singapore (not just my geographical move to Singapore from the United States) as multi-sited, and not just multilocal, because of the cultural differences that marked each site. As others have noted, a site or field doesn't necessarily have to be a geographical place involving a sojourn to two or more countries (Falzon, 2005; Gallo, 2009). Of this, Mark-Anthony Falzon asserts: "It seems that multi-sitedness actually means not just sites, but spatialized (cultural) differences – it is not important how many and how distant sites are, what matters is that they are different" (2005, p. 13). I would also contend that my project on global sponsors of literacy is best defined as multi-sited rather than multiperspectival, because it goes beyond offering diverse perspectives from one site about a set social formation. It examines various perspectives found in multiple and diverse sites about mobile, transformative social formations.

Drawing on my fieldwork in the United States and Singapore, I will now explore four overlapping elements embedded in multi-sited ethnographies that encourage surprise, productive discomfort, and a flexible research imaginary.

The Diffusion, Modification, and Rejection of Borders' Model of Bookselling

Dimension One: The Unexpected Connections and Disjunctions Discovered Through Tracking

During my first few weeks in Singapore, I spent much of my time observing the reading and social scenes that occurred in the 32,000-square-foot Borders bookstore on Wheelock Place, off Orchard Road, the posh shopping district in Singapore. I took notes throughout the store – in the jungle of the children's section, in the cruising zone by the magazines, and in the *al fresco* Borders Bistro. Given my interest in tracking the internationalization and diffusion of Borders' social, sensual model of reading, I was particularly eager to discover the ways in which the store's layout, clientele, title selection, and social practices were similar to and different from those found in the Borders store that I had previously examined. Early on in my participant observation of Borders, I became aware of one significant difference between its bistro and the Borders café that I had observed in the United States. An excerpt from my fieldnotes offers these observations:

While I was drinking my iced coffee in the Borders Bistro, I noticed that more people were drinking Tiger Beer than sipping cappuccinos or tea. It was a Friday night at 5 p.m.; the scene was lively and loud. There was little serious reading going on. In fact,

there wasn't one bookworm poring through a stack of books. I didn't see any tables loaded down with a pile of magazines or books. What a contrast to the "study hall atmosphere" that often marks the Borders in [name of researcher's hometown]. After talking with my waitress about the festive atmosphere, I found out that customers here were not allowed to bring unpurchased magazines into the bistro. Hence no stack of books.

While Borders Group Inc. attempts to construct a social, sensual model of reading in all of its stores, it adapts and modifies its format to ensure financial success. Borders' decision to prohibit unpurchased print material in its bistro was, in part, a preemptive move to curb potentially destructive behavior that might reduce store spending. This policy was a major deviation from the bookseller's standard operating procedure in the United States, where its stores encourage patrons to take unpaid material into the cafés. Borders' decision to prohibit newspaper browsing in its Singapore shop was another departure from corporate standards. Collectively, these differences and others contributed to reading environments distinguishable from those that I observed and documented in the United States (Trager, 2005).

The disciplinary signs throughout the Borders store in Singapore were also in contrast to the store environment that I observed in the United States. In the Singapore store, customers were barraged with "dos and don'ts" signs such as:

For the safety and shopping ease of our customers. Please keep the aisle floors clear.
We invite you to browse and enjoy in the seating areas provided throughout the stores.

Despite its explicit disciplinary measures, Borders Singapore still held onto its reputation as a social, cool, liberal hangout place. In interviews and focus groups with young middle-class and upper-class consumers, Borders was often described as "funky," "hip," and "fun" with the "latest blockbuster books." For many educated and affluent Singaporeans, Borders constituted a spatial conduit for the articulation and performance of their cosmopolitan identity or global persona. In regard to this motivation, consider the following comment from a male Singaporean Malay reader in my Wardah Books (English Islamic Bookstore) focus group: "People are enjoying this moment. They can go to a huge bookstore like Borders in between shopping and going to a movie. And they can feel like they are a part of this global culture." In news accounts and political speeches, Borders and other transnational booksellers in Singapore were equated with the global and the modern, while local bookstores were critiqued as provincial. The majority of booksellers in Singapore modified their models to various degrees, in response to Borders' initial format innovations, as the following headline in *The Straits Times* highlights: "Times [the Bookshop] revamps to draw Borders' crowd" (Kerk, 2002).

During my fieldwork, several of the booksellers whom I interviewed conceded that they had spent time at Borders in an attempt to understand the success of its corporate model. In regard to this, a male Chinese Singaporean owner of a used

bookstore said: "One has to admit they [Borders] are successful. Our store is different, what we do is different, but I have learned a couple of things from them." While tracking the way in which Borders' social, sensual model of reading was being diffused, modified, and sometimes rejected by Singaporean booksellers, I met two former Borders employees who now own or work at an independent bookstore. They both asserted that the present stores in which they work are informed, in one way or another, by the knowledge and skills they acquired while working at Borders. Both stressed, however, the fundamental ways in which their current bookselling practices and philosophies differed (oftentimes quite intentionally) from Borders' model of bookselling.

After two years of work, Mu'Hsin left Borders to become a bookseller at an Islamic bookstore, Wardah Bookstore. In an interview, his boss pointed out several contributions that Mu'Hsin had made to his store, including the open display of books. Mu'Hsin and his boss wanted to capture some of the physical "attractiveness" that Borders embodies. Though they had few qualms with the social, sensual dimensions of Borders' model (minus a few menu items in the bistro), they thought it was missing another important "S" word: spiritual guidance. For Mu'Hsin, bookselling is a calling, and it has the potential to play an important role in spiritual development. For this reason Mu'Hsin didn't approve of Borders' "fast-food approach" to bookselling, in which booksellers seldom seek to understand a reader's knowledge and spiritual base. At Wardah booksellers are expected to offer book recommendations that are in harmony with their customers' "spiritual level."

Kenny Leck was once a shining star at the Borders bookstore in Singapore, and he even has an "employee of the month" certificate to prove it. But, a few years into his job, he became dissatisfied with the corporate culture of the store, and his performance began to decline in the eyes of his supervisor. Eventually he was fired from Borders. But this termination actually inspired Kenny to fulfill his dream of owning a bookstore that "would include all the things I liked about Borders and exclude the things I didn't [like]." Books Actually, a quirky store that specializes in literature, is the manifestation of Kenny's dream. A large sign in the middle of his store captures one of his dissatisfactions with Borders' model of reading. In big black print, the sign reads: Books Actually Worth Reading. And it is a critique of Borders on the grounds that the latter carries, in his opinion, too many bestsellers. Though Kenny has problems with some dimensions of Borders' corporate model, he admits: "I learned a lot there, and some of the things I did there, I do here [such as author signings]."

In line with the body of literature on "local entrepreneurs" and globalization (Martin-Barbero, 1993; Skalli, 2006), my oral histories with Mu'Hsin and Kenny demonstrate the powerful role that local actors play in driving global forces and local variation forward. These former Borders employees are neither victims nor heroes in any sort of stale global-local audience study plot. They are just entrepreneurs/workers who have tried to capitalize on the "local" and "global" resources at their disposal, within an evolving cultural context full of "local" and "global" constraints. Their stories illustrate some of the unexpected connections and disjunctions I made

while tracking the circulation of Borders' social, sensual model of bookselling transnationally and multilocally.

Dimension Two: Complicit Informants as Site Generators

During my in-depth interview with Kenny Leck (see above, p. 69), Enoch Ng Kwang Cheng, publisher of Firstfruits, walked into Books Actually. I recognized him from the Singapore Writers' Festival and other book events. While Kenny and I continued our talk, Enoch displayed several of his new titles in front of the store. Enoch and Kenny had become friends through their mutual interest in promoting Singaporean literature. After hearing more about my project, Enoch insisted that I should spend more time considering non-English-based print cultures in Singapore, specifically the Chinese reading/print cultures. He believed that the arrival of transnational booksellers in Singapore had also affected this sector. At first I resisted slightly: "The problem is that I don't know Mandarin," I said. Convinced that non-English-based bookstores were an important area to explore, Enoch walked me down to Bras Basah Complex (Book City), introduced me to some Chinese booksellers, and helped me conduct and translate a couple of interviews.

Though I felt some anxiety and momentary discomfort walking into these Bras Basah shops, unprepared as I was for these unexpected interviews, the information that I gathered through my fieldwork on Chinese booksellers revealed an important and surprising disjuncture. Most Chinese booksellers asserted that their stores and their activities had not been affected by the arrival of Borders' social, sensual model of bookselling. Of this, Yeng Pway Ngon, owner of Grassroots Book Room, said in our interview (translated by Enoch): "Borders has not affected us [Chinese booksellers] but Kino has, because Chinese students go there now." Chinese booksellers did not try to emulate Borders' model of reading and bookselling. In fact, several took pride in distinguishing their stores from it. Some Chinese booksellers did, however, view the Japanese-based bookstore, Kinokuniya, as a model to emulate because of its success and ability to preserve its Asian identity.

I think my collaboration with Enoch illustrates the complicit relationships that often mark multi-sited ethnography. Though these relationships can certainly exist in a single-sited audience study, they are more common and intense in multi-sited ethnography due to the various dynamics of this approach (Falzon, 2009; Gustavson & Cytrynbaum, 2003; Marcus, 1995, 2009), which include the basic realization that a researcher cannot be an expert in every potential site that unfolds. Consequently she must rely more heavily on her informants and on their knowledge of sites. Gustavson and Cytrynbaum (2003) contend that the relational dynamics in multi-sited ethnography push the researcher to multiple sites. I agree. And in this way informants become "site generators." With more sites come more topics, and diverse subjects that may surprise the researcher. In turn, these surprises, as illustrated through my encounter with Enoch, can lead to fruitful connections or disconnections.

A former reporter for *The Straits Times* was another of my informants who became a site generator. Through her I learned that the National Library Board (NLB) of Singapore drew on Borders' social, sensual model of reading in revamping the NLB and a few of its other branches. Though I had not originally planned on spending much time researching this library or its governing body, I chose to embrace a flexible research imaginary, wherein the NLB became a key site where I explored the circulation of Borders' corporate model. Through interviews with NLB members and others, I discovered that, soon after Borders arrived in Singapore, the visitorship rate at the National Library dropped. Of this, one NLB manager said: "When Borders came in, my senior quite openly said we are competing with Borders. So we adopted Borders' strategy by repacking the look and the feel of the library."

The NLB attempted to compete with Borders through emulation. "Borders [Bookstore] was used as a model for emulation, as it was successful in bringing people in and spending their discretionary spare time. By looking at how Borders displayed its books and created the 'cool' look, we [learned] from them," said former NLB Chief Executive N. Varaprasad. To emulate and compete with Borders, the NLB needed to know the specific areas in which it lagged behind its market competitor. Therefore the corporate planning division of the NLB conducted a market competitor analysis that positioned Borders as its market challenger. On the basis of the results and implications of this study, the NLB borrowed Borders' marketing concept of "the third place," along with other lifestyle retailing techniques from this commercial sponsor of literacy.

At many levels, the NLB's efforts "to revitalize the image of the public libraries and to debunk the stereotype of libraries as old, unfriendly and uninteresting" were highly successful (Library 2000, 1994, pp. 9–10). Clearly the NLB's appropriation of marketing and retailing techniques practiced by Borders bookstore and other mega-bookstores helped the NLB achieve its successful makeover. But it appears that there have been some unexpected consequences connected to this model emulation.

In a 2006 press release, the NLB reported that "[it had] seen an alarming three-fold in the number of forum letters to the newspapers about the lack of library etiquette among library users." While doing fieldwork in various libraries in Singapore, I heard numerous complaints from customers and patrons about bad library etiquette. During my focus group with Malay librarians, one woman said that "Borders-like behavior" such as "talking on the phone" and not returning books was on the rise. The following confessional comment, made by one library patron – MoMo – illustrates the sort of behavior the librarian was referencing: "I don't usually put back the magazines. Are you supposed to? I've seen others leave them on the table."

Through further fieldwork, I eventually concluded that the third-place brand and lifestyle practices that the NLB library adopted were embedded in Western capitalist habits and had corresponding ideological underpinnings, which triggered the "customer-oriented" ("Borders-like") behavior that some Singaporeans, especially the elderly, deemed "bad." Certainly the NLB's strategy of co-opting consumer culture to renew itself and to compete with transnational actors such as Borders

confirms findings in other studies, which underscore the fallacy of simplistic audience studies and political economy-based analyses that equate the local with “stasis” and the global with “dynamic change” (Smith, 2001, p. 157; Chong, 2003).

Importantly, the NLB’s version of the third place was introduced to and experienced by some segments of the local population such as disadvantaged Singaporeans, who probably would not have entered the Borders bookstore. In this way the NLB served as an important cultural mediator between local and global forces. While the NLB’s appropriation of Borders’ third-place brand demonstrates the creativity and resourcefulness of local players, it also demonstrates the constraints these agents face in controlling diffused models and concepts. Though transnational models, concepts, and practices have become dislocated from their geographical roots, they are not unmarked by their origin. My identification of the transformative modification of Borders’ social, sensual model of bookselling – as it moved through various nodes in Singapore such as the National Public Library – would not have been possible without the help of my complicit informants or site generators, as I have come to call them.

Competing Discourses, Ideologies and Conflicts Concerning Borders’ Practices

Dimension Three: Increased Perspectives Produce “Messy” Narratives

In tracing the circulation of Borders’ social, sensual model of bookselling from the United States to Singapore and then to various sites within this island nation, I was frequently exposed to competing discourses, ideologies, and conflicts concerning the reading and the social practices that this sponsor of literacy encouraged.

When the Borders bookstore opened its doors in Singapore, many local booksellers still encased their print merchandise in shrinkwrap. But Borders laid all of its books and magazines naked on the shelf and ushered in an age of unbridled browsing in this equatorial island. Since the 1990s, browsing has been an integral aspect of Borders’ “social, sensual model” of bookselling – one that helps yield an intense, experiential (“hands-on”) shopping experience for consumers (Trager, 2005). A number of Singaporean consumers, however, handled Borders’ printed material in a fashion different from what this self-avowed “leading global book seller” expected or desired.

For almost a decade, various social agents – including publishers, booksellers, “good patrons,” and newspaper editors – censured “rough book browsers” at Borders for dog-earring magazines, clogging book aisles and failing to return magazines where they belong (Trager-Bohley, 2011). In many cases, the practices and discourses surrounding the browsing debacle at Borders became “boundary drawing” activities that divided “good patrons” from “bad patrons” (Bauman, 1992, p. 677). But the more

perspectives I gathered on the browsing controversy, the more layered and tangled the story became.

One representative of an international publishing house in Singapore told me in an interview: "I don't think they [Borders] understood the psyche of Singaporean consumers; they didn't understand their conception of browsing at all." For this publisher and a few others, manic browsing at Borders stemmed from a particular psychological attitude toward shopping that the general population of Singaporean consumers seemed to embrace. Several Borders store employees, however, expressed a more specific, concrete theory. They argued that much of the wild browsing and "bad" book behavior at Borders took place in the children's section of the store, where some adult Singaporeans allowed their children to run about unattended. A few customers blamed the browsing debacle on Borders' interior design and on its "desire-to-be-different" approach to bookselling.

From the beginning of the Borders' "browsing debacle," editors from *The Straits Times* – Singapore's partially government-owned newspaper – made vague references that implicated their unrefined countrymen as the browsing offenders, even though the majority of patrons at Borders Singapore have always been middle- and upper-class cosmopolitans and expatriates (Trager-Bohley, 2011). Most of these journalists clearly put their editorial weight behind the global bookseller and positioned it as a positive "foreign talent." Here is but one example:

For all the advancements we have made in other areas, it looks like the civic consciousness department is non-existent. Unfortunately for Borders, it is light years ahead of the local yokel. [. . .] Please, you guilty ones out there, don't abuse this system and spoil it for the rest of us. [. . .] It would be good to be known for being a gracious and dignified race together with all our achievements rather than [. . .] a selfish, unrefined bunch. (Editorial by Cheong, 1997)

In newspapers, online, and in my interviews, many cosmopolitans who defended Borders echoed *The Straits Times* pro-globalization, pro-transnational corporation argument. Similarly to *The Straits Times* editors, a large number of these Borders patrons also used "otherizing" language when they criticized browsing offenders, in an effort to affirm their cosmopolitan identity through negation and to position themselves as arbiters of proper behavior and etiquette. Though many of the discourses surrounding the browsing controversy of Borders intersected with and seemed informed by a larger hegemonic discourse propagated by *The Straits Times* and the People's Action Party, a few discursive formations departed from these influences; these included the "kiasu book browsing theory," which will be discussed in the next section.

While the average reader may view book browsing as a mundane act, my research reveals the way in which this social practice became entangled in competing conceptions of reading, bookselling, shopping, and cultural values. Moreover, the discourses that spawned from "bad book browsing practices" became a "fertile ground for the reworking and reassertion of essentialist stereotypes" (Simmons & Lecouteur, 2008,

p. 668), including class and ethnic ones. However, I didn't discover this dynamic until I began to seek "outside" perspectives on the problem in unexpected, non-place-based sites. I believe that the book browsing debacle at Borders Singapore was inherently messy because it involved tracking a mobile and transformative social formation (in other words a thing, a practice, and multiple discourses) through a web of social actors who occupied different and competing positions along the global-local faultline.

Dimension Four: Unorthodox and Unplanned Sites Can Yield and Support Insightful Research Data

Audience studies scholars who track moving social formations among multiple and unexpected sites that cross-cut dichotomies such as the "local" and the "global" are inevitably going to find themselves, at one point or another, inhabiting an outsider position. While this stance is beset with challenges such as fostering informant trust, the productive discomfort that often marks it yields intellectual surprises that push the scholar to review earlier observations, theories, and fieldnotes in light of new findings.

In Singapore, my outsider position as an *ang mo* ("Caucasian person") had an impact on the multiple sites where I researched and on the relationships that I had with my informants. At times, my positionality as well as that of my informants affected the topics broached and explored during interviews, focus groups, and casual conversations. In general, Singaporeans are reluctant to discuss local politics and race/ethnicity issues in public. They are doubly cautious about examining these topics with outsiders. Though some of my informants did – guardedly – discuss race issues with me, their reluctance to do so prompted me to explore the issue of race, reading, and bookstores elsewhere. One day I stumbled upon a couple of websites where Singaporeans did open up about this topic. To my surprise, I came to regard one of these websites as a fieldsite.

Several of my informants, as well as multiple web posters on soc.culture.singapore, asserted or suggested that the browsing problems at Borders could be traced to the so-called "kiasu/kiasi offender."

ASEAN OBSERVER: When they [Borders] started this new "liberal" bookshop I was certain it was a matter of time before S'poreans showed themselves so kiasu, thick-skinned and selfish that even Borders would have to impose some order. I'm just wondering when they'll have to wrap up all of their books like the other bookshops have had to do.
(soc.culture.singapore poster)

Hwang, Ang, and Francesco (2002) have defined kiasu as an "obsessive concern with getting the most out of every transaction and a desire to get ahead of others." While Singaporean Chinese frequently banter the word around in a playful manner to poke fun at one another, it can be an ethnicized, charged word when used by others in a disparaging manner. Consequently, non-Chinese Singaporeans hesitate to accuse

Chinese Singaporeans of embodying this trait. During my fieldwork in Singapore, however, several Singaporean Indians, Singaporean Malays, and expatriates suggested that kiasu Chinese patrons were the main browsing culprits.

Although many of my interview and focus group informants initiated the topic of kiasuism, they appeared somewhat hesitant about discussing directly with me the link between ethnicity, kiasuism, and bad browsing. Online, however, this connection was explicitly discussed and quickly became emotionally charged and fueled by racism. A few bookstore patrons viewed the bad behavior at Borders as another example of the pushy, “get ahead,” kiasu attitude that marked the privileged majority ethnic group of Singapore ethnic Chinese. Consider the following exchange on soc.culture.singapore in 2002.

- APU NEH NEH: The disgusting habit of the Chinese of reserving seats can best be seen at Borders Bookstore. You will see the Chinese people take piles of books and bring them to the sofa to read the books for hours. They usually do this in pairs. When one needs to go to the toilet they will put the books on the sofa and their partner will “guard” the seat for them. Sometimes they will be gone for 15 mins to 30 mins and later come back with a new set of books. You will never see a Malay or Indian indulging in such anti-social behavior. Now it has almost become a culture at Borders.
- KNONENEH: Nothing new. Indians and other races do that too. Just another of your racist anti-Chinese posts.
- CHENG THNG: I go to Borders quite often and can verify that most of the borrowers are non-Malaysians and non-Indians. I asked a Malay colleague why and she tells me there are no Malay books there.

This charged discourse is an example of how explicit and implicit discourses about ethnicity in Singapore sometimes bubble up around seemingly ordinary acts such as browsing because the government stifles frank discussions on these topics. By tracking various permutations of the Borders browsing conflict as they unfolded in multiple (and sometimes unexpected) sites (in print, online, and in interviews), among a variety of agents (Borders employees, publishers, customers, and editors), for almost a decade, intertextual movements and disjunctures were discovered that provide insight into the interpenetration of cultural and textual practices such as reading and bookselling. Many of these connections and disconnections would not have been discovered in traditional, place-based, bounded fieldsites.

Conclusion

At this point in time, the status of multi-sited ethnographies in media studies in general and in audience studies specifically is still murky and unclear. While an increasing number of researchers in this present wave of media studies are experimenting

with multi-sited ethnography, there have been few sustained field-based dialogues about the rationale, proposed objectives, and political/ethical stakes of multi-sited ethnography. Several scholars who have conducted multi-sited or multi-sited(esque) media ethnographies have deliberately chosen alternative names to label their work. This fragmentation has made assessing the progress and innovations of this methodology difficult. This is an unfortunate situation, because, as this chapter attempted to illustrate, multi-sited ethnography has the potential to reinvigorate audience studies through its embedded elements of surprise, namely (1) its tracking strategies; (2) its emphasis on complicitous relationship; (3) its greater exposure to multiple perspectives, including multi-level power dynamics; and (4) its unbounded, open-ended notions of the field, which are not limited or constrained by place.

Surprise is an emotion that can be both pleasurable and unsettling to an ethnographer. It is the outcome of the unexpected. This unpredictability often engenders productive discomfort that drives a researcher to explore ideas and associations hitherto not anticipated, or seemingly disconnected. In this way surprise is an important intellectual tool in the field. Its value is in interrupting and perhaps displacing pre-determined research agendas and objects of inquiry. This disruption often destabilizes ethnographic narratives, offering new, “messy” layers of possibilities and questions about social formations and their conceptual offshoots. When embraced, the element of surprise may lead to a constructive process in which the ethnographer interrogates previous sites, being informed by her or his knowledge of new ones.

Though ethnographic surprises tend to undermine the unity and stability of a project, they also enlarge a researcher’s capacity to make new meaning while deepening and extending previous arguments and theories. In an age of increasingly “globalized audiences,” surprise is a dynamic element connected to the practice of doing multi-sited work, because the nature of social formations and of their conceptual offshoots will inevitably transform and change as they move through tangled and unexpected networks.

Drawing on ethnographic examples, this chapter has shown that, if media researchers embrace a flexible research imaginary that is open to surprise, modification, and the productive discomfort that comes with the unknown, multi-sited ethnography has the potential to generate greater insights into new modes of translocal social experiences and everyday life in a mediatized, globalized world than a single-sited audience/media study or a political economy-based analysis would. Moreover, its insights are more likely than those of single-sited ethnography to be multilayered in terms of power dynamics and social relationships.

Studying Audiences with Sense-Making Methodology

CarrieLynn D. Reinhard and Brenda Dervin

ABSTRACT

The field of audience or media reception studies is concerned with questions of what, when, where, how, and why people engage with media products. Across divergent fields of inquiry, research has focused on understanding how aspects of the media product, the person consuming the product, and the situation impact outcomes of reception. Amid the various options available for defining the audience and for labeling audiences on the basis of the media products they engage with, at the core of any concept of the audience are human beings attempting to make sense of their everyday lives. Woven into the fabric of people's everyday lives, the media are an integral part of audiences' attempts to make sense of the different worlds they inhabit. Dervin's sense-making methodology provides a theoretical and methodological approach to understanding audiences at the evolving time-space intersections of individual, collective, and situated dimensions. This methodology allows scholars to understand human beings' sense-making processes in the midst of contexts that constitute their daily lives, both as individuals and as parts of a collective. The chapter discusses examples of research that use the sense-making approach to study audiences' modes of "engaging" with gendered media and with virtual worlds in order to illustrate how knowledge of audiences gained via this methodology can enrich the existing work on media audiences.

Introduction

The primary goal of this chapter is to outline an intellectual and practical approach for studying audience/user reception that is informed by Brenda Dervin's sense-making methodology (abbreviated as SMM). The chapter discusses research drawn from reception studies in order to demonstrate current and potential applications of the research approach we describe here. Our main purpose is to illuminate the conceptual contours of SMM's potential usefulness for reception studies that strive to be holistic and authentic; hence the chapter refers briefly to relevant empirical projects, but it does not report comprehensively on their research results *per se*. Throughout the chapter we use research terminology – including such phrases as “life-facing,” “engaging,” and “step-taking” – drawn from and informed by the SMM approach (Dervin, 2008; Dervin & Foreman-Wernet, 2003).

SMM is a philosophically informed methodological approach that is based on a metaphorical conceptualization of human sense-making designed for systematic application to research design, data collection, and analysis. On the basis of a core assumption that human life-facing involves taking steps (material and phenomenological) across situated conditions that are, at least in part, discontinuous, SMM's metaphor is applied methodologically by directing research attention to how humans (e.g., audiences/users) take situated material and phenomenological sense-making steps, bridging gaps in time and space and arriving at outcomes that form the situated entries for the next moments in time-space. The entire framework is assumed to be metaphorically epistemological; it is not intended to be, in itself, ontological, even though, as a research tool, it is designed to attend to what is ontologically “real” for sense-makers. In our discussion we focus on how we have applied SMM to study those times and spaces where a person – the audience/user – has engaged with some media product: we refer to such times and spaces as media reception situations.

We position the focus on media reception situations as a subset of audience and reception studies. In particular, we are not discussing what constitutes the “audience” or the “user,” nor are we interested in the domestication of media products into the spheres of people's everyday lives. Instead we concentrate on the reception processes associated with engaging with media products. We define reception processes as those internal and external behaviors associated with decoding and recoding media technologies and mediated content. Thus our study of media reception situations is interested in understanding the internal and external behaviors that occur when one is engaging with media products.

To begin our discussion of how we have studied media reception situations, we will first illustrate what we see as the complexities of media reception situations by locating various factors that have historically been posited in literatures as potentially influencing media reception outcomes. We group these factors into three main categories that we conceptualize as constituting the media reception situation. These foci are:

- on the media product, the content and technology features;
- on the person, sociodemographic and psychographic characteristics;
- on the context of use, the situation, and sense-making processes.

Our assumption is that most theorizing to date has focused on the nature of the media product, the nature of the person, and, to a lesser extent, the nature of the context of use. Usually the context of use and the media reception situation have been treated as synonymous and unitary. This contrasts with how SMM implements an assumption of situationality: the idea is that events seen as unitary by outsiders can be systematically examined from the perspective of actors and how they see themselves as moving through the events in terms of material and phenomenological step-takings; these moves are sometimes informed by past habits and propensities, and sometimes by unique situations.

Our goal is to illustrate how we have used SMM in audience and reception studies to address all three contributing factors in a media reception situation through the “lens” of situated sense-making processes. To that end, we have employed SMM to inform the data collection and analysis of media reception situations.

In this chapter we present an outline of our definition of media reception as a situation of audience/user engaging with a media product; we discuss how various approaches have generally focused on some aspects of the media reception situation while at the same time pinpointing what we see as struggles; we discuss how we have made SMM assist in our understanding of media reception situations; and we conclude with case studies typical of the kind of studies we have been conducting.

Media Reception Situation

A number of different discourses have in some way dealt with the phenomena that constitute a media reception situation: an audience/user, a media product, and the contextual situation in which both are positioned. The differences across discourse communities often blind us to the fact that, at least sometimes, these communities are all pursuing reception studies when the term “reception” is used, as we use it, to focus on processes of engaging with media products. Far beyond media and communication studies, we find that in a wide array of discourse communities (e.g., political science, health education, legal studies, policy studies, art education, and management) there is growing interest in how audiences and users react to and engage with messages relayed through media products.

These scholarly treatments of “reception” have mostly pointed to two central entities: the person who is engaging with the media product; and the media product itself. Far fewer have explicitly included the contextual situation of reception in their formulations. Generally, however, it is fair to suggest that there is increasing agreement that media reception involves a social and historical situation in which an

Figure 3.1 Illustration of media reception situation. *Source:* The figure as presented is informed by Richard Carter's "picturing language" (Dervin, 2003).

audience/user engages with a media product in the context of everyday life – and the latter includes the variety of ways in which everyday life situations and the world at large can impact the person's process of engaging. Drawing on the myriad literatures that have focused their attention on the audience reception process, we offer our own understanding of how these bodies of work converge to produce a "picture" of the media reception situation in Figure 3.1.

In the figure there are four main components: (a) "the world"; (b) the situation: time-space moment(s); (c) the audience/user; and (d) the media product. Each main component is ascribed either subparts or attributes to show what we assume is the interconnectedness of the components and the deep complexity of any given media reception situation.

(a) "THE WORLD" is a shorthand term applied to the combination of sociocultural, political-economic, and historical/material conditions in which the situation occurs, with potential for impacting both the audience/user and the media product through the internalization of "the world" before, during, and after the engaging. In this model "structural conditions" are assumed to be a constant attribute of "the world," although particular formations would vary across time-space.

(b) THE SITUATION – TIME–SPACE MOMENT(S) is a specific intersection of time–space moments that provides the contextual boundaries within which the audience/user physically and interpretatively interacts with the media product. The audience/user and the media product are pictured as having some kind of connection, producing the act of engaging, within any given time–space moment. Because time–space is assumed to be constantly moving, it is likewise assumed that these interconnections may vary across time–space.

(c) THE AUDIENCE/USER is conceptualized as possessing agency, the capacity to act physically and interpretatively. Agency is, in turn, pictured as potentially being enacted in instances where it is informed and/or impacted by lived experiences and/or by the various structural groupings to which society assigns humans membership and within which individual users may (or may not) implement their agency. These include sociological and cultural groups, as well as psychological attributes that the audience/user may or may not have and habits developed over time.

(d) THE MEDIA PRODUCT contains an interweaving of technological interface and content structures that potentially cue and constrain how the audience/user engages. Additionally, content is encoded within, and from the conditions of, “the world” in which it was created. We consider these constraints and affordances to be the media product’s parameters of engaging: the requirements imposed upon the audiences/users that potentially impact the quality of engaging with the media product.

This illustration is intended to reflect what we see as a fuller picture of the complexities of a media reception situation. In the next section we describe how various discourse communities have studied media reception situations primarily by focusing on one or two of the components in Figure 3.1.

Approaches to Researching Media Reception Situations

Various discourse communities have studied media reception situations to understand (a) what has led audiences to the moment of engaging; (b) what occurred during the engaging; (c) what resulted from the engaging; and (d) how (a) and (b) have impacted (c). Usually the different approaches emphasize different components of the media reception situation, regarded as expected predictors for the processes and outcomes of the engaging. Primary approaches that have researched media reception include studies of media effects, of uses and gratifications (U&G), of film reception, of human–computer interaction, of everyday life ethnography, and of decoding/encoding (Jensen & Rosengren, 1990; Schneiderman, Plaisant, Cohen, & Jacobs, 2009; Staiger, 2005).

Media effects studies has typically been concerned with identifying what, during a media engaging situation, leads to a specified outcome – such as being more violent

or sexually aggressive. Research has typically focused on measuring the amount and type of engaging with some predetermined content (e.g., violent films, pornography), and on attempting to find a correlation or a causal relationship between this kind of engaging and outcomes. *Uses and gratifications studies* (U&G) was developed within the media effects community in order to counter a tendency for media effects studies to assume that everyone exposed to the same content would be impacted in the same way (Reinhard & Dervin, 2009). Instead, U&G sought to understand what motivated the audience/user to engage with the media product, on the assumption that, by understanding this motivation, the researcher can better predict under what conditions exposure will result in some specified effect. The utilization of the U&G concept to understand media effects has led some to label this chiefly quantitative approach as “media uses and effects studies” (Jensen & Rosengren, 1990).

Film studies has traditionally focused on deconstructing film texts as a means of understanding film productions processes and authorial intentions. Questions about the moviegoer have been handled by spectator theories (Staiger, 2005), where the reception of the moviegoer is theorized to be dictated by some aspect of the filmic text. More recently, by drawing on cognitive psychology (Bordwell, 1989) and on German reception theory (Holub, 1984), increased emphasis has been placed on the meaning-making processes that occur when an audience/user engages with a filmic text. However, as with spectator theories, these new approaches have been largely theoretical, lacking empirical evidence with which to refute or substantiate claims.

Human-computer interaction (HCI) studies, also known as design studies or user studies, is largely concerned with issues of hardware usability and ergonomics. When the research is about a media product – and these encompass, chiefly, computer-based applications (e.g., electronic games, or particular software products) – HCI studies seeks to ascertain what about the media product helped or hindered the audience/user’s engaging (Schneiderman et al., 2009). Thus, a typical research approach has involved a laboratory session whereby audiences/users are exposed to media products and their reactions are recorded. As with media effects studies, the desire has been to understand what determines the outcome of the engaging, typically conceptualized as usability.

Everyday life ethnography studies and *decoding/encoding studies* have in common their roots in qualitative methodology and in critical/cultural-theoretical considerations. Both fields can be seen as concerned with issues similar to those researched in media uses and effects studies: chiefly their object is what leads audiences/users to engage with media products and what results. However, because of differences in research philosophies, these approaches have studied the media reception situation by focusing more on uncovering the agency of the audience/user and the role of media reception in everyday life. This emphasis includes lived experiences and material conditions of each person’s everyday lifeworld, as well as motivations and outcomes of engaging.

The primary difference between everyday life ethnographic studies and decoding/encoding studies has involved the methods used to study the process of engaging.

In ethnographic studies, various methods, such as in-depth interviews and participant observation, have been used to generate a map of the various interpretative and performative acts and material objects that are part of the media reception situation. In encoding/decoding studies, individual and group interviews have been conducted to understand what Hall (1993) described as the encoding of ideological positions into media products and the ways in which people decoded, or dealt with, these positions.

Unfortunately there is insufficient space here for a full accounting of these various discourses and of their theoretical and methodological considerations. In our view, all have made important advances, but each continues to struggle with particular aspects of media reception. What we see as a struggle relates to the particular focus of each approach on the media reception situation. We review each focus below as a “lens” for studying the media reception situation: each lens offers a partial glimpse into the situation and struggles to show a fuller picture. Our intention in this discussion is to extract what we see as general patterns. Clearly there is great variability and rich depth in the way different researchers approach their studies of audience/user media engaging. For our purposes here we bracket such variability in order to focus on major thrusts.

Approach 1: Focusing on Media Product Structures

Most approaches to studying reception emphasize the impact of various assumed structures on outcomes of media reception. Usually these impacts are assumed to be constant and predictive, both in qualitative and in quantitative research: such has been the case, historically, when the structure was a material object: the media product.

Across discourse communities, technological and content features of media products and the production practices and forces that determine them are assumed to cue and constrain the type of reception possible with that media product. For HCI the focus is on the interface and on how the technology creates certain parameters of engaging, or requirements on the physical and interpretative interactivity the audience/user must perform in order to engage with the media product. For media uses and effects, film, and encoding/decoding studies, the focus is on the content; this orientation may include a focus on the ideological positions of the world argued to be encoded into the content’s message. These ideological positions, for example, may extend to messages regarding what is appropriate or not for gender, class, and ethnicity relations. Whether the focus is on the content or on the technology, typically there are assumptions about what the outcome of the engaging would be, should the audience member engage with the media product, as is expected by those who designed and produced that product.

We do not argue against the presence and potential impact of such structures. The media product is a material object that, we assume, has been produced with the intended parameters for engaging, as well as with built-in ideological meanings, be

they intentional or unintentional. A videogame requires certain types of action on the part of the audience/user, which are different from the requirements placed upon the reader of a literary novel. These requirements impact the act of engaging with the media product; should the videogame and the literary novel have the same content and the same ideologically attached meanings, the interface could also potentially impact interpretation. Thus we assume that we cannot discuss media reception situations without appreciating the structural characteristics of the media product being engaged with in the situation.

However, to conceptualize the media product's "impact" on reception in a deterministic way presupposes that every engaging with a media product, from every audience/user, must produce the same outcome. Almost all the studies focusing on the impact of media products have tended to explain audience/user differences as not being due to the agency of the audience/user, and they did so by assuming that media structures are somehow internalized by audiences/users and that this is what predicts or explains media reception outcomes. Studies arising from the encoding/decoding approach provide somewhat more leeway, by assuming that individual differences in interpretation arise from internalized audience/user structures that drive the process of audience/user decoding of content (Hall, 1993). However, this assumption involves a struggle we discuss in the next section.

Approach 2: Focusing on Audience/User Structures

This approach to studying audience reception emphasizes the impact of structures that are assumed to be internalized by, and thus to become integral parts of, the audience/user of the media product. These audience/user structures are considered to reflect the internalized impact of audience memberships in socially defined groupings based on sociodemographic and/or psychographic categories. Sociological and cultural categories include such demographics as age, gender, or ethnicity, and psychographic categories include such traits as the need for cognition, internal-external control, or sensation-seeking.

Sociodemographic categories are groupings that reflect sociocultural and historical constructions of appropriate internal and external behaviors for individuals as based on socially accepted group membership categories. Usually these categories are imposed, as if audiences/users had no agency awareness of these memberships. In some work, explicit attention is placed on audiences/users as agents aware of their socially accepted group memberships. Most research, however, assumes that these group membership categories, recognized or otherwise, have a constant and unified impact. The internalization of external membership is assumed to occur through living from day to day in societies and cultures that define what constitutes membership in a particular subgroup.

Psychographic categories, used more extensively in media uses and effects studies, also rely, although less obviously, on externally imposed and socially accepted mem-

bership groups – a reliance that should be understood in terms of various psychological theories regarding personality traits and behavioral tendencies. These socially accepted conceptualizations are then used to explain audience/user media engagements. Psychographic categories are theorized as resulting from experiential learning and/or neurophysiologic ingrainings. Depending upon which theory the researcher subscribes to, the psychographic categories may be conceptualized as being originally internal, or as being external and then internalized during a person's life.

Thus studies that focus on audiences/users often predict that the impact of media engagements results from, or is related to, sociodemographic and psychographic groupings of traits; and they emphasize how an audience/user is positioned as a member of various externally defined groupings. Like the focus on the structures of media products, the focus on structures assumed to be internal(ized) by human beings usually presupposes that all the group members will respond in similar fashion to media products. The core assumption is that, if audiences/users share common traits, norms, and values deriving from their membership, then those audiences/users would be expected to react *en masse* in a particular way toward a particular media product. Differences in the outcome of media reception situations would be expected to be greatest between members of different groups rather than between members of the same group. This assumption is usually made both for approaches that study audience members as agents endowed with knowledge of their group membership position and for approaches that consider such membership to be unconscious and unarticulated.

Again, we do not argue that such internalized structures do not have potential connections with media engagements. The difficulty, however, is that the assumption of group uniformity in reception is rarely tested. More research is needed to understand the conditions under which group membership does matter in determining the outcome of media reception situations, and the conditions under which it does not; there may be more similarities within groups than between them.

Approach 3: Focusing on Situational Structures

The last of the “structures” in Figure 3.1 deals with specific aspects of the environment and of the context within which a situation occurs. This structural category is the least studied one. In those cases where it has been studied, the assumptions enacted have tended to be similar to those we described above for structures of the media product and the audience/user.

Typically, a study's focus on situation attempts to be the description of the context, not in terms of the evolving moments of the audience/user's experience, but in terms of how an external observer understands the situation. For example, the techniques of observation of everyday life ethnography detail the surroundings in which an engaging occurs, examining how these material conditions impact media reception. In media uses and effects and in HCI studies, the situation will sometimes be

employed as a between-subjects variable and the researcher will compare locations of engaging such as workplace versus home or public versus private.

In both qualitative and quantitative approaches to media reception, there has tended to be more empirical focus on generalized media engagements than on specific instances of engaging. It is our contention that asking audiences/users about general media engagements assumes that there is stability to media engagements; for example, an audience/user who watches a television serial will watch each new episode in a repetitive/habitual way. Because the usual research approach has been to assume stability, the potential variability within different media reception situations has been left unstudied. In essence, attempts to capture a stable average representation of media engagements elide differences among these engagements.

The above does not mean that researchers have not attempted to address specific instances of engagements. However, these attempts have usually been implemented in artificially constructed laboratory or experimental situations, where attention to audience/user interpretation is lacking. We argue that, in order to understand media reception more fully, we need to introduce a treatment of situation in terms of what we call “situationality”: the nature of the situation as engaged, interpretatively and materially, in the evolving step-takings.

Approach 4: Focusing on Sense-Making Processes

The last approach addresses the potentiality for agency, as depicted in Figure 3.1. Studies taking this approach consider the sense-making processes: internal and external behaviors that occur within the situation. In our view, this aspect of media reception situations is understudied. Most attempts generalize situations in unitary ways, as they are seen by outside observers. Few researchers have examined what we think will be a productive contribution to media reception studies – namely situated step-takings through media engagements.

Some approaches have considered agency in relation to structure(s). In fact uses and gratifications, encoding/decoding, and ethnographic studies developed as a reaction against conceptions of the passive audience/user being deterministically affected by the structures we discussed. However, such studies still resort, typically, to assuming that internal(ized) structures grounded in external ones, imposed by society and culture, are determining factors in explaining, understanding, and predicting outcomes (Jensen & Rosengren, 1990; Morley, 2006).

Again, we do not claim that structures do not potentially cue and constrain reception. We do argue, however, that there is something more that we need to understand: how the audience/user makes sense of these structural features, and the play of these structural features in given media reception situations. Our use of the term “play” here is deliberate in that, while there have been many rich attempts to examine audience/user enactments of structural features (of media, of societal memberships, and of contexts of use), very few have deliberately and theoretically allowed audience

sense-making to deem structural features irrelevant, or otherwise invisible. Further, few have examined how this “play” changes in character as audiences/users move through media reception situations.

Situated and evolving audience sense-making is, for us, the missing link in media reception studies. We argue that we cannot know how media products constrain and cue reception without attempting to understand audience/user sense-making of media product structures. Likewise, we argue that we cannot assume group membership as a determining factor, eliding personal, situated sense-making without examination of that sense-making. The lynchpin for us is the question: How do the audiences/users’ views of their everyday lives, as well as their acceptance of and struggles with membership categories, relate to the way they interpret the structural features of media products, so that there results what we, as researchers, study as media reception?

As a possible way to answer this question, we will now turn to how we have used Dervin’s SMM to (re)empower agency in order to conceptualize media engaging outcomes as resulting from situated sense-making processes.

Dervin’s Sense-Making Methodology (SMM)

SMM has allowed us to move further toward our goal of determining how a person makes sense of a situation of engaging with a media product in that it has allowed us to account for the audience/user’s interpretation of various structural features of a specific media product, of any group memberships, and of the context or environment in which the engaging occurs. In doing this accounting, we have been able to tease out how these sense-makings may or may not be important factors impacting the reception of the media product. What has allowed us to pursue this goal is our use of SMM as a methodological approach informing question formulation, data collection, and analysis.

SMM is an approach that has been in development and use for some 30 years. We describe it only briefly here, attending especially to those aspects that have most informed our address of media reception studies. Figure 3.2 below illustrates the central metaphor of SMM, which draws on a wide variety of philosophic sources (Dervin & Foreman-Wernet, 2003; Dervin & Naumer, 2009). Relying heavily on the work of Richard Carter (2003), SMM uses the idea of discontinuity or gap as a central concept in its methodological foundation. Gap is assumed to be a universal of the human condition: this time-space moment is not identical either to the preceding one or to the next. Time-space keeps moving. Hence the sense-maker is always conceptualized in SMM as moving, as never complete, and as never fully predetermined. SMM does allow for repetitious, habitual, constrained interpretations and behavior, but it does not assume these in advance.

Figure 3.2 Dervin's sense-making methodology metaphor. © Brenda Dervin, 2010.

The focus on gap in SMM does not presuppose that people are constantly stopped by ontologically real gaps. Nor does SMM presuppose that every time-space moment is filled with riddles, questions, and confusions. Rather, methodologically, the discontinuity assumption allows us to attend to how audiences/users make sense as they move through the before, the during, and the after of their media engagements. In some of these movements there will be no questions asked, but only repetitions of thoughts, answers, and practices from the past. These repetitions are seen as bridges over the gap. In other such movements there will be abrupt stops and many accompanying questions. These question-askings and searches for answers are also seen as potential bridges. In other movements there will be confusions that never get resolved, and time passes creating a bridge that is constructed out of unanswered and maybe even unasked questions. Yet in other movements there will be emotional experiences, and they become the bridge.

The description above is intended to illustrate the nature of SMM, although space limitations do not allow us to capture all relevant nuances. SMM has been designed not as an ontological theory but as a tool for methodological guidance. In SMM the entire framework – what is called the sense-making methodology metaphor and is sometimes referred as “the SMM triangle” – is positioned as a metaphor. It is around

this metaphor that SMM develops a set of philosophically derived interviewing protocols, which have allowed us to address how audiences/users interpret the material and phenomenological aspects of their movements before, during, and after specific media reception situations.

An SMM interview is usually open-ended and highly structured. There is a repertoire of queries used to reflect SMM's philosophical assumptions about humans and human communicating activity (Dervin, 2008). The interview is structured so as to study human activity as being situated, as empowering the informant's interpretative experience, as understanding the informant's ever present potential struggles between agency and structure, and as always moving around and around and deeper and deeper into the informant's experience of the situation. SMM assumes that few humans come to question-answering situations that are fully articulated. There are assumed gaps among mind, spirit, heart, and body that require time for fuller articulation.

SMM interviews are always anchored by focusing on situations or events – time-space-bound moments of sense-making/sense-unmaking. A study could be interested in looking at the sense-making step-takings in just one situation, or at a series of situations that may or may not seem related to one another. Further, SMM interviewing protocols are designed to train interviewers in a new kind of listening. Interviewing is designed with a minimal imposition of researcher jargon – typically, the “nouns” of etic expertise – onto informants' experiential worlds. The goal of the SMM interview is to construct a space that facilitates and empowers informants to explain their worlds in their own terms and modes of sense-making. The SMM interview invites informants not only to describe their worlds, but to draw connections between things in their worlds – past, present, and future. As described below, SMM implements a repetitive circling of informant experiences. It may be said, by doing so, the SMM interview aims to enlist informants as fellow researchers and to empower them as theorists of their own worlds.

Across some 30 years of applications, a core set of SMM queries has been drawn from the philosophically informed SMM metaphor, and it has been positioned as constituting the essentials of an SMM interview. These queries, when appropriately adapted to particular cultural and language contexts, are considered to address universals of the human condition and the assumed mandate for humans to make and unmake sense through evolving and changing time-spaces. In the most recent formulation, these core SMM questions draw from the following array: What *questions, muddles, confusions* did you have? What *ideas, conclusions, thoughts* did you have? What *emotions, feelings* did you have? Was anything *helpful*? Was anything *hurtful or hindering*? If so, how? How did what was happening relate to your *past experiences*? How did what was happening relate to your *sense of self*? How did what was happening relate to your thoughts on *power* and how does it operate in the world around you? If you could wave a *magic wand*, what would you have changed?

In a process that Dervin labels “an archeological dig,” these core interviewing questions are applied multiple times in a given interview, and they are applied to the changing brackets of time-space. In this way SMM attempts to “surround” the situation as it

was experienced by the audience/user. The aim is to assist audiences/users to reach fuller recollections of how they saw what was happening in media reception situations at particular time–spaces, as well as before and after them, and of how they saw what was happening in those time–spaces as relating to other times and other spaces.

There is not sufficient room here to detail all the various SMM interviewing approaches; these are described elsewhere (Dervin, 2008). Across the 30 years, a number of studies have examined the media reception situation. A subsection of SMM-inspired studies have worked to map the sense-making processes in media reception situations by examining a variety of media products: Dworkin, Foreman-Wernet, and Dervin (1999) on TV news; Shields (1999) on advertisements; Spirek, Dervin, Nilan, and Martin (1999) on newspaper reading; Huesca and Dervin (2003) on hypertext versus non-hypertext; Foreman-Wernet and Dervin (2004) on elite arts and pop culture products; Reinhard (2008) on gendered media engagements; Reinhard and Dervin (2010) on virtual worlds; and Dervin and Song (2005) have employed a uses-and-gratifications analysis.

The next two sections present two case studies of reception research recently conducted by the senior author. Each case uses a different SMM interviewing approach. These two example applications of SMM to reception research aim to understand more fully how much agency and structure(s) are interwoven in media reception situations. The first case study focuses on gender as a sociocultural structure; the second, on technological interfaces as media products structures.

Case Study: Gender as Structure

One commonly used approach to SMM interviewing is the “life-line.” In this type of interview the informant is asked to recall a series of events that fit the criteria of the study’s research question. Time–space is made to cover the length of the informant’s entire life, or at least an extensive period of time. After chronological events have been listed, the informant is asked to select the ones that will be triangulated, which involves using the core set of SMM queries described above. Thus a series of situations from the person’s entire life-line are discussed. While the results yield a shallower dig of any one situation than alternative SMM interviewing approaches do, the naming of a series of events provides a looking-glass into the informant’s past and present life horizons and into how each given event fits into that whole.

This approach to interviewing was used in Reinhard’s (2008) dissertation with the goal of more fully understanding how audiences/users engaged with media products that they saw as gendered: that is, those they saw as meant more for men than for women, and vice versa. In this study the primary structure being investigated was gender as a sociocultural force that works on, through, with, and against agency to determine appropriate behaviors. Gender was studied for how it came into the media reception situation; and this aspect of it was investigated in two ways, both of them

from the audience/user's interpretative stance. First, the researcher examined how gender was perceived as impacting people's choices about which media product was more appropriate for men or for women. A second concern was to address how gender was seen by audiences/users as relating to their sense-making during the media engagements. Thus, instead of simply comparing men's and women's engagements and using gender as a predetermined differentiating factor, this study looked at how the participants saw gender as being involved in media engaging situations.

In the study, 21 male and 22 female college students residing in the United States were interviewed using a life-line interview. Participants were asked to list times in their lives when they engaged with media products that they saw as being primarily meant either for men or for women. Participants were also asked to recall times when they engaged with such gendered media products only once or repeatedly. After constructing this list, participants were asked to select one situation from each of these types, and their choice resulted in interviews for four types of media reception situations.

Each media reception situation interview began by asking what led the participant to see that particular media product as gendered. Then, by using the core SMM interviewing template, each situation was examined in greater depth. Further, participants were asked to reflect on how they thought that their responses to each query connected to their life at the time of the media engaging and to what they considered appropriate for men versus women.

Figure 3.3 presents a brief excerpt from an interview conducted with a young male, Ted, about his engaging with a romantic comic book series – a media product he saw as meant more for women. This figure shows how the questions focused on the nature of the media product (the section in white), the experience of engaging with the media product (the sections in light grey), and the follow-up questions (the sections in darker grey).

In order to illustrate how the SMM interviews elicited participant sense-makings with gendered media, we include below direct quotations. Excerpts in this first group exemplify the occasions when men and women discussed what led them to decide that a media product was meant for men (the first two quotations) versus meant for women (the last two quotations).

The explicit content. They're extremely violent, and they degrade women. There are very little female characters in the videogames, and when they are they're half naked. (Carla, engaging with violent videogame)

It's definitely a hip-hop sort of movie, and again the overt sexuality in that aspect. (Barclay, film *Coach Carter*)

Romance is for women, sex is for men. Which is unfair, 'cause I love a good romp as much as a man does, and dating is about romance. (Becky, online dating sites)

The female main protagonist. [. . .] And I got interested in it because I saw some scenes and I thought they were pretty emotionally compelling and I thought would be interesting. (Ted, romance manga)

TED, YOUNG MALE / MEDIA FOR WOMEN AND GIRLS, USED ONLY ONCE**MEDIA PRODUCT NAME:** I guess the girl's manga. *Angelic Lair*.**WHY DIRECTED TO WOMEN OR GIRLS:** Well, I guess...my friends, I didn't think about it at all when I first picked it up until a friend said, you know that's a girl's manga, right? I was like, oh yes, I guess that makes sense. A female-named protagonist, and they were fighting robots in it, kind of exciting robots, so I thought it was cool. I got interested in it because I saw some scenes that I thought were pretty emotionally compelling. And I thought it would be interesting. So I picked it up and I read it and I liked it.**DESCRIPTION:** I guess the first time I saw it or heard of it was...my friends and I had been looking through anime music videos. There was one particular one that I thought was really good. It made me...the emotional side of the music video and I saw the anime comic to it and so I thought it would be an interesting read. I guess that was my first encounter. But then I almost might have encountered it by random hanging out at stores which my friends and I did a lot at that age.**QUESTIONS, MUDDLES:** I guess after a point I wondered why it had to be a girl's manga when I was physically reading it. So I enjoyed it. I recognized the aspects but I didn't really so I kept reading it. Except I couldn't find that last issue.**LIFE CONNECTION:**

Yeah, like I said, I was at the point of coming out, if not there, and so I didn't really care as much about gender stereotypes. I had gone from not really knowing much about stereotypes, to falling in line with them and trying to fit my life into them to not really giving a damn. I think that's where I was at the time.

SENSE OF GENDERING:

Say again? Yes. Because these sissy things, you know, were not supposed to be in my territory, but...I don't know how to answer it.

EMOTIONS, FEELINGS: Yeah, I was interested in characters and I was caught up in kind of a struggle, I rooted for her...I did all the things you're supposed to do with a good story.**LIFE CONNECTION:**

Maybe a little, with what I was reading I was getting used to rooting for the underdog. It was kind of a common theme that I encountered a lot and I felt comfortable doing it.

SENSE OF GENDERING:

Yeah, I don't think guys are supposed to care all that much, but I think that's changing, especially with big time movies where there's not a whole lot of action. But for the most part, guys like action movies, and action-filled things, and they root for the underdog because they want to see him kick some ass. And they don't root for people just because they're interested in them or like them or feel connected to them. I think it's generally not acceptable for them.

HELP, FACILITATING: Yeah, it was cathartic, I'd cry a little, I'd be happy, the same thing as with fiction, I could get lost in the world**SENSE OF SELF:** I always wanted to be the hero at that point in time, so I guess, yeah.**Figure 3.3** Interview transcript excerpt for participant discussing media meant for women and used only once.

In these quotations the participants were focusing on specific structural features of the media product as attributes relevant to their decision. The structural features of media products that were designed for one gender or another concurred with the assumptions held in US society at the time as to what is appropriate media content for men (action, violence, sex, sports) and what is appropriate media content for women (romance, dating, emotions). However, while participants could readily point to the very structural features that we would assume characterized gendered media, some did so in active resistance. In these cases participants explicitly reported that they were aware that their presence as audience members was not received positively by their society.

Here is a second set of quotations that focus on how men and women regarded what their society and culture says about what is appropriate for men versus women.

I guess I was a bit confused because as kid I was kinda under impression that I could do whatever wanted, so why are these women at home and not taking an active role in the film? (Barbara, cowboy movies)

I know I'm a woman, and have sexual desires, but in my mind it's still hard for me to understand why a woman would want or feel the need to be in that industry, where it is much more acceptable for me to go yeah, a guy's into porn because that's all a guy wants, that's what we're told. (Gloria, pornography)

The whole idea of a man being really excited to get the next season of a show that's just about a bunch of women and their dating habits, where the main character is a sex advice columnist, didn't jive with my image of what men want but I found it very compelling myself. (Zane, television series *Sex and the City*)

In these examples we find each man and woman struggling to accommodate what, on the basis of their gender category membership in society, they've been told was appropriate with some experiences or interpretations from other aspects of their lives.

Of course, these quotations have been taken out of context, so they feature here outside of their relation to other sense-makings/unmakings in the media reception situations, as detailed by the participants. In the brief space allowed here, it is hoped that these quotations demonstrate that, by considering gender as part of the interpretative actions of the audience/user in the media reception situation, we can begin to understand more fully the complex ways in which gender and other sociocultural structures can be influential, inconsequential, contested, and/or contradictory when examined from the vantage point of audience member sense-makings.

Case Study: Media Interface as Structure

Another commonly used SMM interviewing approach is the micro-element interview. From the perspective of how time-space is handled, in this approach the informant essentially skips around time-space within the confines of a particular situation, attending to those micro-moments that come to mind in response to the roster of SMM queries initially applied to the situation as a whole. After this initial triangulation, which is called "level 1," SMM queries are applied to each of the responses in what is called a "level 2" triangulation. This approach has advantages in that it can more easily make for a shorter or longer interview, depending on how many times the SMM triangulation levels are used. Another major advantage is that this type offers a manageable way to ask an informant to recall a number of situations that are related to each other on several research-based criteria and then to ask informants to compare these situations to each other.

This interviewing approach was applied in our second case study. While this interviewing approach has been commonly used over a 30-year period, this particular study is an unusual application, because it also serves as an example of how SMM

can be used as an interviewing approach for data collection within an experiment. SMM has been designed as an interviewing approach applicable to any research situation in which one wishes to understand more fully what others think, feel, need, want, and how they see the connective maps of their worlds. In the research context, SMM is useful for any research application where asking questions of informants is seen as an appropriate means for data collection, be that for surveys, experiments, focus groups, or participant observation. Our argument is that SMM interviews are applicable to experimental data collection because they allow us to understand situationality as it is experienced by our informants, instead of conceptualizing the informants as passive receivers (Reinhard, 2010). This, we suggest, is essential, particularly when one is studying communication processes, because the internalized nature of the meaning-making aspects of communicating always provides the potential for the play of agency.

The intent of this experiment was to compare how informants made sense of four different media product technologies (that is, interfaces) with the same type of content – the superhero genre. This created a within-subjects experimental design, as the experiences with the media product technologies were artificial and imposed upon participants, who had little to no experience with the technologies that were exposed to them. Film was used as a primary quasi-control, as it did not require any physical interactivity; videogame was a secondary quasi-control, because it did require physical interactivity but is not classifiable as a virtual world media product. Two types of virtual worlds, one game-based and one social-based, were the last two media products included in the study.

Each informant engaged in all four media reception situations, and certain aspects of these situations were predetermined: the nature of the media product, the location of the engaging, and the level of the participant's experience with the media product. After each informant had completed these four sessions, a SMM micro-element interview was conducted in order to explore the informant's experiences in and comparisons of the four experimental conditions.

Figure 3.4 below shows the interview structure, as illustrated from Nicolaj's exposure to the Second Life media interface condition. This figure shows how the questions focused on comparing experiences (the section in white) by going in depth into each specific experience with an SMM triangulation level 1 (the sections in light grey) and by pursuing the follow-up triangulation level 2 of asking how the aspects that were the focus of level-1 responses helped and/or hindered (the sections in darker grey).

The example shows that the interviews asked participants to recount what happened in each media engaging and, once these recountings were made, to compare the experiences with each other. In Denmark 14 students and professionals participated in the study; the number was evenly split between men and women within an age range of 17 to 58. Participants had various past experiences to go with these different media product interfaces – a factor that will be taken into account as part of the context of the media reception situation in future reports emphasizing research

NICOLAJ, MALE, 31 / SECOND LIFE

BEST/WORST: That is number four. *And what leads you to say that?* Well, the fact that I still can't decide if it's an online community or a computer game. It's sort of...it seems to me that it's an online community that tries to be a computer game. And it might be my expectation of it being a computer game that is destroying my opinion of it, but it is – it takes a lot of my opinion of the game.

MAKE BEST?: I'm not sure, because I still don't know if it's supposed to be a computer game or an online community. And in my mind an online community will...is not gonna top a computer game. It's not going to be better than a computer game.

QUESTIONS: I couldn't find the off switch. I couldn't figure out how to leave.

HELP/HINDER: Well, it was pretty much the last point in a long line of disappointments about it. *How did not being able to see the point in the setup hinder your experience?* I didn't see the point in continuing it, because, well, in my mind the whole purpose of an online community is to be able to talk to more people. If I have an online...a physical online avatar in an online world, I can actually interact with more people by walking down the street, because there are more people in the actual world than there are in Second Life. In my opinion, the online community should give me the opportunity to interact with more people than normally. A physical avatar like that reduces that to almost nothing.

EMOTIONS, FEELINGS: None other than just disappointment.

HELP/HINDER: Well, it showed me that this is not the program for me. It's not something that I'll be participating in, in the future.

FUTURE EXPECTATIONS: Not really, because I hadn't...I had heard that Second Life was an online community, but I'd also heard that it was a very good online community. I didn't...on purpose I didn't check what kind of community it was because I wanted to keep an open mind about it.

HELP/HINDER: Well, if I had checked it out a bit, I probably would have learned to stay away from it from the start. Although not really, because it was a part of the experiment, right? There was no escaping it. If I had tried it before, if I had checked it out better, then I probably would have gone into this experience with a bit more prejudice than I did.

Figure 3.4 Interview transcript except for informant discussing Second Life interface experience. *Source:* Reinhard (2010).

results. For our purposes here, we illustrate how an SMM interviewing approach allowed us to address the complex intertwinings of structure and agency. To this end, we compare just two participants and their exposures to two different media interfaces: a movie and Second Life.

The parameters of the experiment allowed the participants to choose, from a library of 15 titles, a movie they had not seen. This made the comparison of movie sessions more difficult across participants, because, while the movies were conceptualized as having the same media interface, the specific content varied. However, from an interpretative perspective, since all the movies focused on “superheroes” and were “new” to informants, the novelty of content in these engagements can be considered reasonably comparable.

Unlike the movie session, the Second Life session was more controlled, in that each informant was required to go to the same place in the virtual world. However, upon arriving at this location, informants were allowed to proceed as they desired. As with the movie, then, the interface was the same, but there were differences in what happened in the virtual world, or in the content.

The two informants we are comparing are Nicolaj, a 31-year-old male whose movie choice was *The Incredible Hulk*; and Flemming, a 25-year-old male whose movie choice was *Elektra*. The Second Life site that each informant was asked to visit was “Metrotopia: City of Superheroes,” an island designed specifically for the study.

Looking at how Nicolaj and Flemming made sense of their movie interface experiences, it stands out how Nicolaj, when asked, reported that he faced no gaps in his experiencing of his movie, while Flemming had many questions and confusions.

So it really never did get you any background information of the world of the superhero, and stuff in terms of where are we, what is the background setting of this. It just gave you very few background information about Elektra and then you're supposed to know what everything else is. (Flemming, engaging with the film *Elektra*)

However, unlike with the movie interface, both Flemming and Nicolaj experienced similar gaps in dealing with the Second Life interface. In fact they both experienced similar problems in controlling objects in the virtual world.

Some of the outfits, the pieces that I chose for my avatar, didn't fit at all. I chose a cape form that latched itself onto a shoulder. (Nicolaj, Second Life)

It didn't work some of the time trying to get stuff like how to wear the freaking Japanese hair that was floating on top of my skull but then just ignore this. And I guess if I needed, I could just have asked the other characters in the game how to do stuff so I wasn't too worried about this. So in that way it didn't affect me. (Flemming, Second Life)

As seen in the previous quotation, Flemming “found” ways of bridging the gap that Nicolaj did not.

All the time, because it was quite clumsy but it was a lot of that was [*sic*] – the thing of the graphic user interface was much the same as in *City of Heroes*. But in *City of Heroes* it really mattered. I didn't feel that it mattered at all in Second Life. Until I was told how to shoot and how to engage in different combat styles, how to use my superpowers. I could just get those answers from a real live human being, and that really helped. (Flemming, Second Life)

Nicolaj also experienced gaps that Flemming did not in his Second Life journey.

It seems to me that this set-up with the avatar and the online community, it limits your access to the online community a lot. I don't see the point of because the graphics and the gameplay is very bad compared to the other three. So it doesn't really function as a computer game as such. And because you have a physical avatar in the world, it limits you greatly in terms of the online community. So I really don't see the point of the set-up. (Nicolaj, Second Life)

Even with these brief clips from some 300 manuscript pages of interview transcriptions from the experiment, we tapped into sense-making variability both within and

between conditions that began to allow us to see complex intertwinings – in this case, between media product structures and audience/user agency.

Since our purpose here is to illustrate how we have used SMM interviewing approaches in studying reception processes, there is no room to report study results fully. Suffice it to say that, in general, the experiment elicited evidence regarding how media product interface technologies generally impact sense-making, while it simultaneously began to identify patterns of similarities and differences both within and between participants' experiences and within experimental conditions that contained different interfaces (Reinhard & Dervin, 2010). We consider this to be a modest but helpful beginning to our attempts to understand what audiences/users experience in their media engagements with different kinds of media products.

Conclusions

Our research approach and these interview extracts were informed by Dervin's sense-making methodology metaphor, the core tool that organizes SMM's reliance on a broad spectrum of philosophical sources. SMM does not contest that there are structural aspects of media and life conditions that constrain audience/user interpretations. However, SMM fundamentally accepts that no audience/user interpretation of a media product can be seen *a priori*, as written in advance, by virtue of knowing something about the nature of the media product, the audience/user, or even the situation. The interpretative acts of the sense-maker always have a potential room to play. The question becomes how to conduct research in ways that allow us simultaneously to address, in systematic fashion, both the *a priori* constraint and the interpretative play.

SMM's approach to studying media reception situations has begun to provide us with the ability to understand the conditionality of the influence of structures in media reception situations. The case studies illustrate this understanding. These studies did not assume that *a priori* structural differences of gender and interface would determine the outcome of the media reception situation. Instead they sought to bring out the agency of audiences/users, as these made sense of the situations. In this way we have been able to begin to identify the conditions in which factors like gender or interface matter in determining media reception outcomes, as well as how they matter, and even why.

Of course, SMM has limitations; all research approaches do. The deep qualitative interviews can make analysis time-consuming; the amount of material gathered can appear daunting whether the analytical procedure is qualitative or quantitative. Even though SMM has been used in large-scale studies, typically fewer deep qualitative interviews are collected, in order to reduce analysis time. This strategy, of course, lends itself to criticisms of reduced generalizability. Further, as with other methodologies reliant on self-report, some critics challenge that SMM interviews are based

on trusting audiences/users to “truthfully” and “completely” recall their experiences. While SMM’s philosophical and methodological edifice has been designed to address this challenge and in fact positions it as philosophically inappropriate, it is the kind of challenge launched against all retrospective interview data. Another frequent criticism, usually originating from those who adhere to more classical political economic and cultural studies assumptions, is that SMM is like “motivational” research, because of how it elides on its metaphorical bridge such usual research categories as values, memories, attitudes, opinions, and affect. Again, SMM’s methodological foundations, drawing on sources from philosophy, neuroscience, and complexity theory, argues explicitly against these expert categorizations imposed on everyday experience.

In sum, then, we argue that SMM has given us a more holistic ability to study audience/user engagements with media products. It has helped us to understand the complexity of intertwining factors that are involved in media reception and to go beyond solitary-factor explanations. We have been able to more completely disentangle these factors while simultaneously understanding how they interact, as well as how they can be traced backwards, forwards, and sideways into the everyday lives of audiences/users.

Our work in applying SMM to study media reception situations has only just begun, but we have collected sufficient data on a variety of situations to suggest the promise of the journey. In addition to the data collections described here, as examples, we have applied SMM to the study of what audiences/users see as their media guilty pleasures, as their addictions to video and computer games, and as the lessons they learned from media characters about society and how society works.

What leads us to continue on this research trajectory is the emerging wealth and depth of the data obtained, which flesh out these situations and the extraordinary reports of human experiences within them. We do not argue for SMM as “the” research approach for reception studies. Indeed, built into SMM’s philosophical edifice is the proposition that we must surround the phenomena of our interest with every research tool possible. In this sense, we position SMM as a complement and a supplement.

The Abbreviated Field Experience in Audience Ethnography

Patrick D. Murphy

ABSTRACT

In an effort to contend with virtual fields of communication and cultural exchange and institutional constraints, a growing corpus of ethnographic work within audience studies has dispatched with the notion that fieldwork is constituted through sustained encounters in stable, situated fieldsites, thus shifting the ethnographic *mise-en-scène* to more accessible networked worlds of virtual communities or to inquiry driven wholly by prearranged interviews, conducted outside the flow of everyday practices. These shifts have converged with institutional realities (e.g., restrictive travel funds, reductions in sabbaticals, elimination of internal summer grants). Together, these factors position observation through embodied fieldwork at the margins of much ethnographic practice within media studies. Given these investigative trajectories and institutional limitations, this chapter explores how audience researchers can return to a more existentially grounded notion of fieldwork, which is capable of enriching the study of networked communities as well as other areas of inquiry. Focusing on short-term fieldwork, I use tales from the field to make a case for how and why even abbreviated site visits can generate crucial data for crafting audience ethnographies that can help us interpret better the links between media consumption and production.

It's the summer of 2009, and I am about to enter a place called "La ciudad de los niños" (Children's City), recently renamed "Kidzania," a more branding-friendly appellation: this is a theme park located inside a mall in the Santa Fe suburb of Mexico City. I am accompanied by my wife and our two daughters (ages 6 and 11), along with my sister-in-law and her two little ones (ages 2 and 4). The entrance invites us to "get ready for a better world" (preparate para un mundo mejor) – their corporate slogan – a promise based squarely on the park's delivery of "edutainment" through a variety of role playing activities.¹ The four youngsters are to be our guides and translators of this experience. After a quick scan of those in line I appear to be the only non-Mexican visiting Kidzania that day. However, once I purchase my "reservation," make my way down a corridor and through a security point, and have my "boarding pass" checked at the "gate" by a teenager who claims to be an American Airlines' employee, I enter into a world that is instantly and quite disappointingly recognizable.

The center of town, fashioned as a small town square, is defined in no small measure by its vast display of corporate logos – Avis, Cheetos, Nestle, Telemex, Purina, Barbie, Johnson & Johnson, McDonald's, Bridgestone, Coca Cola, Televisa, Panasonic, Pemex, Walmart, Cartoon Network, Domino's Pizza, DHL, Fujifilm, HSBC, Herdez, Quaker State, Proctor & Gamble, and more. But, however evident these markers of corporate culture are for me, for those unaware of or unconcerned with such things the mixture of national and international advertisements merges seamlessly into the grain of this carefully crafted community of fun, acceptance, and, above all, participation. Indeed it is a safe, kid-centered world of possibility, neatly packaged as a local and intimate space where children are made "citizens" upon arrival and, for a few hours, asked to help run the city.

My daughters respond to this invitation with a mixture of excitement and, at least in the case of my 11-year-old, with feigned sophisticated lack of interest. This becomes most evident when we wander into a discothèque sponsored by Barbie's My Scene. I encouraged them to dance on what seems to me a muy padre (very cool) elevated dance floor, complete with floor squares of the Saturday Night Fever type, lighted and choreographed. Wow, who wouldn't be inspired to boogie down here! Well, evidently my kids, who think it's very naco (tacky). Before I interpret this response as resistance to the corporate machine, I remind myself that these are the same kids who had no reservations about singing and dancing to Michael Jackson's Billie Jean in the back of their aunt's new, videoscreen-loaded minivan on the way to the mall. So it must be my presence that's in the way.

Moving out of the disco, my children show more enthusiasm about the prospects of making their own "Gansitos" (fruit-filled and chocolate-covered cakes) at a small Marinela bakery. There they become the bakers; they even work in the production line, where each cake is mechanically wrapped in the iconic gansito (gosling) cartoon character package. But there is no need for storage, as each one immediately unwraps and consumes the fruits of her labor. I make the joke (which only I find funny) that, if they ruin their teeth, they can head over to the Listerine dental service on the other side of the street; they opt instead to take to the Kidzania highways. But before Avis will rent them a car they need to be issued driver's licenses and to fill up their tanks at Pemex. When

the chore of driving gets tiring, they refuel themselves by heading over to Domino's Pizza, where they make their own pizzas, stopping at an HSBC ATM to obtain more Kidzos (the currency of Kidzania). Hunger satisfied, other possibilities await. Mexican television giant Televisa, for instance, has its own "studio" here, so Kidzania citizens who aspire to be newscasters or telenovela stars can test their performative skills. When their cash flow runs out, temp work as a fireman, doctor, model, or construction worker generates more spending cash.

At around 10 minutes to 2:00 p.m. we learn, however, that there is a Cinderella clause. "Citizenship" runs out, and Kidzania residents are forced to evacuate the town so that the new, afternoon shift of citizens can enmesh itself in better worldom. As my family and I are herded out of the complex, together with 200 or so other visitors, by a band of 17-year-old "Servicio Pan Americano de Proteccion, SA de CV" security guards, for some reason we are handed packages of Herdez pasta and led to the point where the amusement park spills into the inner bowels of the giant mall. There is no direct exit from park to the parking lot. Instead, the mall is the transition; and, as we move through it trying to locate our parking exit, Sears, Liverpool, El Palacio de Hierro, Sanborns, and TGI Fridays frame and guide our exodus. Negotiating my way through the mall I can't help but wonder that, if Kidzania did indeed offer a better world, from what world are the visitors hoping to escape when they enter? My query is not limited to Mexican audiences, as a later visit to the Kidzania website reveals that the company has set up shop in Dubai, Korea, Chile, India, Japan, Portugal, and Indonesia. Moreover, to extend the experience, the website offers downloadable Kidzania songs, ring tones, wallpaper, and something called mobile wallpaper.

In my attempt to digest the experience a bit more, I start to think that perhaps my initial inclination to recoil from this training center of consumer citizenship only thinly disguised as an amusement park doesn't generate the right questions. Instead of asking from what world Kidzania's visitors are escaping, for instance, maybe I should be asking how and why the world of Kidzania is attractive to kids and their parents. Moreover, what might this highly constructed, participatory, and performative space "mean" to those charged with its delivery?

Such questions are often difficult to pursue in situ because, even though these could serve as potential ethnographic fieldsites, it is not easy to stop people in the flow of the experience to ask. In the case of Kidzania, parents are shepherding children through a gauntlet of sensory intensity (or perhaps it's the other way around), and employees such as the American Airlines boarding personnel and security guards have tickets to check and pasta to distribute. And my kids, now back in the minivan and fully engrossed in Michael Jackson's *Man in the Mirror*, had little interest in helping me deconstruct the experience on the way home, their down time to decompress already being filled with more stimuli. Anyway, I certainly can't complete with Michael Jackson, so I am left to ponder these mediascape mysteries of production, reception, and meaning-making alone, as I peer out at the mean streets of the Distrito Federal.

I began my chapter with this tale from my family visit to Kidzania in order to help frame a methodological question: Can such site visits be constituted as fieldwork within a broader ethnography of media audiences? When my family was considering, for the first time, spending the day at Kidzania, I certainly didn't present the trip as a great opportunity to do field research ("Hey everybody, want to do a media-scape site visit today!"). Nevertheless, I have to confess that, as a media researcher, I was already taking headnotes when I went through the American Airlines gate of Kidzania. And I know I am not alone in making such generative transitions. Indeed, regardless of the original intent, media researchers are often inspired by embodied experiences of rich, performative media spaces, and in fact they are often the catalysts through which research projects are launched and elaborated. Yet at issue for me here is this: Can quick and dirty field visits – whether unplanned ones, such as what I have described above, or more deliberate and focused endeavors – provide audience researchers with the sort of data-rendering experiences that are ethnographically thick enough to stand in for more immersive and sustained field practices? Indeed, given the limited possibilities for participant observation on the part of the audiences actually consuming media, site visits have the potential to compensate for investigative gaps in ethnographic media research that is often driven wholly by prearranged interviews, as opposed to utterances delivered in the flow of everyday practices. But when do such field experiences become "ethnographic," and how might the possibilities and limitations of such abbreviated excursions be negotiated to help animate richer audience ethnographies?

Fieldwork in Media Studies

I ask these questions within a history of ethnography in media studies that has been uneven and often methodologically oblique. These questions also come with the understanding that, as the signature method of anthropology, ethnography has long been grounded in physical fieldsites, and in fact accounts of fieldwork have traditionally presented and thus constituted ethnographic evidence. As a *product*, the ethnographic text is understood to be generated by the *process* of doing ethnography, which was established through long-term participant observation. Though it may be presented in a variety of expository or narrative forms of "thick description" (Geertz, 1973), the product is an articulation of the ethnographic process (Murphy, 2008). Historically, however, media ethnographers have not established the kind of bounded, long-term fieldwork of anthropology, so the body of ethnographic scholarship in media studies has been less defined by a particular kind of orthodoxy (e.g., participant observation). Moreover, unlike what happens in anthropology, where an ongoing reformulation of what can legitimately claim to be fieldwork is taking place directly in relation to "the aesthetics and the regulative ideals of the Malinowskian paradigm of research" (Marcus, 2006, p. 2), media scholars have often been content to nibble at the edges

of this anxious reconsideration of the limits and partialities of traditional fieldwork. These tendencies have unfolded and influenced the character of ethnography in media studies for a number of interrelated reasons.

First, although the roots here are perhaps not deep, they are wide, as over the years media ethnographers have maintained a fairly flexible, at times even ambiguous, notion of ethnographic practice. In the formative years of the field, from the late 1970 through to 1980s, most media studies did not present a normative model of fieldwork that necessitated immersion, rapport, observation, and the most recognizable product of this kind of work – fieldnotes. Many followed instead the less prescriptive but nevertheless identifiable path of applying methods associated with ethnography (in-depth interviews, conversational interviews, group interviews, time-use diaries, letters, family albums, and other personal documents) in the vein of Morley, Ang, Radway, Schröder, and others who were interested in establishing an empirical commitment to the study of popular culture production and consumption. By the late 1980s the quasi-ethnographic marbling of media studies was colored further by a greater focus on political and epistemological issues tied to representation. The debate surrounding the representation of the “Other” constituted a disciplinary “crisis” in anthropology, and its force hit ethnography squarely, as a practice discursively wedded to colonialism and the objectification of non-Western subjects. But, whereas anthropologists wrestled to come to terms with the translative process between fieldwork and ethnographic text, for a long time media studies seemed content to discuss the limits of reflexivity as *the* object of inquiry, as opposed to an epistemological dilemma tied to “voice” and to “being there” and “writing here,” and this state of things prompted some to question media studies’ ethnographic commitment (Bird, 1992; Drotner, 1994; Murdoch, 1997; Murphy, 1999; Nightingale, 1993). And, although more recent ethnographic work produced by media scholars has signaled an attempt to deal directly with issues of representation, field experience, and reflexivity (Boylorn, 2008; Kim, 2005, 2006; LaPastina, 2005; Mayer, 2005; Murphy & Kraidy, 2003; Parameswaran, 2001; Podber, 2007), most of this scholarship has been generated by researchers of media and globalization.

Second, a growing corpus of media ethnography is moving away from the notion that ethnography is constituted through sustained encounters in stable, situated fieldsites. The emerging ethnographic vision can be found in the descriptive tropes now used by media ethnographers, “cultural interlocutors,” “complicity,” “lurking,” “mobility,” and “embodied subjectivities” serving in place of classic anthropological terms like “informants,” “entrée,” “rapport,” and “immersion.” This language reveals an understanding of fieldwork that is configured by a world where cultural exchange takes place, routinely now, in something called cyberspace and where social ties are shaped through things like chatting, surfing, and tweeting. But these adjustments are also more than just about penetrating virtual fields of communication and exchange, as the fieldwork itself is being increasingly defined as a dynamic, even ephemeral experience, conducted in what could be characterized as a context of fluid situatedness. Bird (2003), for instance, has called for an “opportunistic ethnography” (p. 5),

developed through “researcher-absent” methods (p. 17). She argues that media researchers should be less concerned with “insignificant” issues such as time in the field (p. 8), and they should commit themselves instead to the “ethnographic way of seeing” (p. 12). Rather than privilege immersion in specific sites, Bird places an emphasis on communication with participants and on asking the right questions, which would be designed to create situations where “the participant is invited to define the terms of the encounter” (p. 12).

Additionally, there is Hills’ (2002) reconceptualization of fieldwork as something conducted through an “ethnography of the self” (p. 81). Hills is primarily interested in fan culture, and his autoethnographic privileging of the self casts the personal–locational at the interpretative core of the ethnographic process. This move serves as a means of overcoming the limitations of low-tech, face-to-face ethnography when the subject of the research involves making sense of the multiple theaters of media reception. Also, rather than celebrating the “native’s point of view,” which he believes leads to inherently weak interpretations of fan culture because it is reliant on the “auto-legitimation within fan culture” (p. 66), Hills advocates self-reflexivity as the ethnographic path through which to question the currency of the fan’s own interpretations of media texts. Given these parameters, “the field” is an internal place for the ethnographer-fan, and self-interrogation is the tool that must constantly be deployed in order to interpret one’s own identities and affiliations within the fan communities of media cultures under study.

Somewhat complementary to Hills and Bird’s reconceptualizations of fieldwork is Couldry’s (2003) more existentially grounded, yet no less fluid argument that media researchers need to develop “passing ethnographies” capable of yielding “knowledge under certain conditions” (p. 44). At the core of Couldry’s vision of ethnography is the perception that, since people live increasingly “mediated lives,” meaning and understanding are always partial and situated. Therefore, in order to reveal patterns of thinking in media audiences, ethnography needs to be less focused on the total life contexts and more sensitive to context as something rhetorical, negotiated, and situational. In other words, instead of an encamped “being there” vision of ethnography, in line with the anthropological tradition (e.g., in the village), Couldry advocates for an ethnography that is in the moment as much as it is in the field. “Listening closely and effectively to people’s talk need *not* require a full ethnographic contextualization for that talk” (p. 52). Instead it can be spontaneous and conducted across a range of multi-sited contexts, which are built on mutual exchange (“complicity”) rather than on rapport, in order to capture patterns of cultural thought and action related to media discourses.

Taken together, the ethnographic visions sketched out by media scholars like Hills, Bird, and Couldry are less rigid and considerably more open than classic ethnography to experimentation and to an adjustment based on the communicative elements of social networks and media events. While the change in the ethnographic *mise-en-scène* may very well suggest a less rigorous connection to the concrete fieldsite and to the immersive process of participant observation, these authors nevertheless

present ideas for a new imagining – both of how ethnography can tackle more phantom-like practices of cultural exchange and information sharing by shifting emphasis to fleeting moments of ethnographic opportunity, and of how those moments are negotiated to bear ethnographic fruit.

Third, it is important to understand that, in media studies as elsewhere, the recent move to ethnographic field studies without a traditional sense of fieldwork is tied to institutional realities. At its height, anthropological fieldwork was a methodological beneficiary of university systems, at least in the US, where it was receiving huge sums of money. Today we might admit that our ethnographic cocooning is just as much a product of institutional budget cuts, which are felt by researchers most often in the form of restrictive travel funds, reductions in sabbaticals, and the elimination of internal summer grants, all of which translate into less opportunities for field studies built on “being there.” Not surprisingly, many media studies research projects consist now of “traveling” to more accessible virtual worlds, in order to study community media convergence audiences and virtual communities.

These last two factors – that many media scholars are working to establish a new sense of what constitutes ethnography and that institutional pressures shape the practice of media ethnography – underscore the observation that the ethnographic method is at a time of transition and profound change. Or, as anthropologists James D. Faubion and George E. Marcus (2009) put it, one can simply say that “fieldwork is not what it used to be.” Of course Faubion and Marcus are writing about anthropology, and so perhaps a better take on the idea that new kind of fieldwork needs to be formed is to say that, at least within media studies, “fieldwork is what we decide it will be.” In stating this I am of course poking a bit of fun (with a Geertzian wink) at the fact that media studies is in the somewhat interesting position that, since it never really had an established “rites of passage” approach to fieldwork vis-à-vis anthropology, it is, to an extent, freer to explore a new vision of ethnography. Or at least this is how it seems to be playing out. Indeed, it is quite ironic that, in many ways, the absence of a grounded notion of fieldwork in media studies has made the transition to today’s global mediascape of convergence, networked communities, and the inescapable echo chamber of corporate media messages somewhat more open to an ethnographic adjustment for the study of audiences. That is, if the politics of the rites and rituals of the field encounter was not something particularly hobbling to the enterprise of audience ethnography before, why would media ethnographers suddenly be overly concerned by their limitations in an age of emerging virtual tribes and of exponential growth in social media communities?

Observation and the Field

In mapping out some of the forces that have formed ethnography’s profile in audience studies, I want to underscore that I am not advocating a move away from

long-term media ethnographies grounded in the study of physical sites of reception and production. Rather, as I acknowledge the pressures and limitations that affect ethnographies built on extended fieldwork and I build on some of the past work that calls for an opportunistic ethnography and emphasizes the situatedness of experience and self reflexivity, I want to suggest how and why audience ethnographers might reconsider short-term field visits conducted in physical sites as a way to deepen the ethnographic commitment to the study of networked communities of media production and consumption. Indeed, as Livingstone (2010, p. 569) asserts, audience ethnography still represents one of the best ways to study ecologies of power when it remains focused on analyzing consumption's relation to production (as mapped, for instance, by Johnson's, "circuit of culture," by Hall's "encoding and decoding," and by Habermas' "life world," in concert with the "system world"). In my view, this involves investing in an understanding of media ethnography that draws on the embodied experience in the field, even if that experience is less immersive than that of anthropology's established tradition.

Consider for instance, as an extension of the audience research tradition, how the situated and sensual experiences of fieldsite visits might be employed to research the elaboration of increasingly complex and integrated "mediascapes" (Appadurai, 2003). Defined by anthropologist Arjun Appadurai as image-centered, narrative-based "strips of reality" comprised by a "complicated and interconnected repertoire of print, celluloid, electronic screens, and billboards" (p. 43), mediascapes are inflected by political and historical contexts and shape the flow of cultural capital that audiences experience. As part of an interlaced series of scapes through which social actors navigate, mediascapes serve as the building blocks of "imagined worlds" (p. 43).

My introductory tale from Kidzania hints at how a site visit can tap into the performative, participatory, and "passing" nature of some of these mediascapes, not to mention how global and locally integrated they have become over the last few years. It also illustrates how such existential experiences might serve as a point of departure for elaborating audience research – first informed by observation and then built on to move steadily toward a more identifiable audience. But digesting these experiences to initiate such an ethnographic process is no simple task, as such sites can be quite dense and fluid, and thus researching them can be more than a little challenging: although they vary in terms of size, complexity, and coherence, these are – primarily, even if not exclusively – strategic spaces of cross media marketing that are constantly being adjusted.

Nevertheless, it is because of the potential of fieldsite visits to reveal entry points into research that there is good reason to argue for an experiential, observational path to the study of audiences. Clearly, now more than ever, we live in a world where spectacle and multiplatform messaging form commercial mediascapes designed to engage individuals through their subjectivity. Often these corporate creations represent efforts to shape and sell a particular brand image, making it not just an image, idea, or slogan, but an experience calculated to inscribe a discursive frame of reference for its audiences. And, as commercial interests continue to respond to technological

innovation and seek out ways to harness its potential, such performative spaces are not just the terrain of Kidzania-type malls or amusement parks venues. In fact, in an effort to craft a better, more socially responsible brand image, many companies have taken to establishing entire media divisions dedicated to elaborating interactive mediascapes that dovetail together to shape public perception. More and more this is preformed through brand management that relies on the sophisticated interlacing of public relations, social responsibility efforts, social media (e.g., issue blogs and responsive twittering), self-publishing, employee buy-in, and strategic framing. Interestingly, these efforts have lead to some of the most diverse sites of cross-cultural interaction, production, and reception, as their audiences are comprised not only of those sanctioned as *the* consumers (say, ticket holders, shoppers, travelers, site visitors, investors, journalists), but also of those involved in the production of these sites (account managers, tour guides, vendors, sales clerks, security, maintenance workers) – and sometimes even of those more peripherally or oppositionally connected (street vendors and artists, culture jammers, activists, and the like).

To get a better sense of how and why these kinds of efforts have been designed to engage audiences, I arranged to conduct a site visit at the headquarters of a company that has invested heavily in the elaboration of its own mediascape of brand management.

Notes from a Visit to Monsanto

In the spring of 2009 I was invited to visit the Public Affairs unit of the US-based multinational agricultural biotechnology giant Monsanto and to tour their corporate headquarters. As part of a larger project I was working on, which focused on the media in the contexts of environment and globalization, I was interested in learning about Monsanto's media operations in relation to their corporate image, and particularly to the key issue of sustainability. After I undertook some preliminary research on Monsanto's product lines, following the debate about Monsanto's business practices, I reached out to the head of the public affairs office and was immediately contacted and invited to visit the company's headquarters for a tour and to sit down meeting with some members of its team – an invitation that was surprising at first, as I had been warned by colleagues how notoriously unresponsive Monsanto was to research requests.

As I was driving down the winding entrance of Monsanto Drive, it quickly became apparent that this was truly the model of a Midwest corporate campus: it was a big, almost bucolic place, located in the western suburbs of St. Louis, Missouri. Monsanto Drive is tree-lined and it twists and turns past a host of office buildings and parking lots ranging from A to X, divided into north and south designations. Various signs direct visitors to these buildings, as well as to the Monsanto Child Development Center and to the Security Office. In view of the company's rather controversial

status around the globe, as I drove in I was struck by the lack of a heavy security presence, at least one that I could see. Instead of being stopped and directed, I parked on my own in lot N-1 and wandered around several buildings, asking staff for assistance until I found the correct entrance to Building A. Once I was there, a receptionist took my name, and within minutes I was greeted by Tom, my tour guide for the day. As if to punctuate Monsanto's global reach, Tom informs me that we will be joined by the governor of the Sarangani Province in the Philippines, but he assures me that the tour will just consist of the three of us.

Tom escorts me to the R visitor's center, and on the way there we chat. I find him personable and quite knowledgeable about Monsanto's history and product lines. Indeed, he entertains all of my questions in an easy and friendly way, fielding even my most provocative questions with grace and patience (for instance when I ask about Agent Orange – a topic that Monsanto dubs a “legacy issue” – one among others). Through my conversations with Tom I learn that he is a graduate of the University of Missouri's prestigious journalism program, and was a long time journalist at the *St. Louis Post-Dispatch*. He indicates that he left the newspaper after things there became too contentious, and he stressed that he finds Monsanto a much more pleasant place to work because of its transparency among staff and administrators and because of the generally positive attitude about what the new employer stands for – something he shares with me when he confesses that, ironically, he never felt like a journalist (“In journalism, everyone had such cynical views of the world that I came home depressed and exhausted everyday”: Monsanto employee, personal communication, April 20, 2009).

To begin things, I am to take a tour before meeting with the Public Affairs team. The governor from the Philippines is already in the waiting room, and Tom directs both of us to a small theater, to watch a 12-minute video. The video is instructive; we learn that Monsanto has over 15,000 people a year participate in the tour and that the campus was established in 1964, on 500 acres. The company's showcase product has long been the herbicide Roundup, but we are informed that Monsanto now invests over \$900 million per year in research and development, 95% of which is spent on seed development and only 5% on chemicals. We are also introduced to the “Monsanto Pledge,” which is “Dialogue, Transparency, Respect, Sharing and Benefits” (available in six languages) – the central strategy through which, as I learn throughout the day, Monsanto is very deliberately rebranding itself as a food company rather than a chemical company.

When the informational video ends, Tom points to a map and explains where we will go. He escorts the governor and me down a series of stairwells and long hallways, many of which have small emergency showers outside of old chemical labs. Tom assures us that most are relics from the past and that all the old chemical laboratories have now been renovated into seed labs. As we move down the corridors, there are touch screens with short videos at each stop in the tour that orient and introduce us to the topics we are being educated about. These videos range from lessons about the oil content of corn and advice on cultivating low transfat soy to presentations

about increasing the cotton crop yield and instruction in the science of “seed chipping” corn and soy. Tom tells me that each “station” on the tour is designed to have three “take-home points,” and in fact I learn quite a lot about the scientific process behind bioengineering.

Thematically the tour is organized around the master code of “sustainability,” which in turn dovetails with Monsanto’s branding agenda of being seen as a seed company as opposed to a chemical one. This message does not just reside at the thematic center of the tour but, as I will learn later, during my round table session with the Public Affairs team, sustainability is clearly the battleground where Monsanto sees its discursive struggle with the “activists” (a term used to describe many of its critics, but particularly those involved in the organic food movement) being played out.

After the tour is completed, the Philippine governor is picked up by another Monsanto representative and led away, while Tom takes me to a meeting room for my session with the Public Affairs team. I am a bit early and the lunch buffet is still being set up as I arrive. The meal consists of grilled salmon accompanied by, as if to punctuate the morning’s learning points, a beautiful garden salad of red lettuce, red ripe tomatoes, purple onion, and other greens. Within a few minutes the members of the Public Affairs team start to make their way into the room. All are very friendly and introduce themselves. As they state their names and positions within the company, I have to admit that, even with my academic credentials, I feel quite surprised by the degree of access I am being given for this working lunch. I am introduced not only to the director of Public Affairs (the person who initially invited me to Monsanto), but also to her superior, the director of Issues and Employee/Electronic Communication. Others who join us for the lunch include the assistant director of Public Affairs, the director of Internal News and Communications, the social media specialist, the communications project manager, the research and development (R&D) pipeline director, and the manager of tour coordinators. I am given an hour and a half to interview them in round table style while we munch on the fresh garden salads and salmon.

The conversation that unfolds is not unlike one fostered in a focus group session, providing details both on topics introduced through my questions and probes (e.g., how Monsanto has used the media to address its history of highly controversial products – such as Agent Orange in Vietnam, Roundup Ultra in Plan Colombia, and recombinant bovine growth hormone (rBGH) in milk production) and on issues that emerged as the interlocutors interacted and engaged with each other (information versus spin, or outreach and science versus uninformed criticism and myth). The group genuinely seemed to enjoy the opportunity to talk to me, as well as to each other. I am also struck by how young most of the team members are, half of them being in their early thirties. All present themselves as being committed to Monsanto’s mission and troubled by the fact that that mission is largely misunderstood and unappreciated.

Emerging from my interview with the group is the assertion, which was expressed many times, that “we are a seed company.” This was thematically consistent with

the morning tour, and indeed I am reminded that legacy issues such as Agent Orange and rBGH are part of Monsanto's past. I am told that, unlike competitors such as Dow Chemical, Monsanto today has very little invested in agri-chemical research and development. One participant adds:

That's the old Monsanto, a different company that existed prior to 2000. Today we are committed to food production and feeding the world. But it's been difficult to convince people of that transition and purpose because everything we say is challenged because of our legacy. Our message is neutralized. (Monsanto employee, personal communication, April 20, 2009)

It was for this reason, I am explained, that the media team was assembled. Interestingly, they see this shift – away from the old “legacy” and toward the notion that Monsanto is a seed company – and the path leading to it primarily as a matter of changing the topic of conversation, from “how” things are done to “why.”

As I learn quickly, this is a highly sophisticated process, based on the interdepartmental communication synergy model of “Promote, Respond and Implement.” In this model the focus is not, say, on the science of developing corn with higher oil yields, but rather on the reasons why producing higher yields is important. Through this shift in emphasis Monsanto is attempting to drive public perception away from *what* it makes and toward *why* what it does has social value.

One of the main instruments through which this institutionally coordinated effort is being elaborated is the use of an employee blog. I was told that this terrain within the Monsanto mediascape is designed as an effort to “make employees ambassadors” by encouraging them to be involved in conversations about Monsanto.

In the past, many employees would go to parties or visit with friends who would say, “Monsanto is genetically altering my food and creating Franken-food,” or some such ridiculous thing. The point was, our employees didn't know how to respond to external critiques or handle difficult questions about Monsanto. (Monsanto employee, personal communication, April 20, 2009)

The blog, which was started in February 2009, was created to facilitate an employee conversation about the company, and it permitted even “extraordinarily critical” comments. In the place of photos of each employee, participants used customized South Park avatars to interact through the blog. Conversations that surfaced in the first months of the blog included serious discussions about “chronic issues” (for instance Indian farmer suicides, especially among cotton growers) as well as tackling external critiques (such as Michael Pollan's *The Omnivore's Dilemma*) or issues presented by groups most critical of Monsanto (Center for Food Safety, or GM Watch).

In addition to the blog, Twitter is used as a social media tool, in order for people to interact both with employees and with audiences external to Monsanto. According to one communications project manager, “we were given the freedom to try new directions” (ibid.). The result is that Twitter has become the communicative mode

of information exchange that Monsanto has placed at the center of its social media efforts – since the account, which was started in September 2008, quickly grew to about 900 users. Several social media specialists are assigned to answer questions on Twitter and to direct people to the company's main website for more information. Moreover, this is a way to get employees to respond to “activists,” community members, and others. Significantly, the social media specialists also see it as a “really good way to get different voices in the conversation, be those ‘activists’ who post their own preferred websites or Monsanto’s own ‘Field advisors’ (biologists who work with farmers testing Monsanto seeds) who bring their experiences in the field to the conversation” (ibid.).

The blog and Twitter are both used to direct audiences to “For the Record” – an “issues management site” presented on Monsanto’s main corporate website – so that they can access more in-depth information on a given subject. This site provides planting and harvesting updates; it also links to an informational website about specific products or issues and can be set up to email information directly to investors. “For the Record” was described to me as being “much more conversational than [a] typical information site, but not as much as a blog” (ibid.).

In addition to websites, blogs, and Twitter, Monsanto employs video and television to help shape its message. One of the most direct examples is its farm show coverage from Iowa and Illinois. The aim here is to bring the shows, via the Monsanto website, to audiences unable to attend the shows themselves. The coverage of a show is designed to “go beyond press releases” through the use of video, bloggers, and webcam coverage of events (ibid.). In addition, Monsanto has its own internal television news show, created to be a “one stop shop for information” for its employees. During my interviews, Monsanto’s Internal News and Communications director (also executive producer of the show) informed me that his aim was to create news programming that was about Monsanto and for Monsanto employees, but without it sounding like corporate propaganda; and he shared with me: “I despise spin and corporate speak” (ibid.).

Finally, there is also *Monsanto Today*, the company’s online news magazine, which is responsible for chronicling topical issues of interest for Monsanto’s investors, employees, and others, who are just generally interested in agricultural issues. In many ways this is the company’s flagship media product, and it is dedicated to establishing an official record of Monsanto’s activities and accomplishments. As one of the writers of *Monsanto Today* explained to me: “We take true journalistic principles and apply them to Monsanto issues” (ibid.).

After my lunch session with the Public Affairs team I was led to a large office area divided into some twenty smaller modular partitions. There I was given access to a number to division heads working along with the Public Affairs team to “Promote, Influence and Respond.” It was within my conversations with these division representatives that I was able to get a better sense of how “sustainability” is understood and articulated at Monsanto. During my talks with several of the social media account managers I was told that they are committed to sharing with readers how

Monsanto's investment in sustainability is really about feeding the world. To do this, they are constantly surveying other blogs, websites, and mainstream media (*St. Louis Post-Dispatch* editorials, *Huffington Post*, *The Ethicurean*), in order to gauge "what's being said and where the conversation is going." In this way they anticipate critique and are able to address issues raised by the "local food activists," whom Monsanto sees as its chief rivals in the domain of sustainability. In fact, from Monsanto's point of view, adopting social media was just a way to level the playing field and to add its own voice to the conversations. As one Monsanto social media blogger put it to me: "Sustainability was becoming *the* domain of the organic farmers, but we need to produce more food so where does the technology come in? This is our way to help people understand what we are doing" (*ibid.*).

I am taught that there are also crop-related challenges that Monsanto focuses on. The three main seeds that Monsanto's engineers have worked on are for row crops: corn, soy, and cotton. The company sees these as something less intimate or personal than fruits and vegetables, and so the problems related to them are, in its eyes, distinct. Veggies, I am told, are both more global and more local than grains are. "People put tomatoes on their tables. There's an aesthetic to them and people have an everyday connection to them. It's hard to say that about soybean or cotton" (*ibid.*).

This distinction between row crops and vegetables is addressed directly when I meet with the communications director of Seminis, a company acquired by Monsanto in 2005. Seminis has a footprint primarily in Africa, Eastern Europe, South America, and Asia, and it has worked to increase the yield of "open field" crops like tomatoes. The company's operations are smaller, since its 4,000 employees are working in 51 research stations around the world, in an attempt to keep the company's image tied to local and regional producers. This, I am explained, means that the researchers work closely with different local growers, and the focus is more on breeding than on biotechnology. To make sure that the operations don't "carry the baggage of the grains," Monsanto has elected to keep the name "Seminis," which originally belonged to a European company.

In our research we found that, though Monsanto scores high as a technology brand, it is still tied to legacy issues. The European colleagues of Seminis established a subtler brand, so we kept the name. This left Monsanto to take the hits. This positive equity transfer allowed us to maintain the focus on vegetable as food rather than agriculture. This is important because frankly, Monsanto still does not know how to "talk food." (Monsanto employee, personal communication, April 20, 2009)

The sense that people have a relationship with vegetables and that these are much more visible than soy or cotton was something that became quite salient in my interviews. One Seminis account administrator said: "People have a pastoral vision of food. Organic has done a good job of controlling this image, but there are large farms that are also family farms which grow the food we eat" (*ibid.*). Another added:

Michael Pollan's "Omnivore's Dilemma" emphasized taste in relation to sustainability. Cardboard tomatoes came from Big Ag, and tasty tomatoes from the farmers market. We are very aware that this is the perception that we need to work to overcome. So, our current push to "produce more, conserve more, and improve farmers lives" is not juts a tag line about more corn for, say, biofuel. It is also a way to think about sustainable food production. (Monsanto employee, personal communication, April 20, 2009)

The media strategies described to me and listed above are how Monsanto is attending to these image concerns, and they are of course elaborated in concert with more traditional public relations operations and sponsored events around the globe, which are designed to help craft Monsanto's image. The emphasis during my interviews was largely placed on employee response to these media, and in fact I was told that, on the basis of their own research, over 75% of all US Monsanto employees and 55% of all Monsanto international employees use the website. "Employees can be very interactive," I was informed, "adding their own video, articles and blogs." For example, one social media specialist shared with me the case of the blog "What is Corn," which was generated when a single issue took hold, and within a few hours over "110 comments appeared," being followed by people posting articles, video, and even international debates (*ibid.*).

But, as mentioned earlier, beyond targeting employees to help make them corporate ambassadors, Monsanto develops its information sites as resources for external audiences. A member of the Public Affairs team said: "we want to be positioned so that people can come to us for credible information." This sense of positioning is vital, I think, and it is reflected quite directly in the Public Affairs team's mission: "Promote, Influence and Respond." The mediascape that emerges from these distinct efforts underscores how, through cross-media, multiplatform strategies, and brand management, a corporation is attempting to *shape and guide* the contours of what is being talked about, all the while presenting the flow of ideas and information as flexible, open to debate, exploration, and argumentation, and customizable. But what becomes apparent throughout a site visit like the one I describe above is that the measures taken to create and maintain the terms of a discourse, though ostensibly under constant negotiation and open to being reviewed by audiences, are highly coordinated and driven by both corporate agendas and personal motivation – qualities not necessarily self-evident to those who might consume the company's message and interact with its mediascape.

Conclusions

The last few pages, which I presented as a mixture of narrative description, quotes from conversations and interviews, and field notes, suggest a few observations about the ethnographic quality of my site visit and, by extension, about whether a short field visit can generate ethnographically thick material for research. So, by way of

conclusion, I wish to consider some of the “take home” points – to borrow the Monsanto terminology – that the site visit of a mediascape (both in the sense that the tour is a mediascape and in the sense that the company itself is creating and maintaining one for a host of audiences) can provide for the elaboration of an ethnography of Monsanto audiences.

First and foremost, there is a sense that even a short-term version of “being there” is important for establishing a fuller sense of how, both as producers and audiences, the communities of networks involved in the delivery and consumption of the mediascape are shaped and elaborated. Nightingale (2008) reminds us that fieldwork “is based on the premise that communication is a material process in the sense that it is something that can be observed, recorded, documented, analyzed and written about,” and hence it “involves finding ways to transform the fleeting character of communication and social relations into durable analyzable forms” (p. 1). To be in the field is to observe, to experience, and to document those observations and experiences. Though my day of meetings, interviews, and tour falls well short of a field stay in classic ethnographic terms, it does offer something more than what Couldry describes as a “passing ethnography,” and indeed in many ways it does continue the Malinowskian tradition of “getting away from the table on the verandah and hanging around the village instead, chatting, questioning, listening in, looking on – writing it all up later” (Clifford, 1990, pp. 51).

More specifically, the case of the Monsanto site visit shows how even a limited field experience can provide opportunities for engagement and observation that are ethnographically evocative. Such situated, existential experiences are immensely helpful for revealing linkages and connections to social networks and for teasing out a deeper, fuller sense of how “corporate culture” is translated into “media culture” (e.g., why “sustainability” matters to Monsanto, how social media account managers see “activism,” how the image of vegetables is distinguished from that of grains by corporate divisions). In short, though partial and highly limited as a site visit, the opportunity to move about in the context of people’s professional environment allowed for a more complete, observable, and experiential understanding of the cultural communication and generative processes and roles within the Monsanto team of media professionals, their imagined community of readers, and their sense of creative purpose.

But, while data-rich, the Monsanto example still leaves somewhat open and unanswered the question: When does fieldwork become ethnographic? One day in the field, even one as productive as my Monsanto visit, does not make for a media ethnography. What it provides instead is an ethnographic path for getting the voices and images from the field into our audience ethnographies, in ways that chatroom or telephone interviews, time-use diaries or fan letters cannot. So, for audience ethnographers, the potential quality of elaborating fieldsite visits in relation to more audience-centered data gathering efforts has a number of implications. First, to achieve ethnographic validity, such abbreviated field experiences of observation and exchange in corporate sites where media products are generated can serve to comple-

ment and extend, not sit in for, the range and variety of ethnographic choices (interpretive communities studied, for example) and relationships (access and entrée to communities, friendships, key informants, and so on) that ultimately define an ethnographic product in audience studies. Second, the grounding of audience ethnography in some sort of existential place and experience provides a means through which to move closer to the investigative chore of linking and following events and activities that shape and frame the imagined worlds of media users and producers. Indeed, as Livingstone (2010) recently noted, within media studies there is *still* a “distaste for the risky negotiations with ‘real people’ on their home ground” (p. 569). To move off of the proverbial veranda and hang out in the village allows audience ethnographers to ask better questions and to engage more fully the webs of meaning elaborated between mediascapes and their audiences. Even abbreviated field experiences can be a vital tool for audience ethnography, because, with a fieldsite visit and conversations that emerge within them in tow, any subsequent analysis of audience responses to blogs, chatroom exchanges, television viewing, or other media in which an audience is immersed can be interpreted in relation to the partial knowledge gained through a range of abbreviated field experiences.

NOTE

- 1 According to its Dubai website (<http://www.kidzania.com/dubai/>), Kidzania is “an entertainment and education center for kids – the first to offer kid activities based upon the oldest game of all: role playing. This center combines real environments with activities that allow kids to play to be grown ups. It is a city scaled down to kid size where the most common establishments you would find in any city are recreated. In this city, kids learn real life skills, reinforce educational concepts from school and values the importance of each role and profession that exist in a city. All of this is possible through the concept of ‘edutainment.’”

Studying Addiction

My Journey Through the Landscape of Telenovela Consumption

Carolina Acosta-Alzuru

ABSTRACT

There are stories that are addictive. In particular, there are some stories, originally scripted in Latin America, that constitute a pandemic transmitted daily via the television screens of more than 130 countries. These serialized dramas are called telenovelas, and the simplicity of their codes belies the complexity of their production and consumption. This chapter focuses on the audience study aspects of my journey through the telenovela landscape. Telenovela consumption loci defy national borders. Such consumption occurs not only via television, but also on the Internet. Hence, in addition to the use of interviews, focus groups, and participant observation in Venezuela, my studies have required my presence in the swampy grounds of Internet message boards dedicated to telenovelas and in social media outlets where my movements are still somewhat tentative. The chapter's tone varies from descriptive to personal as the chapter itself chronicles more than a decade of research attempting to understand telenovelas' addictive soul.

There are stories that are addictive. In particular, there are some, originally from Latin America, that constitute a pandemic transmitted daily via the television screens of more than 130 countries. These serialized dramas are called telenovelas, and the simplicity of their codes belies the complexity of their production and consumption.

The main fare of every telenovela is a central story of heterosexual love, hindered by intrigues and obstacles. But not all telenovelas are the same. They are usually located in a continuum between the traditional *telenovela rosa* and the so-called *telenovela de ruptura*. The traditional *telenovela rosa* is a Cinderella story where the two main characters usually belong to different socioeconomic strata. These telenovelas offer a catalog of Manichean characters. Villains are evil and conniving, and the heroine is virtuous, naïve, and sweet. The love story's context is of little importance. In contrast, in the *telenovela de ruptura*, political and sociocultural issues provide a realistic environment for a love story in which characters are complex and not always predictable (Steimberg, 1997; Acosta-Alzuru, 2003b).

Telenovelas are much more than melodramatic stories of star-crossed lovers. They constitute one of the biggest industries in the television business and a commodity in the international market. Telenovelas are creations for those who write and work in them, and ratings and shares for network executives. Most importantly, they are a staple in the daily media diet of those who consume them. For me, telenovelas are an endless and complex object of study. They are a privileged epicenter where we can examine media, culture, and society; a reflection of Latin America; one way to decipher my country, Venezuela; a constant academic challenge; and the territory through which I have been traveling for a decade.

This chapter focuses on the audience study aspects of my journey through the telenovela landscape. Telenovela consumption loci defy national borders. Such consumption occurs not only via television, but also on the Internet. Hence, in addition to the use of interviews, focus groups, and participant observation in Venezuela, my studies have required my presence in the swampy grounds of Internet message boards dedicated to telenovelas and in social media outlets where my movements are still somewhat tentative.

In this chapter, which both summarizes my work and reflects on the research process, I describe how I follow telenovela consumption and interact with these shows' audience members. First, I present an overview of my research on telenovelas – the itineraries of the four case studies I have undertaken, the questions that guided them, and the methodological choices I made to investigate the audience in each instance. This section provides the big picture of a decade of research and the context for the chapter's second section, where I offer brief tours through the reality of studying the telenovela audience in different sites and via a variety of methods. The essay ends with a concluding section that reflects my journey still further and takes a peek into my future travels.

Throughout the chapter I write in the first person and use vignettes to give the reader a glimpse of telenovela audiences and of the experience of taking their pulse, even across geographic distance. But the tone of the two first sections is different. The "Itineraries" segment is more descriptive, and the "Walking Tours" is more intimate and reflexive. The two tones signal (sometimes in an uneven and choppy manner) my progression from an "observational" to a "reflexive" technique of representation (Murphy, 2008).

As I acknowledge my writing's uneven tone, I am keenly aware of the implications of these representations and of how they "draw attention to or obscure the relationships developed, dilemmas faced, and surprises encountered via our own ethnographic encounters" (ibid, p. 283). I am also painfully conscious of the main reason for those variations in my tone: they offer evidence of my own struggles to detach myself from the more traditional (and "safe") forms of academic writing that I was socialized to pursue, and they allow instead personal reflection and critique to govern my writing in the same manner in which they have become the heartbeats of my prolonged academic immersion in the study of telenovelas (Lindlof & Taylor, 2011).

This chapter, conceived for a volume focused on audience studies, touches on inextricably related topics like fandom and online ethnography, which are complex and worthy of extensive and in-depth treatment, but beyond the scope of what I can provide here. In other words, the chapter is not about fandom;² but you will encounter fans as you read it. Neither does my account foreground online ethnography or its academic literature,² but you will find me wrestling with issues of identity as I walk through message boards and social media.

Finally, although I am mindful that, for some scholars, "audience-based identities and tastes [can be] seen as a threat to academic identity" (Hills, 2007, p. 44), I do not shy away from my dual identities of media academic and member of the audience I study. In that sense, when I conduct my research I do not set myself above telenovela watchers or apart from the popular culture we all consume. The travelogue that follows this brief introduction reflects my commitment to seeing myself as being thoroughly entangled in the phenomena I study and write about.

Itineraries

Ethnography is a multi-faceted process in which the requirements of detail and richness, rigor and systematicity, have to be carefully balanced, and where there is no single methodological procedure.

(Morley & Silverstone, 1991, p. 160)

Research motivated my journey through the landscape of telenovelas. Theory illuminates my path. Research questions determine both my itineraries and the methodologies that organize my voyage. But my ride is also intensely personal. None of my previous objects of study had stretched my academic muscles and challenged my determination as much as telenovelas do. After six years of immersion and training in US academia, telenovelas reconnected me with my country of birth and allowed me to understand like never before its political, social, and cultural environment.

1999–2000: *El país de las mujeres* (175 episodes)

- *Destination*: gendered Venezuela
- *Packing list*: in-depth interviews and focus groups, after the telenovela ended
- *Travelogue*: Acosta-Alzuru, 2003a, 2003b, 2003c

“You know, Carolina, we’re watching this telenovela in Venezuela that you might find interesting,” commented my friend Fernando when we saw him in Miami in February of 1999.

“Really? Why?”

“It’s different. It’s about a group of women who’re cousins. It isn’t like the typical dumb telenovela. These women say interesting things and their stories are realistic.”

“Mmm . . . what’s its name?”

“*El país de las mujeres*.”

“*The Country of Women* . . . Great title! I’ll be on the lookout for it. Maybe I’ll get lucky and Univisión will show it.”

I was lucky. A couple of months later Univisión started broadcasting *El país de las mujeres*. My friend was right: this telenovela was different from the traditional *telenovelas rosa*, with their repetitive love stories and trite language. I was hooked and intrigued. Soon I was analyzing the audiovisual text and wondering how the Venezuelan audience – soaked in the dual ideologies of *machismo* and *marianismo* – was reading these storylines and dialogues with feminist overtones.³ In addition, I was surprised to learn that *El país de las mujeres* was not written by a woman, but by the Venezuelan poet Leonardo Padrón.

Hence, after months dedicated to the textual analysis of *El país de las mujeres*, I decided to go beyond the text. Using the “circuit of culture” (Du Gay, Hall, Mackay, & Negus, 1997) as an organizational tool, I designed a comprehensive study that required a methodological mix: interviews and focus groups to study the audience, and interviews with the writer and cast members to examine encoding. Existing scholarship on telenovelas suggested that my project was ambitious. I was determined, though. Thanks to a Junior Faculty Grant I traveled to Venezuela, where I conducted interviews and focus groups after the telenovela’s final episode had aired.

I returned to the US energized by the evidence I had gathered. I also experienced the satisfaction of getting the work done and the mixed emotions of fulfillment and anxiety that precede analysis. At the same time I had a budding concern: since I do not live in Latin America, would I be able to continue studying telenovelas? Soon I set aside my preoccupation and immersed myself in the analysis and writing of conference papers and articles related to *El país de las mujeres*. Meanwhile Venezuela entered a new historical stage, as it became increasingly polarized around the figure of President Hugo Chávez.

2003–2004: *Cosita Rica* (245 episodes)

- *Destination*: political Venezuela
- *Packing list*: in-depth interviews, focus groups, participant observation, questionnaires via email, and observation of message boards
- *Travelogue*: Acosta-Alzuru, 2007, 2010, 2013.

I returned to my country in June 2003, after the failed April 2002 coup attempt against President Chávez and the two-month national strike of December 2003–January 2004. Venezuelans were deeply changed. Politics and the rigid logic of polarization had invaded everyday life, labeling and dividing the population into pro- and anti-Chávez opposing sides. This time my research goal was more modest: to interview people who worked in the telenovela industry and to learn their opinions regarding the kinds of stories that could and should be told in a politically charged Venezuela. After interviewing actors, producers, and network executives, I returned to writer Leonardo Padrón's house. He was writing the third episode of his new telenovela, *Cosita Rica* (*Sweet Thing*), scheduled to air in September:

"I want to tell the immense and passionate love story of the protagonists. At the same time, I intend to tell the story of this country's deep division. Therefore, the antagonist will be the president of a corporation in which employees are divided. Some admire him and some loathe him."

"You mean like a metaphor of Venezuela?" I asked.

"Exactly!"

Research questions raced through my mind: How would my polarized country receive this telenovela? Would they decode the metaphor? How soon? How would the government react? Could the writer pull this idea off? My academic instincts went into high gear: "I MUST study this one as it happens!" But how could I? The writer assured me that I would be granted the access I needed to study his creative choices and decisions and the production process. But the geographic distance was a reality I needed to deal with. I applied successfully for a grant from the Willson Center for Humanities and Arts at the University of Georgia and traveled to Venezuela four times during the 11 months when *Cosita Rica* was on the air. Audience members were first interviewed in person and then I requested them to answer questions via email every two weeks. I monitored message boards, interviewed some of their participants, and analyzed *Cosita Rica*'s ratings and shares on key dates. The production aspects of my study included over 30 hours of interviews with Leonardo Padrón and more than 40 hours of conversations with actors, directors, and production team members. In this way I was able to follow continuously both *Cosita Rica*'s production encoding and the audience decoding.

Cosita Rica represented political Venezuela. I dedicated innumerable hours to the study of the many metaphors and allegories included in the telenovela and to

the production and consumption of its carefully calibrated mix of romance, reality, humor, and commentary. Given the country's deep polarization around the figure of Hugo Chávez, I was particularly interested in the audience's reception of the telenovela's political critique. *Cosita Rica* marked my definitive intellectual and emotional return to Venezuela, as I connected with my country through my scholarship. This case study became my first book written in Spanish (Acosta-Alzuru, 2007). It also placed me, for good, on a parallel route to writer Leonardo Padrón. I realized that the engagement of his stories with political and sociocultural issues rendered his telenovelas a particularly suitable epicenter for the examination of the links between media, culture, and society. In consequence, now that I felt I had "conquered" the geographic distance and knew I had the stamina required for these complex studies, I was determined to continue studying Padrón's telenovelas. For his part, he was comfortable with my inquisitive presence close to his work and gave me increasing access to his creative process.

2006–2007: *Ciudad Bendita* (204 episodes)

- *Destination*: vain Venezuela
- *Packing list*: in-depth interviews, focus groups, participant observation, questionnaires via email, observation of message boards, and daily access to ratings and shares
- *Travelogue*: Acosta-Alzuru, 2008a, 2008b

My country is obsessed with physical beauty. We take immense pride in our 70+ international beauty crowns. And, even though 51% of Venezuelans live under the poverty line (Ponce, 2009), they spend more on cosmetics and beautifying procedures than on education (Delgado Barrios, 2006). The use of plastic surgery is widespread. Venezuela ranks among the top three countries in the world for plastic surgery (Sosa, 2001; International, 2007). The media deliver a steady diet of perfectly shaped women and men. And telenovelas are no exception.

In this context, Leonardo Padrón wrote *Ciudad Bendita* (*Blessed City*) with the explicit purpose of critiquing Venezuelan vanity and obsession with beauty. In particular, the protagonists transgressed the beauty code (she has a noticeable limp that cannot be cured, and he is not handsome). They also deviated from one of the telenovela's most enduring codes: protagonists meet and fall in love immediately, before a series of obstacles and misunderstandings keep them separated for most of the episodes until the happy end. In *Ciudad Bendita*, instead, protagonist "Bendita" is infatuated with the antagonist for the first 50 episodes, and only falls in love with protagonist "Juan" after episode 70. Furthermore, in addition to its atypical protagonists, *Ciudad Bendita* included storylines that criticized the national fixation with physical appearance, eternal youth, body image, and plastic surgery.

With so many violations of the telenovela code, could *Ciudad Bendita* succeed in the aggressive ratings war? Would the audience decode the critique? These were the main questions that directed my examination of this telenovela, my third case study.

I was interested not only in those viewers who watched *Ciudad Bendita*, but also in regular consumers of telenovelas who rejected its transgressive codes and stayed away from it.

The audience research design was very similar to the one adopted in my previous study. I traveled to Venezuela four times, in order to conduct interviews and focus groups and to observe families that watched *Ciudad Bendita*. I also took the pulse of viewers via email questionnaires and phone interviews, which allowed me to breach the geographic gap. There was one important addition to my methodological toolbox, though: I had access to ratings and market shares on a daily basis. These numbers rounded up my understanding of audience behavior, as they gave me snapshots of *Ciudad Bendita*'s consumption that complemented nicely my qualitative research. And, since television production and consumption are deeply connected and mutually articulated, it was particularly helpful to analyze the numbers that constitute the currency of the television business and determine the professional survival of those who work in it.

2008–2009: La vida entera (120 episodes)

- *Destination:* the “universal” telenovela made in Venezuela
- *Packing list:* in-depth interviews (in person or via Skype), focus groups, participant observation, questionnaires via email, observation of message boards, analysis of daily ratings and shares, social media, and chats via Blackberry Messenger
- *Travelogue:* in progress

Venezuela has long been considered a major player in the international telenovela market. But, in the last decade, the country's productions have lost ground to telenovelas produced by creative newcomer Colombia, traditional rival Mexico, and powerful Miami-based Telemundo (owned by the US network National Broadcasting Company (NBC)). By 2008, although Colombian telenovelas included a wide range of storylines, Mexico and Telemundo privileged melodrama and trite romance over telenovelas with local flavor, which incited reflection about gender roles and political and sociocultural issues. In addition, the Venezuelan telenovela industry had both struggled with and been shaped by the internal political forces of polarization, government–media belligerence, and media regulation that have characterized the presidential tenures of Hugo Chávez (Tremamunno, 2002; Cañizales, 2003; Marcano & Barrera Tyska, 2004; Acosta-Alzuru, 2007).

For 50 years, privately owned networks Radio Caracas Television (RCTV) and Venevisión battled against each other fiercely, in a ratings war that defined Venezuelan television and its telenovela industry. The latter has also been marked by the changing relationship between these networks and the Chávez government. After a brief honeymoon period with the president, both networks joined the ranks of the opposition until July 2004, when Venevisión drastically moderated its editorial line after a much-publicized meeting between its chief executive officer (CEO), Gustavo

Cisneros, and Chávez. By 2006 Venevisión was not broadcasting any content that was critical of the government. In contrast, RCTV maintained its oppositional stance. In May 2007 the government did not renew the network's 50-year-old license. RCTV ceased to exist as a commercial network, and Venevisión was suddenly in the unusual position of being assured of high revenues in Venezuela regardless of the quality of its programming. Venevisión's executives decided to prioritize the international market over the captive local audience by producing telenovelas "devoid of local flavor that tell universal love stories" (Arismendi, 2008).

Leonardo Padrón, who had given Venevisión four of its most resounding successes – *Contra viento y marea*, *El país de las mujeres*, *Cosita Rica*, and *Ciudad Bendita* – is well known for his competitive nature and for the strong local flavor and realistic context of his stories. However, in 2008 he wrote telenovela *La vida entera* (*A Lifetime*) under unprecedented circumstances: there was no domestic competition, but there was instead an order to write a "universal" telenovela, without local references, that would compete effectively in the international market. Hence my research questions focused on whether the audience would embrace this mandated change in the writer's style and storylines. Would Venezuelans still be able to recognize themselves in this telenovela (as happened in previous telenovelas written by Padrón)?

I traveled once to Miami, the "Mecca" of the international telenovela, to conduct interviews with writers and network executives at Univision and at Telemundo. These conversations, focused on the area of production and marketing, provided important clues for the audience dimension of the study.

I visited Venezuela three times and introduced a few changes to the methodological design of this case study. These modifications were the product of four new developments: the unavoidable presence of social media, the possibility of conducting video interviews via Skype, the generalized use of Blackberry devices in Venezuela, and the international consumption of the telenovela via video sharing services and webpages.⁴ Facebook became the newest site in my collection of loci where I gathered information about audience reception. I monitored Facebook pages related to *La vida entera* and created a Facebook group for it, where viewers exchanged opinions and I had the possibility of suggesting discussion topics. In addition, YouTube and other video sharing sites blurred the geographic borders of *La vida entera*'s audience. For the first time my study counted on audience participants located in the United States and Europe. Skype allowed me to conduct interviews that were closer to a "face-to-face" experience than regular telephone had permitted. Finally, the widespread use of Blackberry smartphones among many of my audience research participants gave them the opportunity to comment spontaneously on the telenovela, without waiting for my prompts or questions.

* * *

The itineraries I have charted thus far show that I started my journey by conceptualizing the audience as a group bound by geography – Venezuela – and by its

consumption of a specific telenovela – *El país de las mujeres*. My first methodological toolbox was conventional: interviews, focus groups, and participant observation conducted in Venezuela. As I delved deeper into the topic, my notion of the audience became defined less by geography and more by telenovela production and consumption as signifying cultural practices. This translated into an increase in the number of sites where I could observe and analyze the telenovela audience. In addition, my determination to monitor reception throughout the lifetime of particular telenovelas and the rapid development of telecommunications technology expanded my catalog of methods and gradually increased the opportunity to gather participant-generated information.

Walking Tours

It is a qualitative research tenet to combine emic and etic perspectives so that they provide a multidimensional view of culture (Denzin & Lincoln, 2005; Lindlof & Taylor, 2011). And it is the experience of many that you can understand the essence of a city only by walking through it. This section relies on these two principles. It consists of short “walking tours” through the locations where I study telenovela audiences. In them, I offer specific research anecdotes and some of the reflections that they have elicited through the years.

An Eclectic Neighborhood: Family Rooms, TV Rooms, Bakeries, Coffee Shops, and the Internet

In Venezuela I use traditional qualitative methods to study the audience: interviews, focus groups, and participant observation. One of my favorite and most useful research routines is to watch, in the company of a family at home, an episode of the telenovela I am studying, and then to follow up on this observation exercise with a focus group.⁵ It is not difficult to find participants for these occasions. Venezuelan families usually watch the 9 p.m. telenovela together (Barrios, 1988; Acuña & Blanco, 1994; Vallenilla, 1994; Marín, 2003). I observe as they watch and comment on the episode, jotting a few key notes and taking many “headnotes” (Emerson, Fretz, & Shaw, 1995). I am particularly interested in participants’ reactions and comments related to my case study’s research questions. At the same time, I take note of whether they give their exclusive attention to the show or just watch it while they do something else. I also notice who is in charge of the remote control and how certain characters, storylines, or dialogues trigger responses and emotions in each family member. These observations help me tailor my prepared focus group guide to this particular party. Hence I put the same questions to every family that participates in my study, plus some questions that I craft on the spot, which are specific to each group’s consumption experience. These are rich evenings, which do not end

when I arrive home. They require several hours of writing, as I expand my fieldnotes before I finally go to sleep.

Supposedly, I was taking a two-day break from my research at the beach condo/club outside of Caracas where I have vacationed since my childhood. But, as the evening progressed, I knew I had to watch the telenovela I was studying at 9 p.m. The TV set in our apartment is tiny and unreliable, so I decided to go to the TV room in the clubhouse. Hopefully people would be watching *Cosita Rica*. I arrived at 8:50 p.m. and the room was already nearly full. I sat in the last row of chairs. About forty people, ranging from children to senior citizens, waited for the evening's episode. The television was already tuned to Venevisión.

When *Cosita Rica* began the room was suddenly quiet. Everybody watched intently until the commercial break, when they all started talking at the same time, commenting on the telenovela within their small group of friends. I was furious at myself: I had not anticipated that this could be a research opportunity! Therefore the queen of notepads, writing utensils, and research gadgets did not even have a pen! My hands clenched tightly the only object I had with me: the keys to the apartment.

I noticed a girl in the middle of a group of tweens. She was probably 12 or 13 years old. The girl was imitating "María Suspiro," one of *Cosita Rica*'s most popular characters. Its storyline of identical twins separated at birth, who fall in love with the same man, had captured Venezuelans' imagination. My study already indicated that this was the telenovela's overwhelmingly favorite storyline. I observed the girl intently as she spoke to her friends using María Suspiro's nasal tone, vocabulary, and mannerism. Her friends laughed, delighted with the impersonation. She repeated the routine during every commercial break. Her audience increased every time and roared with laughter. When the episode ended, a lady who was probably in her 70s turned to the girl and asked: "Please, can you do the María Suspiro thing one last time before we leave?" Without a shred of shyness, the girl agreed. For about 15 minutes, people in the room interacted with "María Suspiro" before giving the girl (and the character) a standing ovation.⁶

In Venezuela I also conduct face-to-face in-depth semi-structured interviews with audience members. I use an interview guide that includes questions that are particular to the telenovela I am studying and queries that explore telenovela consumption in general. During the interview I often show participants specific telenovela scenes to set up a particular discussion topic. For this reason, ten years ago I would conduct all interviews at a central location, where I had a TV/VCR unit. Now I can show the scenes on my laptop, and conversations can take place wherever it is most convenient for the participant: homes, restaurants, coffee shops, bakeries.

If the participant agrees (and, so far, no interviewee has ever declined), this first interview is followed by periodic email questionnaires and occasional exchanges

through chats and interviews via Skype.⁷ My goal is to follow the audience throughout the telenovela's lifetime, even if I am away from Venezuela. I should note that my audience studies require information gathered on the production side of my study. Especially day-to-day knowledge of each episode's content, before it is actually broadcast, informs some of my audience questions. The end result is a wealth of evidence regarding the telenovela reception process and its articulations to the cultural context and to other moments in the circuit of culture: representation, identity, production, and regulation.

Participants enjoy the opportunity to express their thoughts and opinions about their favorite television show. At the end of the study, when I ask them to reflect on the experience of being a research participant, they write lengthy paragraphs explaining why they looked forward to our conversations and to my emails. They also admit that participating in the study encouraged them to become aware of details about the stories that they never noticed before. Some of them even say that being in the study "changed" them as viewers.⁸ Most importantly, they felt that my research gave them a "safe and serious" space to talk candidly about telenovelas.

The delicious aroma of coffee and baked goods permeated the air of the pastry shop where Gabi and I were about to meet. It is a smell that never fails to work a miracle on me: it reconciles me with my troubled country, where research can be an uphill battle.

I glanced at my watch. It was 4 p.m. I had been there for ten minutes already. I looked around even though I knew that Gabi would probably be late. After all, it is almost impossible to find a Venezuelan who will arrive punctually to a meeting; especially in Caracas, where traffic is maddening. This is why I always use the tried-and-true strategy of telling my participants how I will dress for our meeting, so I don't have to be on the lookout for them for an extended period of time.

I concentrated on my notes and didn't notice Gabi's arrival, ten minutes later. "Hola, are you Carolina?" I looked up and saw a young woman whose outfit was obviously similar to the way *Cosita Rica*'s protagonist, "Paula C.," dressed in the telenovela. As I thanked Gabi for coming and offered her something to eat and drink, I noticed that she was even wearing a choker with her initials, just like "Paula C." did.

During the interview it became clear that Gabi was a huge fan of this telenovela, and particularly of Fabiola Colmenares, the actor who played "Paula C." Gabi even confessed that she had modified her wardrobe to dress like this character at all times.

One hour later, when we were wrapping up the interview, I heard a cell phone ringing with the unmistakable tune of *Cosita Rica*'s musical theme. I looked around trying to guess where the sound was coming from. Gabi laughed, "It's my phone. Now you know how crazy I am about this telenovela!" Then she stood up

and raised the back of her top to show me a small smiley face tattoo on her lower back. She proceeded to explain that *carita feliz* was the nickname she had assigned to the telenovela's male protagonist. "I'm in love with him, and I don't know what I'm going to do at 9 p.m. after *Cosita Rica* ends!"

Walking on the Wild Side: Life on the Message Boards

Lindlof and Taylor (2002) explain it well: communication and community are linked. The context of communication is the community, and the circulatory system of the community is provided by communication. Furthermore, the relationship between communication and community has been marked by technological developments – the telegraph, the railroad, and the telephone (Carey, 1989). Similarly, advances in telecommunications, new media, and the Internet sustain virtual communities. Internet message boards are examples of virtual communities built around a common interest, where users post and respond to other users' posts. These messages are organized and archived by topics (threads) defined by the users whose communication is asynchronous.

The number of message boards dedicated to telenovelas seems infinite. Every country where telenovelas are consumed has several of them, most telenovelas have their own, and networks and production companies host several message boards too. Their level of activity varies greatly. Some have a handful of posts per day, while others have an overwhelming number of messages and threads. For example, back in 2005 when I had been observing message boards for a couple of years, Univision already hosted more than 800 of them; the boards had 3 million users who exchanged 30 million messages per month (Pisani, 2005). Today those numbers are even bigger.

In my case studies, I monitor daily several message boards, all written in Spanish:

- the board that is specific to the telenovela I am studying (for example, *Cosita Rica*: <http://www.network54.com/Forum/223657/>);
- the boards of the telenovelas that compete directly against the one I am studying;
- TVVI (Televisión Venezolana e Internacional), the most popular board dedicated to Venezuelan television. About 90% of its posts are related to telenovelas (<http://s6.zetaboards.com/TVVI/forum/14090/>);
- Recordar es Vivir, international message board focused on telenovelas, where Venezuelan telenovelas are a recurring topic of discussion (<http://www.network54.com/Forum/243414/>).

These message boards offer an array of content: from valuable information to the repetition of gossip and press speculation of the worst kind. We can also find in them specialized voices coexisting with mini campaigns designed to manipulate public opinion.⁹ Board participants live around the world and are fluent in Spanish.

They range from those who consider telenovelas an art form to those who see these shows exclusively as a source of gossip. Some users are polite, while others are extremely rude.

Most board participants feel the need to hide their true identity behind a pseudonym (“nick,” an obvious shorthand for the English word “nickname,” is the term used by board participants in Spanish). For personal and/or professional reasons, some board users lurk and participate very little. There are others, however, who take advantage of the anonymity that their “nick” provides to cultivate a particular agenda: either to promote/defend or to denigrate/attack a particular telenovela product, network, artist, and so on. These users merit close attention. If you follow them through time, their agenda eventually surfaces.¹⁰ And these agendas are great pointers to the strong competitive economic undercurrents present in the telenovela world.

After a couple of weeks of observing the boards included in my study, I am usually familiar with the most active participants, their styles, and the different roles they play: moderators, leaders, industry informants, cheerleaders, critics, hecklers, and snipers. Many participants hide behind their “nick” and never identify themselves. Others reveal their true identity at some point or when I approach them via the option of a direct message.¹¹ All of them create an online persona with distinct characteristics, which incorporate varying degrees of fandom for the telenovela genre, for a particular telenovela, for an actor, or – most common in the Venezuelan boards – for one of the two major telenovela producers: RCTV or Venevisión. When the latter is the object, network fandom is akin to partisanship. In extreme cases it is similar to sports hooliganism.

I usually participate very little in these message boards. I post a message or two, explaining that I am a Venezuelan scholar who studies telenovelas and that, as part of my research, I will be reading their posts. I also provide my email address and offer to answer any questions they might have about my study or about myself. Moderators usually email me a welcome. On rare occasions I receive correspondence from other board members. My decision to be a non-participant observer is due to my fear of getting tangled in one of those arguments in which one is not sure of the intentions and agendas behind the discussing “nicks.” For years I have wrestled with the impossibility of crossing the swampy terrain of message boards without getting soiled. Simply put, there are too many virtual agendas that are at play. And it is safer to observe and take fieldnotes without forgetting that anyone can hide behind a “nick.”

There are key occasions for message board observation that help to understand the reception process. For example, during the broadcast of a telenovela’s first and final episodes, I keep an eye on the reactions and comments of these virtual communities as they watch my object of study. There are some enlightening in-depth discussions that illustrate the parameters and factors that the audience considers when choosing a particular telenovela.

At the same time, contradiction and speculation can also reign in message boards. Frequently arguments generate more heat than light. It is particularly interesting to observe the board behavior of some users who also participate in my study via

interviews, chats, and email questionnaires. Often their online persona is completely different from the individual whom I meet face to face in Venezuela. Many times their opinions on the message board follow one of the board's opinion leaders and/or the partisan position of their own constructed online persona, and they are different from the ones they express in my study. This, of course, begs two questions: Who is the real person? And what are his/her real perceptions and opinions? Notwithstanding inconsistencies, hidden agendas, and role playing, the observation and understanding of message boards is essential for my research, because these inflection points help me deepen my knowledge about telenovelas. It is in these contradictions that the paradoxes inherent to this genre thrive and some of the questions that need to be answered hide.

It was the most surreal experience of my life. The bookstore was packed with people. I had already given two short interviews that would appear later on national television. "*Hola*, thanks for coming! What's your name?" I asked each person who was standing in the long line in front of the table where I sat signing copies of my book *Venezuela es una telenovela*.

I was in Caracas, and this was my book's official presentation. I kept observing myself as I played the unusual role of being the center of attention, and signed copy after copy.

"*Hola*, thanks for coming! What's your name?" I asked the twenty-something man who was standing in front of me as he smiled warmly and handed me his copy of my book.

"My name is Luis, but you might know me as 'telenoveler' from the TVVI message board," he said.

I looked at him intently. I knew exactly who he was in the Internet. However, I had always pictured him as older, with a mean demeanor and a harsh tone of voice. This guy seemed pretty nice. I shook his hand.

"Can I have a picture with you?" he requested.

"Sure," I said. "Now, *this* is extremely surreal," I thought, as I smiled to the camera.

The woman who took the picture introduced herself:

"*Hola*, I also participate in TVVI. I'm "marina10," but my real name is Mirna. It's very nice to meet you, *doctora*."

Luis and Mirna explained that they had just met in person for the first time here at the event, and that there were two more TVVI participants standing further back in the line: "justo" and "fanaticonumero1." An hour later, when I had finally signed all the books, I sat with the four of them. Only Mirna lived in Caracas. The three men had travelled to the capital with the express purpose of attending the presentation of my book. We talked about how they had finally met in person that night, and they joked about some of their attitudes and posts in the board. We took more pictures. Two days later I saw the photographs and read their posts about the book event and me in the TVVI message board. Suddenly

the line that separates the virtual realm of computer mediated communication and what we call reality had blurred. The TVVI community was now more “real,” whereas I had become a bit virtual.

The Newest Borough: Social Media

What does the contemporary self want? The camera has created a culture of celebrity; the computer is creating a culture of connectivity. As the two technologies converge – broadband tipping the Web from text to image, social-networking sites spreading the mesh of interconnection ever wider – the two cultures betray a common impulse. Celebrity and connectivity are both ways of becoming known. This is what the contemporary self wants. It wants to be recognized, wants to be connected: It wants to be visible. If not to the millions, on Survivor or Oprah, then to the hundreds, on Twitter or Facebook. This is the quality that validates us, this is how we become real to ourselves – by being seen by others.

(Deresiewicz, 2009)

Facebook

A social media network “can be defined as an individual web page which enables online, human-relationship building by collecting useful information and sharing it with specific or unspecific people” (Kwon & Wen, 2010). In other words, social media are online places where people share, network, and communicate. In addition, these sites encourage feedback such as voting, comments, and favorites. (An example of this characteristic is Facebook’s “I like” feature.) Social media usage has grown exponentially in the last five years. According to the Nielsen Company, people spend more time on blogs and social networks than on other online destinations. Globally, Facebook was the most popular social network site in December 2009, when it had 206.9 million unique visitors (Ehrlich, 2010).

In 2008, when I designed my study of *La vida entera*, I was already aware of the massive presence of telenovela groups and fan pages on Facebook. Some were set up and administered by the telenovela’s producing network/company, while fans created other groups. Hence I decided to set up a group for *La vida entera* where fans could exchange opinions, post pictures, and generally exercise their fandom. This was a different experience from monitoring the message boards. First, most group members watched *La vida entera*, as opposed to the behavior of message board participants, who sometimes commented even if they had not watched the show. Second, the use of pseudonyms is rare in Facebook.¹² Third, I played an active role as I posted topics on the group’s discussion board.

Membership in the group reached 625 by the telenovela’s final episode.¹³ Group participants used the “wall” extensively to express spontaneous opinions. During the six months when the telenovela was on the air, I posted 24 topics on the discussion board, which elicited spirited exchanges. These topics were inspired by my study’s

research questions and by developments in the storylines. In addition, group members posted 16 discussion topics, and also web links and photographs related to *La vida entera*. Some members created a spinoff group dedicated to actor Luis Gerónimo Abreu, who played “Guille.” This character’s love story with “Tata” eclipsed the protagonists and became the public’s favorite.

Once again, I witnessed the links between consumption and production. User-generated content from this Facebook group often came up in the production side of my research. Author Leonardo Padrón read carefully the musings of group participants, and actors working in *La vida entera* occasionally wrote on the group’s wall and replied to the public’s comments.

Video Blogs and Chats

“This video has content from Venevisión International, which has blocked it in your country on copyright grounds.” The message appeared every time someone outside Venezuela tried to watch *La vida entera*’s episodes uploaded on YouTube and other video sharing sites. The warning was displayed even on videos uploaded by the network for promotional purposes. Venevisión executives told me that the rationale for this was to increase the international sales of the telenovela. This international block disgusted viewers around the world who had watched previous telenovelas written by Leonardo Padrón, admired many actors in *La vida entera*’s stellar cast, and were used to watching telenovelas online.¹⁴

Soon there was an alternative: full episodes were embedded in a blog. The news traveled fast along the telenovela grapevine, via individual emails and chats. At the same time, fans protected the site. I could not find any posts on message boards or social media that included the actual address of the blog. As one audience member told me, “we must keep the secret so Venevisión never finds it.” Before long, people were watching and writing so many comments on the blog that the author/owner (who used a pseudonym) decided to embed a chat on the site where some of *La vida entera*’s hardcore fans met regularly to talk about their telenovela. Every day, at the time when it was 9 p.m. in Venezuela, a group gathered virtually to chat about the episode being broadcast. Participants who were watching live in Venezuela would do a “play by play” of the telenovela for those living abroad, who eagerly “listened.” During commercial breaks and at the end of the episode, the chat’s activity intensified significantly. I observed this nightly ritual with fascination. Many chat participants lived in Europe and stayed up until after midnight in order to participate in the conversation. The next day they would write about how tired they were for lack of sleep. But they rarely missed the chat. Two months after *La vida entera* had ended, there were still occasional chats on the blog. The conversation usually centered on how much they missed the telenovela and on “Guille” and “Tata,” their two favorite characters.

I contacted the blog owner the moment I heard about the site. We emailed periodically and he kept me informed about his decision process regarding the

content of the chat. When *La vida entera* entered its final month, he offered to place a recruitment announcement for my study on the blog. I wrote the notice and he placed it prominently, at the top of the main page. Thanks to the announcement, I was able to interview, via Skype and email, 32 audience members who did not live in Venezuela and watched the telenovela on the blog. These one-time interviews at the end of the telenovela rounded off my study and provided remarkable material, which supplemented the evidence gathered from viewers who watched in Venezuela. I also interviewed, in Caracas, three of the chat participants who delivered each episode's "play by play." In sum, the video blog and the chat became important research sites for my study. They represented yet another place where telenovela consumption revealed its addictive, determined, and transnational qualities.

I woke up to another sunny morning in Caracas. I had planned this one carefully. At 9 a.m. I would interview Adriana. At 11.30 a.m. it would be Graciela's turn. Both women had emailed me, responding to my announcement in the blog. I set up both interviews over the phone. Adriana immediately told me who she was in the chat: "mimo." Graciela only mentioned her blog video consumption.

Even though each conversation should take about an hour, I never schedule interviews at only one hour distance from each other because of the city's traffic and the culture's general lack of punctuality: I try to avoid at all costs making my participants wait. If someone must wait, that should always be me.

I arrived at the bakery at 8.30 a.m., with enough time to have breakfast. Adriana arrived only a few minutes after 9. However, the interview was much longer than I expected. Her answers were lengthy and detailed. Surprisingly, Graciela arrived at 10:30, when I was wrapping up Adriana's interview. I introduced them: "Hola Graciela, this is Adriana. I'm about to finish my conversation with her, and I'll be ready to talk with you. Meanwhile, can I get you a cup of coffee and a pastry?" Graciela and Adriana shook hands. Adriana asked: "Do you participate in the chat, Graciela?" "Yes, every night," answered Graciela with a broad smile, "I'm 'ggrr,' and you?" "I'm 'mimo,' replied Adriana. Next thing they were laughing and hugging each other, delighted to finally meet face to face. [. . .]

Victoria also participated regularly in the chat. I interviewed her one afternoon at the coffee shop of an arts complex she wanted to visit. When our conversation was almost over, Victoria showed me some cartoons she had drawn of her favorite characters in *La vida entera*. The level of detail in her work fascinated me. Also, there was so much excitement in her voice as she explained each element she had included in her drawings! She promised she would email me all the cartoons. I was surprised to see that one of her drawings was titled "Carolina." It was Victoria's depiction of me studying telenovelas. Right there I realized, more than ever before, that researchers, too, are produced, represented, and consumed. I am also a character in my journey.

Looking Back and Looking Forward

Scholars frequently report having difficulties in recruiting participants for their studies. I have not encountered these hurdles. Telenovelas are consumed massively and there is no shortage of potential study participants. In addition, audience members are usually eager to share their experiences and opinions. They enjoy talking about these shows' characters and plots. At the end of each case study, many report that their participation gave them a feeling of validation about their telenovela consumption habit. This foregrounds one of the many paradoxes inherent to this television genre: it is simultaneously (and massively) consumed and derided. And that contradiction marks everything and everyone related to telenovelas – viewers, writers, actors, regulators, and the scholars who study them.

Geographic distance is the main source of many of the challenges that I face in my research and the trigger for the methodological solutions I strive to find, aided as I am by technology and new developments in telecommunications. The mix of being culturally close to, yet geographically far from, Venezuela exacerbates the

insider/outsider tension that is part and parcel of ethnographic studies (Murphy, 1999; Parameswaran, 2001). I occupy the subject position of outsider when I research production. Even after a decade of investigating telenovela production in Venezuela, and despite the continuous warm welcome I receive in television studios, dressing rooms, and writers' homes and offices, I know I am an outsider. I do not work in the telenovela industry. In contrast, I do not feel as an outsider when I study the audience because I watch telenovelas. And, although years of research have left their mark on my consumption process, I still think of myself as an audience member, and that links me to my reception participants regardless of other demographic and cultural markers where our identities do not intersect.

The insider/outsider tension points to the key role that identity plays in academic research. Identity is an undeniable factor in the topics we choose to study and in the epistemological and ontological assumptions and commitments that underpin our scholarship. But it is also a fundamental concept for the examination of telenovela audiences where identities are not only constructed in the telenovela text, but also produced, consumed, and regulated within the specific cultures that impregnate the sites where I have studied telenovela reception. This is most patent in my face-to-face exchanges with study informants who also participate in message boards or social media. It is a facet of my journey that needs to be further studied and analyzed.

The comprehensive nature of my case studies challenges me as much as the geographic gap does. Attempting to study telenovelas using a multiperspective model like the circuit of culture is not for the faint of heart. It requires particular stamina and creativity, because it is akin to running on a parallel course to a strange Olympic event: a relay obstacle race. As I run, I can see up close how the runners pass the baton to each other. I watch how ideas and talent become a script, and how hard work and more talent transform the script into televised installments. I observe how audience members interpret what they watch and make it part of their everyday life, and how the entertainment press reports and speculates about the production and consumption of the audiovisual text. I witness the way the audience's readings become factors in the writing and staging of the story. And I can detail the kinds of hurdles that make up the race's course – professional, personal, commercial, expected, imposed, or unanticipated obstacles. This is a difficult, complex, long race, which requires both speed and endurance. This race also provides evidence characterized by depth, texture, and complexity: it never simplifies my object of study for the purpose of our investigation, and it underscores the links among media, culture, and society.

My journey is not finished. The theoretical articulations of the different moments of the circuit of culture demand more research. The changing, paradoxical, and unpredictable nature of the telenovela world requires more studying. And my country also calls for continuous research. Venezuelan television and telenovelas are changing as the country transforms. Political polarization keeps growing, and the Chávez government is gradually diminishing the freedom of expression through media content laws and through the closing of opposition media outlets. The chilling

effect of these measures is already obvious. And the impact on international sales of Venezuelan telenovelas is undeniable. Therefore it is not the time to stop. On the contrary, as both the industry and its context change, I must continue to examine how and why telenovela addiction works. Hence I face new itineraries. There are more destinies and audience hot spots that require my presence, and more packing lists that need to be planned for. I still have a lot of walking, talking, and observing to do as I traverse the beguiling landscape of telenovelas in search for their addictive soul.

Itinerary in progress: La mujer perfecta (120 episodes?)

- *Possible destinations:* the end of Venezuelan telenovelas? The first telenovela protagonist with autism. The first telenovela with Twitter: @lamujerperfecta
- *Packing list:* in-depth interviews (in person or via Skype), focus groups, participant observation, questionnaires via email, observation of message boards, analysis of daily ratings and share, chats via Blackberry, participant observation on Twitter
- *Travelogue:* to be determined

NOTES

- 1 There are wonderful books that give fandom the in-depth treatment it deserves. I recommend particularly Jenkins (1992), Hills (2002) and Gray, Sandvoss, and Harrington (2007).
- 2 Some of the authors who have written about the ethics, procedures, and conundrums of doing online ethnographies are Bird (2003), Sade-Beck (2004), Markham (2008), and Driscoll and Gregg (2010).
- 3 *Machismo* is a set of beliefs that include the idea that men are superior to women, have more extensive rights, and belong to the public sphere, while women should stay in man's shadow and in the private realm. According to *marianismo*, women are morally superior, they are the owners of spiritual strength and they have a capacity for self-sacrifice that makes them particularly fit to be good mothers. The combination of these two ideologies places women in the private sphere of the household and makes them take the brunt of parental responsibility.
- 4 According to Research in Motion (Blackberry's manufacturer), Venezuela outpaces Europe in per capita use of smartphones (Cancel, 2009).
- 5 Families that have participated in my studies range from three to eight members. The structure of these groups varies from traditional – mother, father, and children of different ages – to nontraditional combinations. The latter include, but are not limited to, grandmother and grandchildren, grandfather, mother, children and aunt, and mother, children and mother's partner.
- 6 All the vignettes in the chapter were written on the basis of my unpublished expanded fieldnotes.
- 7 Participants who belong to lower socioeconomic strata have Internet access thanks to the widespread presence of Internet cafés in their neighborhoods.

- 8 Because telenovelas are a spectacle of emotions, their consumption tends to be very emotional. Participants in my studies tend to rationalize more their reception of the shows, which moderates the emotional aspects of their consumption.
- 9 The entertainment press lurks in message boards. Through the years I have seen repeatedly how a post becomes “news,” even when it was completely untrue. This is the main reason why some use message boards to advance their own agendas.
- 10 Often, in time, even their true identity becomes obvious.
- 11 Most message boards have the option of contacting other registered users directly, via their “nick” (their email address is not shown). This type of communication is private and does not appear on the message board. I approach some users this way to ask them if they would be willing to have a conversation with me about the telenovela I am studying. About 30% of those contacted agree to meet me in person or via Skype.
- 12 The absence of pseudonyms does not imply that each user does not construct a Facebook persona. We all do when we choose what to include in our profile and what to post on our wall and our friends’ walls.
- 13 After I created the group, two Facebook fan pages were created. One had 98 fans and the other over 1,600. Both pages had almost no activity.
- 14 In addition to discouraging the public’s good will toward the network, blocking the videos did not seem to help international sales either, which is a topic that is beyond the scope of this chapter. The jury is still out on whether blocking content encourages or discourages international sales of specific telenovelas.

The Reflexive Self

The Expressive Subject in Makeover Television and Audience Research

Katherine Sender

ABSTRACT

Drawing from a large audience research project conducted by a team of researchers at the University of Pennsylvania, I consider how the methodological challenges of doing audience research can inform a broader investigation of the production of a reflexive self. Looking at responses to four US makeover reality shows, our data suggest that neither of the two main perspectives that dominate reality TV research, the uses and gratifications approach and the governmentality critique, fully account for the meanings the viewers we talked to brought to makeover texts. They acknowledged learning some things from these shows, while pointing to big differences between the shows. Yet producing themselves as disciplined citizens appears far less significant than their investments in the possibilities of self-transformation: specifically, transforming the self's relation to the self. Makeover shows facilitate an articulation of a particular kind of self, which has insight into itself, has agency about itself, and that cares for itself. Yet this reflexive self is also produced through the research process, where implicit hierarchies of value concerning expressivity and self-reflection are paralleled, even reinforced, by the apparently diverse routines of low-brow makeover television and high-brow academic research.

The capacity to reflect tends to be seen, first, as a distinctly modern phenomenon and, second, as something fundamentally good.¹ Given the emphasis, in reality television and in makeover shows in particular, on the production and performance of the self, audience research in this area seems an ideal place to consider what we mean by reflexivity, how this is shaped, and what its values and limits might be. Makeover shows encourage viewers to see themselves as if from the outside and to consider their lives within overarching narratives of transformation, meanwhile promising that consumption is the answer to the question of the self. As part of a larger genre of reality television, makeover shows present audiences with glimpses of their production processes, allowing a reflexive distance in the construction of reality. Other media technologies, especially online, provide access to communities of critics who weigh in on the shows' production routines. Makeover shows and their reception epitomize shifts toward increasingly reflexive modes of mediated engagement, which deserve analysis. Further, investigation into reflexivity makes its own reflexive demands. What role might audience research play in reproducing assumptions about the cultural value of reflexivity? This chapter draws on data gathered for a large audience research study of viewers of US makeover shows (Sender, in press). I consider here the extent to which audiences of makeover television shows can be seen as reflexive about their engagement with the shows, the manner in which audiences draw on makeover narratives to produce a reflexive self, and the manner in which reflexivity might be a product of the research process itself.

Anthony Giddens (1991) sees the modern identity as inherently self-reflexive. In contrast to the pre-modern self, constrained as it was by role and structural position, the modern self "has to be reflexively made [. . .] amid a puzzling diversity of options and possibilities" (p. 3). The flexible capitalism that characterizes the late twentieth and early twenty-first centuries has manifested in part through diversifying media technologies and genres. These mediated forms offer unprecedented opportunities for self-representation and demand reflexive attention to the idea of self-presentation and assembly. Makeover television's *raison d'être* is to help people navigate through the puzzling diversity of possibilities that this new media landscape offers: What to wear? How to eat? Who to be? Makeover television is paradigmatically self-reflexive in Giddens' terms: its narratives and modes of representation posit identity, the body, affect, and behavior as intensely involving projects of the self; the genre narrates that self as one having a (traumatic) past and an (idealized) future in a journey of self-discovery; the project of the makeover involves constant self-scrutiny and revision; its stories reproduce and rework other narrativized and mediated modes of self-production, borrowing from what Rose (1999) calls the "psy disciplines," as well as from women's magazines, talk shows, and self-help literature (see for example Gamson, 1998; Woodstock, 2002; Grindstaff, 2002; McGee, 2005). Finally and most seductively, makeover television shares the modern romantic idea that only through self-reflexivity can subjects find their authentic, inner being – a self capable of being "true to oneself" (Giddens, 1991, p. 78).

Giddens and others argue that reflexivity allows agency and choice, thereby granting individuals greater personal freedom. Ulrich Beck, for example, argues that reflexivity promotes autonomy from social structures and hierarchies: "The more societies are modernized, the more agents (subjects) acquire the ability to reflect on the social conditions of their existence and to change them accordingly" (Beck, Giddens, & Lash, 1994, p. 174). Reflexivity produces agency and allows for "detraditionalization" – that is, for freeing oneself from structural forms of determinations, norms, and expectations. Both Giddens and Beck hold an optimistic view of reflexive modernism, seeing the increasing autonomy that reflexivity affords as a way for subjects to contemplate and critique the social and economic conditions of modernity. It is precisely the freedom to be in control of one's own image and destiny that makes the fantasy of the makeover so appealing.

This freedom that reflexivity seems to offer has proven especially important for scholars interested in media reception – both as a way to resist some of the top-down models of media effects and as a way to engage with audiences' perceptions of texts. John Corner (2009) argues that reality television draws from two contradictory traditions in documentary film: the reflexive style that acknowledges the production process within the film itself; and the observational, "fly-on-the-wall" style of shooting and editing. "Much reality television [. . .] mix[es] moments of self-conscious and playful artifice with moments of intensive commitment to the truthfulness of their images, the 'reality claims' of which at least equal the much-discussed 'ideology of transparency' of classic observational work" (p. 62). For Corner, the friction between the fantasy of the window on the world and the revelation of the window frame itself precipitates some degree of reflexivity in audiences. As in other reality genres, makeover show production conventions encourage a reflexive position by showing candidates talking directly to the camera and by offering glimpses of production equipment such as microphones and cameras.

In her large audience research project, Annette Hill (2007) also argues that contradictions within reality television promote reflexivity in its audiences. She suggests that reality television's uneasy location between transparency and artifice demands that viewers reflect on its truth claims: "The intermediate space of [reality television] can be transformative, and at times we will personally connect with something in a programme, reflecting on what that person or real event means to us, creating a powerful self-reflexive space" (p. 110). For Hill, media reflexivity is an outcome of reality television's precarious position at the interstices of fact and fiction. She calls her respondents' skepticism about reality television a "chain of distrust" (p. 140) and appreciates that viewers are critically more engaged with the truth claims of reality television than with those of news programs and documentaries, where she would like to see more reflexivity. Although both Corner and Hill are ambivalent about the virtues of reality television, this genre's frank acknowledgement of its production processes might be one of its more progressive aspects, offering audiences space to reflect on its claims to represent the real world.

Reflexivity also has a long tradition in social science research and writing (see for example Van Maanen, 1988 on reflexive writing, and Hammersley & Atkinson, 1995

for an overview). Pierre Bourdieu (in Bourdieu & Wacquant, 1992) has advocated “epistemic reflexivity” (p. 36), through which sociology “continually turns back onto itself the scientific weapons it produces” (p. 214). This is consistent with Bourdieu’s analysis of habitus and field; within the field of intellectual inquiry, the scholar must rigorously investigate her own habitus and the routines of thought that shape her production of knowledge. Loïc Wacquant describes this approach: “What has to be constantly scrutinized and *neutralized, in the very act of construction of the object*, is the collective scientific unconscious embedded in theories, problems, and (especially national) categories of scholarly judgment” (p. 40). For Bourdieu and Wacquant, this means that researchers must pay attention not only to their social position (gender, class, etc.), but also to the investments and limits of their intellectual field – indeed to the assumptions that underpin the intellectual enterprise itself, which radically separates the thinking from the object of thought. “The subject of reflexivity must ultimately be the social scientific field *in toto*” (ibid.).

Importantly, for Bourdieu reflexivity must be a social commitment, not an individual one, and he derides what he considers to be a US fashion in the social sciences, taking it for a narcissistic, solipsistic focus on feelings and textuality. Nor does Bourdieu have much patience for the radically relativistic position taken by some reflexive social scientists, which he sees as undermining the intellectual project. For Bourdieu, a socially embedded reflexivity

compels us to repudiate the absolutist claims of classical objectivity, but without for all that being forced into the arms of relativism; for the conditions of possibility of the scientific “subject” and of the scientific object are one and the same. (Bourdieu & Wacquant, 1992, p. 214)

The challenge, in reflexive sociology, is to consider collectively these conditions of possibility. Like the other kinds of reflexivity noted above – self-reflexivity and media reflexivity – epistemic reflexivity is, for Bourdieu, a kind of freedom, in this case one that offers “the means of a potentially liberating awakening of consciousness” (p. 215). Bourdieu’s rather pessimistic view of social change is leavened by an optimism of method.

Given the different foci of these three types of reflexivity – of the self, of media, of method – does it make sense to consider them together? For Giddens, reflexivity means being able to reflect upon one’s life and history and to construct a coherent (if changing) narrative about the self. For Beck, reflexivity means being able to consider, and possibly detach oneself from, the limits posed by one’s class and gender. For Corner and Hill, reflexivity involves assessing generic conventions and aesthetics in order to critique their truth claims. For Bourdieu and others with methodological concerns, reflexivity is fundamental to the researchers’ responsibility to consider our own habitus and investments in shaping the assumptions and techniques of research. As a preliminary attempt to articulate what might be the overarching features of reflexivity, I suggest that there are three key attributes that link these perspectives: to

be able to see a phenomenon (the self, social structures, a text, a method) in its context; to be able to consider the possible influences this context has on the phenomenon; and to be attentive to processes and not only to outcomes, because phenomena are always contingently situated in time and space. Further, all three perspectives hold that reflexivity affords freedom from tradition, from ideology, from a partial world view.

How might the idea of reflexivity be useful in understanding some of the ways in which people discuss makeover television? Conversely, in what ways can audience research help clarify what we mean when we talk about reflexivity? In what ways can reflexivity be seen as a valuable attribute or perspective, and what might be the limits of this value? After an overview of the methods used in this audience research, I go on to discuss examples of reflexivity within the three frames outlined above: self-reflexivity, where respondents used makeover shows to imagine themselves from the outside; media reflexivity, where they discussed elements of the shows they believed were constructed and/or manipulated; and research reflexivity, where interviewees commented on their participation in the research process itself. I conclude the chapter by considering the extent to which these examples of reflexivity are an attribute of audience engagement with texts and what, by contrast, may be a classed and gendered performance of reflexivity demanded by the research context.

Methods for Audience Research

After an earlier textual analysis of *Queer Eye* (Sender, 2006) I became frustrated with my own and others' rather top-heavy critique of makeover shows and with the assumptions that this approach allowed about the influence of such shows on everyday life. There is a rich history of audience analyses, especially feminist, of traditionally women's genres (see for example Radway, 1984; Ang, 1985; Press, 1991; Bird, 2003), which seemed to have been forgotten in the rush to make sense of the new (and not so new) contours of reality television. I was especially interested in makeover shows because of their expressly pedagogic approach to the self and its transformations: what did audiences make of these exhortations to change? Did they laugh and point at the unfortunate candidates on the screens, or did they obligingly adopt the consumer instruction that saturates the texts – or both? How might asking the audience what these shows mean to them complicate most critics' assumptions of audience effects?

Between fall 2005 and spring 2007 a team of researchers at the University of Pennsylvania and I conducted extensive audience research on four US makeover shows: *The Biggest Loser*, where 14 contestants compete to lose most weight; *Queer Eye*, where five gay men give a makeover to a hapless heterosexual guy; *Starting Over*, which features six women living together to get their lives in order; and *What Not to Wear*, in which women are transformed from frumps and floozies into models of

respectable upward mobility.² Rather than getting an impression of people's responses to reality television broadly, as Hill (2005) had done, or even of responses to lifestyle reality shows in general, as Skeggs and her colleagues did (Skeggs, Thumim, & Wood, 2008; Wood, Skeggs, & Thumim, 2008), I was interested in responses to shows that privileged certain types of makeover narratives: weight loss, image makeovers, televised psychological interventions, and male makeovers. I chose these four shows because each epitomized one of these narratives (although they often combined more than one type), because they had the highest ratings in their type of makeover shows, and because they featured non-actors.

There were three phases in the audience research: conducting four online surveys, one for each show (fall 2005 to spring 2006); doing interviews with regular viewers recruited from that survey (spring and summer 2006); and doing interviews with a comparison group that was neither recruited online nor made up of regular viewers of the shows (fall 2006 to spring 2007). For each show, I selected every episode produced in the space of two seasons (2005–2006) and I coded it for candidate and host characteristics, definitions of the candidate's problem, nature of the makeover, type of instruction, amount and type of product placement, and so on. I also analyzed the press coverage of these and other makeover shows, intending to look at popular discourses about them.

The Survey

The survey was designed to investigate some of the key themes that had emerged from existing textual and audience approaches to reality television and to makeover shows in particular: what viewers liked and didn't like about the show; whether they picked up tips and passed them onto others, and to whom; whether they identified with the shows' candidates and hosts; what other shows they watched and what sense they made of these. We also asked for basic demographic data (gender, age, education level, occupation, and so on) as well as for data about viewing habits – in relation to the show in question and to makeover viewing more generally.

We posted requests for participants on a variety of reality-show themed websites. Some were message boards specific to the shows; others were blogs about reality television in general. We assured participants that their information would be kept confidential. We received 1861 completed survey responses: 464 for *The Biggest Loser*, 230 for *Queer Eye*, 544 for *Starting Over*, and 623 for *What Not to Wear*. Women outnumbered men in responding to all four surveys; the largest percentage of women was for *Starting Over* (95%) and the smallest for *Queer Eye* (75%). White respondents made up almost 90% of the survey participants; with around 6% African Americans, 2% Asians, and 2% reporting "other" or "mixed race." Fewer than 4% identified themselves as Latino/a. Almost 90% of the *Biggest Loser*, *Starting Over*, and *What Not to Wear* respondents identified themselves as heterosexual, compared with 72% of the *Queer Eye* respondents. The modal age group for respondents to all four surveys

was 30–39; *The Biggest Loser* and *What Not to Wear* skewed slightly younger than *Queer Eye* and *Starting Over*. Just under two thirds of the respondents to each show were married, in a civil union, or living with a partner; around a third were single. Almost 40% of all the respondents had a Bachelor of Arts (BA) degree. Because of the limited availability of Nielsen data, it is hard to estimate how like the “actual” (i.e., Nielsen-rated) audience our respondents were. A comparison with the general population shows that our survey respondents were in general likely to be white women aged between 20 and 40, with an education above the average level.

Once we collected the surveys, two graduate students and I designed a coding scheme for all the open-ended responses, looking at such things as the extent to which respondents valued the instructional aspects of the shows, how much they picked up tips and what kinds of things they had used in their lives, whether they had passed on tips to others, how they critiqued the experts’ instruction, and what their perceptions were of the commercial appeals embedded in the shows. The survey responses were co-coded by at least two of us and were checked for intercoder reliability, which exceeded the acceptable minimum degree of agreement of 0.7 in almost all cases.

Interviews

We contacted all the survey respondents who had indicated that they were willing to talk to us about the shows and about their own viewing habits, and we interviewed 110 in this group: 24 on *The Biggest Loser*, 22 on *Queer Eye*, 37 on *Starting Over*, 22 on *What Not to Wear*, and 5 on multiple shows (where respondents had completed more than one survey). The gender, race, education, sexuality, and relationship profiles of the interviewee group were very similar to those of the survey.

All the interviews were set up via email and conducted on the telephone. Some researchers have used more ethnographic techniques to investigate viewers’ immediate reactions to scenes in reality television shows; such was Helen Wood’s “text-in-action” approach (Skeggs et al., 2008). Others have employed participant observation in order to understand how people interact with media in their homes and in public places (see for example Seiter, 1999; McCarthy, 2001; Hoover, Clark, & Alters, 2004; Hoover, 2006). While being similarly committed to an “ethnographic way of seeing,” in which researchers try to “get close to those studied as a way of understanding what their experiences and activities *mean to them*” (Bird, 2003, p. 8, quoting Emerson, Fretz, and Shaw, 1995, p. 12), telephone interviews have the advantage of efficiently gathering interview data from a large group of people distributed over a wide geographical region. Further, I was less interested in viewers’ immediate reactions to the textual features of the shows or to the general use of media in everyday life than in collecting a range of narratives about how people interpret the place and meanings of makeover shows.

All interviewees were given pseudonyms, and their audiofiles were transcribed. These were imported into NVivo ethnographic coding software and coded for the

themes that had emerged both in the survey and in the interviews: references to transformation, instruction, the inner and the outer self, emotion (the candidates' as well as their own), realness, identification, engagement with the commercial appeal of the shows, activities while watching the shows, and so on.

Comparison Group Interviews

Our survey and interview recruitment strategies oversampled people who had access to the Internet and to email and who consumed (and in some cases produced) online content about reality television. These methods were therefore likely to overemphasize the views of people who were well educated, employed, and affluent, on one hand, and who were highly engaged in and informed about reality television, on the other. As a point of comparison, we interviewed 20 people who were recruited through local advertising and temp agencies and were not regular viewers of the shows.³ Participants in this group were paid for their time. Their demographic information reflects much more closely than our group of regular viewers the gender, race, and education profile of the US, although they tended to be younger than the national average.

The group of 20 was divided into four sets. Five participants in each set watched individually an episode of one of the four shows and then answered questions similar to those of the regular viewer group. Unlike the telephone interviews, these comparison interviews tended to be both much shorter – ranging from 15 minutes to just over half an hour – and more diverse in their responses. The length might be accounted for by the media laboratory setting for the interview and by the unfamiliarity these interviewees had with the shows: they only had the one example to draw on in their responses, even if they had watched other types of makeover shows. Unlike most of the regular viewers we talked to, who generally expressed positive views about the shows even if they had some criticisms, some comparison group interviewees expressed strong skepticism, cynicism, and hostility to the show they watched for the study. Others, however, said that they enjoyed watching it, so much so that they would start to watch it at home – an inadvertent form of promotion for the shows that I hadn't anticipated! Like the regular viewer interviews, these were transcribed, imported into NVivo, and coded according to the same coding structure. Even though the comparison group data are somewhat scarce and were gathered in rather artificial circumstances, they nonetheless offer some insight into what people who don't participate in online forums about the shows and who aren't familiar with the shows might make of them.

To summarize, the data for this reception project consisted of textual analyses of the four shows and press coverage of them and of makeover television in general, survey responses from more than 1800 people, in-depth phone interviews with 110 people, and comparison group interviews with 20 people. The survey provided us with a large amount of relatively anonymous data, which we used for broad assessments of

the uses and meanings of the shows and mined for themes to explore in subsequent interviews. The interviews with regular viewers were open and exploratory and they drew on interviewees' often deep knowledge of the shows and of their genre. The comparison group interviewees were more like the population as a whole: they were not already fans of the shows, and therefore they were likely to reflect a rather casual viewer's impression of the genre. Triangulating between textual data and different kinds of interpersonal data demonstrates that highly engaged viewers reflect upon makeover narratives in describing their relationships with themselves, their social worlds, their media engagements, and the research process.

Three Modes of Reflexivity: Self, Media, and Research

Unsurprisingly, these combined methods yielded a great deal of data about people's sense of makeover shows and of their relevance to their own lives. I explore these themes more thoroughly elsewhere (Sender, in press). Here I focus on the ways in which the viewers we talked to engaged reflexively with the shows. If reflexivity is the ability to see a phenomenon in a contingent and reciprocal relationship with its context, in what ways can both the regular viewers and the comparison group viewers be said to take a reflexive approach in their discussions of the shows? What might reflexivity among our respondents suggest about audience research and its usefulness in assessing the cultural significance of media forms? Three types of reflexivity permeated discussions with the audiences: self-reflexivity, media reflexivity, and research reflexivity.

Self-Reflexivity

Regular viewers frequently made reflexive statements about how the shows encouraged them to see themselves in the broader context of their lives through the mediated frame of the candidates' experiences. This process was captured more powerfully, because viewers saw the candidates as real people with whom they often identified, and strongly so. One example came from Casey, a *Biggest Loser* woman viewer, who said:

Even by watching the show, it can help you realize changes that you need to make for yourself. Not only are they talking to the people on the show, but they're also talking to the audience that's watching the show. And you realize, "Oh, if I am overweight, then I could have problems with this down the line."

The increasing possibility that ordinary individuals' lives may appear in public and mediatized forms intensifies self-reflexivity. Rachel's husband and home were the

object of a makeover in *Queer Eye*. She described how, as a result of the production and airing of the episode in which they appeared, she was more likely to make long-term changes in their lives. In the interview Rachel discussed what she thought was most effective about the experience:

The reality of seeing yourself on television, I think. Because, you know, people go to counseling, people go to Weight Watchers, all that kind of stuff, and it's not until you actually see yourself on TV that you go, "Oh, I really have to do this." And you realize that other people besides your immediate family are seeing whatever the situation is.

Rachel's reflections on the self and on interpreting her personal circumstances through a mediated gaze were not unique to her, but they were imaginable for viewers who hadn't been on the show. Gareth Palmer (2004) argues that "to be filmed by cameras is suddenly to share the look of the other, to objectify yourself from a vantage point in which this look is inscribed within the seemingly 'objective' gaze of the surveillance footage" (p. 183). Participants frequently described how the shows and the hosts encouraged audiences to adopt the "look of the other" to see themselves as if from the outside. A *What Not to Wear* viewer, Gabby, described other people's posts on an online discussion board: "I've read many people who say that they have Stacy and Clinton in their heads when they're getting dressed or going shopping or whatever." The use of non-actors, the rendering of experience through new technologies, and the genre's claim to authenticity maximize this process whereby viewers put themselves in the candidates' shoes and, after looking at them, turn a similarly appraising eye on themselves.

Giddens (1991) has argued that a fundamental feature of self-reflexivity is the production and revision of narratives that ground identity in a world that no longer permits the fixed, stable sense of place that is supposed to have existed before modernity. "The reflexive project of the self, which consists in the sustaining of coherent, yet continuously revised, biographical narratives, takes place in the context of multiple choice as filtered through abstract systems" (p. 5). As one of these abstract systems, the media offer a confusing array of possible narrative components. At the same time they also suggest that these narratives are particularly suitable to make sense of this array, in what Nick Couldry has termed "the myth of the mediated center" (Couldry, 2003, p. 2). Makeover shows offer narratives structured around the candidates' failures and the need for transformation, and these narratives are taken up, if unevenly, by viewers. They were most common in responses to *Starting Over* – perhaps inevitably, given this program's reliance on psychotherapeutic discursive techniques that call subjects to account for themselves. Peggy, for example, recalled one housemate, Kelly, whom she had particularly identified with:

I understood that Kelly had those issues, and it probably came from her childhood and things that were said to her, how they linger with you. Somebody had said to her that she was being sexually [provocative] with her father, and although that wasn't said to me in that way, my father said he wished I had died when I had cancer. And that has

always been with me my whole life, that one thing you can't just let go. So I understood when she said that was one statement that kind of changed her whole life; that one changed me.

Peggy's story links her own devastating experience of being told something unbearable to Kelly's similar experience; the link here is not the thing told but the significance of their experiences in shaping both their lives. By sharing this experience with her on-screen proxy, Peggy made it possible to reintegrate this statement in a different framework, in which, like Kelly, she was no longer responsible for it.

Even the most compelling narratives of transformation, however, may not offer all respondents the kind of agency and autonomy from the past that the advocates of modern self-reflection might hope for. A *Biggest Loser* viewer, Rebecca, told us her story of a long struggle with weight gain and loss:

When September 11th happened, I was working on the thirteenth floor, and we had 26 flights of steps to go down. I thought I was going to die. And that made me rejoin [Weight Watchers] again, and I lost almost 100 pounds. And I kept it off, I did great. And then little by little, when stress starts coming into my life, I'm eating non-stop again. This is ridiculous! So, even though the stress was there then, I would look at [Biggest Loser candidates] and say, "Wow, look at how great they look!" And then I'd get a bowl of ice cream. I'm like, I don't understand why I would do that.

Although Giddens and others assume that self-narratives are likely to be empowering and freeing, it may be as important that they conform to what Eva Illouz (2003) calls a "culture of suffering" (p. 111), where stories of struggle become the primary means to construct a narrative of the self. On the basis of the paradigmatic figure of Oprah Winfrey, Illouz argues that suffering has become constitutive of modern identity, especially for women.

Stories of suffering are not only the domain of women, however, nor are they articulated only by participants already committed to the self-project of the makeover show. Terrance, a man in the comparison group who had not previously seen *Starting Over*, related to a housemate's financial problems in the episode. He said:

Thank God I'm not who I was. I'm not who I was, but I'm not who I want to be. But I'm moving towards where I want to be. But I mean honestly, I would have been in that same situation [as the housemate] maybe four or five years ago.

Terrance's self-appraisal suggests that makeover show narratives of the self are not unique to the genre but rather draw from broader cultural impulses to tell these kinds of stories. Further, he gives weight to Illouz's (2007) claim that the twentieth century saw an "increased emotional androgynization of men and women" (p. 37). In general, however, we can look at the impulse to produce narratives of the self not as a means toward autonomy from structural constraints such as gender and class, but as a reworking of gender and class norms, in part through changing media and communication technologies.

I don't intend here to undermine these interviewees' uses of narratives in dealing with painful experiences. I do, however, want to consider these uses in terms of Giddens' assumption that narrativization allows a seemingly infinite freedom to invent oneself from arbitrary life events, where "the line of development of the self is *internally referential*" (Giddens, 1991, p. 80). The only criterion is whether it all makes sense in terms of one's own internally generated narrative. However, as Ellen Granberg (2006) argues on the basis of her research on how people who have lost a great deal of weight construct stories about themselves and this process, narratives of the self must be recognizable and credible. They tend to draw on "a stock of 'canonical' narratives" (p. 112) and must be met with at least some acceptance from others, to whom they are told. As Foucault (1978) observes about religious and sexual confession, Rose (1999) about discursive practices within the psy disciplines, and Prosser (1998) about transgender autobiographies, these narratives are embodied and felt, at the same time as being institutionally convenient, even necessary. Far from offering the freedom to invent oneself that Giddens proposes, self-narratives are as likely to deliver the narrator into affective and economic systems that are disconnected from her own interests, however comforting these narratives might feel at a personal level.

Further, commercial communication technologies have been fundamental to the very idea of a "self" that we recognize in the modern era. Some interviewees discussed how they used online sites as an intensified means toward self-reflexivity. *Starting Over* viewer Tori talked about updating her MySpace page daily:

I was doing quotations every day; I do it every couple days now. [I'm] thinking about posting a biography that I'm writing but I'm not sure. I posted the links to it. I post about my struggles – like I have anger issues and panic attack issues . . . I get panicky and then I get angry. I write when I have episodes about that.

Henry Jenkins (2006) is optimistic about the possibilities of convergence and interactivity for audience productivity, where new media technologies offer an unprecedented range of venues, texts, and other resources for self-representation. Mark Andrejevic (2004), however, is suspicious of the role of new interactive technologies as a route to "self-expression and self-knowledge" (p. 97). He is concerned that only by submitting to external and – increasingly – internal monitoring will we come to believe ourselves to be authentic. Andrejevic also warns us that the ideal realm of democratized media, what he calls "participatory interactivity," is too easily co-opted by media companies to extract more labor from engaged audiences, in the form of "productive surveillance" (p. 2). What might seem to us like the freedom to create ourselves can readily be transformed into what Maurizio Lazzarato calls "immaterial labor" (1996). This formula describes activities not normally perceived as "work," but that nevertheless generate profit from ephemeral commodities – information, knowledge, cultural capital. Like other types of capitalization, these profits do not return to those doing the labor.

Giddens sees the ability to be self-reflexive as affording a welcome autonomy from the structural determinants of the past. Audiences' discussions of the makeover

shows suggest that self-reflexivity is mobilized by their viewing practices and that it forms a common and pleasurable mode of engagement with the shows. Self-reflexivity does not represent, however, the freeing from constricting identity categories as promised by optimists of postmodernity; audiences' engagements suggest that reflexivity re-essentializes an authentic inner self that must be expressed. Self-narratives tend to conform to generic expectations that are shaped within the commercial demands of the makeover texts. These programs thus facilitate a self-surveillance that feels like self-awareness, an intimate relation with the self. The extent to which self-reflection is mediated through surveillance technologies and through canonic narratives demands a revision of Giddens' model of a pure, self-referential reflexivity, uncontaminated by economic, technological, and cultural conditions.

Media Reflexivity

The second kind of reflexivity involved the respondents' perceptions of what they saw on screen and how these perceptions were shaped by the economic, technical, and aesthetic contexts in which they were made. First, audiences were highly critical of some of the instruction offered in the shows; they criticized advice from the hosts especially when they saw it as promoting the sponsors' products. *Biggest Loser* interviewees commented on the "shameless plug" of oatmeal and Jell-O dessert: when we asked Seth if he remembered products that were featured on the show, he chanted "Jell-O; Jell-O, Jell-O!" But, even though the regular viewers whom we talked to criticized particular styles or product placements, they did not dismiss the commercial premises of the shows *in toto*. In contrast, members of the comparison group were more likely to reject the shows as a genre on the grounds of their expressly commercial appeals.

Second, both regular and comparison group interviewees were attentive to the reality status of the genre. According to writers such as John Corner and Annette Hill, reality television's aesthetic conventions and this genre's blending of fact and fiction generate spaces for audiences to consider their truth claims. Like Hill's respondents, many of the viewers in this study were well aware of how scripting, editing, and even genre expectations not only shaped but also challenged the realism of the shows. Robert, for example, spotted the producers' sleight of hand in *What Not to Wear*:

When it comes to the unreality aspect of the show, and as I told you, I am a freelance writer and there's spots where I can tell that [the hosts'] responses are completely scripted; typically it's when they're coming up with these really smart-ass zingers. I mean, yes, some of those are real. But particularly when you see them watching the makeover [candidate] shopping, on the day when they go out shopping alone . . . If you look, the way the lines come out, it's definitely scripted. I think what happens is, they sit down, they look at everything, and Stacy and Clinton will make comments – I think the comments Stacy and Clinton originally make as they're watching it are genuine. And then the scriptwriters get it and they tweak it a little bit.

Some viewers criticized the shows for what they saw as formulaic editing that manipulated the emotional ups and downs of the episodes. Cathy, a *What Not to Wear* regular, said:

I think there is a pattern, and I think they could be more creative with their editing on the pattern, because it's almost like after a while, they've just kind of gone into a pattern, more or less. Like, the start is [candidates] are resistant, and by the middle they're being a little more emotional and softening up, and then by the end they're saying how great Stacy and Clinton are. That's pretty much across the board.

Many respondents mentioned that their online interactions cultivated a more reflexive approach to the shows. For example, Deborah, who was recruited through a women's support website based on *Starting Over*, said:

[The producers] show good and bad with all of [the housemates], but I think sometimes they may show more good of one or bad of another, again for TV purposes. But I think most of the people who watch it tend to realize that they do that [. . .] Going on the [message boards] you get a lot of interaction with people and what they think about stuff that happened, and mostly everyone that I've seen their messages thinks the same way I do about all of that.

Another interviewee who was quite active online was Bill, a *Starting Over* viewer. He offered the most sophisticated analysis not only of editing conventions, but also of how the show's production routines linked with existing genres. Bill notes that *Starting Over*:

blends the two great things about daytime TV, which is the self-help focus of a talk show with [*sic*] the hyperbolic drama of a soap opera [. . .] What's refreshing about soaps is that people get hysterical, and that's sort of fun, it's sort of nice [. . .] [On *Starting Over*] it's often like someone's had a horrible fight with another houseguest, and they get all worked up trying to talk to somebody on the phone or one of the other houseguests. And that I find interesting, because it definitely does have that reality show thing of people that get used to having cameras as a part of their world, so if it's not completely manipulated, it's definitely like their guard is down and something's happening in front of the camera, and there's something thrilling about that.

Bill was a regular participant on Television Without Pity (TWP), a particularly astute and witty website that has forums for the synopsis and critique of numerous US television shows. TWP raises audience critique to an art form, as Mark Andrejevic (2008) argues; the website pays "recappers" to provide often hilariously snarky synopses of episodes that "often focus on production details such as lighting and editing, thereby helping to direct the attention to the formal aspects of the shows they describe" (p. 26). Andrejevic argues that part of the pleasure of participating in TWP is in the construction and representation of the self as "savvy" (p. 38), duped neither by the artifices of the production processes nor by the promise that their activities

will have any influence on the producers. Yet Andrejevic concludes that savviness does little to protect TWoP participants from the extraction of labor entailed in the work of being watched while watching shows, to paraphrase Dallas Smythe's famous phrase. On the contrary, the pleasures of critique intensified the participants' investment in and loyalty to particular shows.

Further, it is striking that, despite this savviness, many of the people we talked to remained highly invested in what Ien Ang calls the "emotional realism" of television (1985, p. 45). This describes the audiences' attribution of emotional authenticity to a television show (*Dallas*, in Ang's research) that is also seen as highly artificial at the "empirical" level, in terms of setting, apparent wealth, plot, and so on. In my make-over study, the audiences' recognition of the genre's constructed elements sometimes enhanced their sense of the shows' emotional realism. Danielle acknowledged that *The Biggest Loser* producers recruit a particularly emotional group of contestants, but nevertheless she saw the show's rituals as precipitating expressions of real feeling:

I think [the emotions are] realistic because of the intensity of their circumstances . . . They might pick people who are more emotional, or people who express themselves well because obviously they want people who are going to be expressive because otherwise the show might be boring. So partly it's the selection process, but I also think it's the circumstances that bring out emotion – anybody would be emotional in such circumstances when they're making these dramatic changes in their lives and they're in these intense circumstances with competition and exercise and diet [and] getting weighed on national TV on the world's most gigantic scale. [Laughing]

The viewers' often quite sophisticated critiques of the impact of production processes on the empirical realism of the shows sits in an uneasy tension with the same viewers' perception of the shows' emotional realism.

The regular viewers were highly reflexive about the production contexts, the need to produce good television for audiences, and the commercial demands on the shows. Even if reality television allows audiences a reflexive distance from its processes and aesthetics, however, Corner (2009) is not optimistic that this involves either "a new reflectiveness on the part of program makers" or "a new refusal on the part of audiences to accord reality status to what they see on television" (p. 62). Savviness about production processes does not herald an era of media literate and critically distanced viewers in any simple way. For many of the regular viewers in this project, critical appraisals of the shows intensified their engagements with them, especially when these appraisals were shared in online discussions with other fans. Critiques of the shows' empirical realism do not dislodge perceptions of emotional realism; the regular viewers who participated in this study saw the emotional expressions as real, despite – or even because of – the constructedness of the circumstances in which such expressions appeared. Media reflexivity does not necessarily offer protection from the ideological and industrial contexts of watching the shows, as advocates of media literacy would assume.

Research Reflexivity

Occasionally respondents were also reflexive about their participation in the research project, being aware that they were constructing narratives about the shows for a particular audience: a media researcher. They reflected about the research process in three ways. First, interviewees indicated that they were aware of their own narratives as constructions, a way of telling a story. One viewer, for example, struggled to tell a coherent narrative about what she saw housemates going through on *Starting Over*:

That's really tough because I'm trying to figure out what angle to come at it from. I guess the easiest way for me to break it down in my head is the different seasons; I actually started watching it towards the last part of season two. I was home and stumbled across it and got hooked. And then on another channel they started showing season one. So it was kinda cool; I was watching Chicago one day and LA the next. And it was a totally different feel.

This interviewee suggests that she consciously selects both “in [her] head” and for the interviewer one out of several narrative options to describe her watching two *Starting Over* seasons in parallel.

In the second type of research reflexivity, interviewees indicated that they were aware of popular and academic critiques of media audiences as dupes. This may have been especially acute for women viewers, who are used to defending genres that are traditionally associated with women and are considered to be low-brow forms of entertainment. One woman, for example, wanted to avoid being seen as a dupe of *The Biggest Loser*. When the interviewer asked whether she felt that the show's editing allowed viewers to see participants in a relatively real way, she said:

Yeah. I almost hesitate to say that because so much of reality shows, everybody just hates them, or they say they hate them and watch them in private . . . I don't want it to come out as “Marci says . . . and boy is she an idiot!” [Laughing]

This interviewee was most explicit about her awareness of how her perceptions of *The Biggest Loser* may confirm negative stereotypes about (women's) fandom of reality television. The interviewees' awareness of negative characterizations of audience behavior came through in many interviews, however, where these people expressed embarrassment about the kinds of shows they watched and about their emotional connections with the candidates.

In a third type of research reflexivity, the interviewees acknowledged that they were in a reciprocal conversation between interviewee and interviewer. *What Not to Wear* viewer Barclay teased the interviewer for posing leading questions to her, in a way similar to that of the hosts on makeover shows:

-
- INTERVIEWER: Do you think that is a theme in the show, that there's a "real you" in the end, that wasn't showing in the beginning?
- BARCLAY: Yes, that's a good way to put it. You've just done the TV thing. Now I'll say, "Yes, it seems like . . ."
- INTERVIEWER: I'll admit it was leading!
- BARCLAY: You can just use my quote.

This exchange suggests that Barclay was well aware of media conventions whereby unequal distributions of power produce the discursive outcome of the encounter. Credentialed interviewers (makeover hosts, journalists, academic researchers) shape what interviewees (ordinary people) will say and then use it in a quote, in order to confirm what the interviewer already wanted to argue.

Some interviewees thus saw the interview encounter reflexively. Although observations about the research context were fewer than about self-reflexivity and media reflexivity, respondents frequently saw themselves, their media consumption, and even their participation in this research within broader social and institutional contexts.

Producing Reflexivity

Three types of reflexivity – addressing the self, media production, and research processes – come into play in the study of makeover television audiences. These are not distinct, however, but rather intersect within the contemporary project of producing a self that is generally reflexive. The fact of seeing and representing the self as reflexive offers a defense against the broadly held assumption that television audiences are media dupes. Self-reflection allows a pleasurable relationship with a self that can be explored and expressed. Further, interviewees' research reflexivity draws one's attention to the power differentials between researchers and subjects: the latter wrest back a portion of the control usually assumed to belong to researchers. Collectively, reflexivity has been constructed as an ideal mode of subjectivity in which people represent themselves as being apart from, and therefore as having agency in relation to, both themselves and their contexts.

Reflexivity did not, however, function equally across all the shows and all the viewers. The degree to which regular viewers reflected about their engagement with makeover shows depended to some extent upon the specific show they watched and their degree of social interaction with other people about that show. The four shows mobilized very different levels and types of self-reflexivity among the participants in this study. Regular viewers were most likely to discuss *What Not to Wear* and *The Biggest Loser* in terms of self-reflexivity conceived of as self-surveillance; the emphasis placed in these shows on the scrutinizing and sometimes hidden camera was adopted by many interviewees as a technique they applied to themselves. *Starting Over* interviewees were most likely to exercise self-reflection through the construction of life

narratives that echoed the narratives profiled on this show. *Queer Eye* interviewees were not especially reflexive about self or media, which surprised me, because it is the one most similar to *What Not to Wear* in its style and techniques. This makes me wonder whether the emphasis on men's transformations made this show less successful in engaging the kind of self-scrutiny and stories that characterize feminine approaches to the self.

Those interviewees who had a lot of social contact with other viewers were most likely to be reflexive about the media contexts and techniques of the shows. Those who were active on online message boards were especially articulate about their perceptions of the production conditions and generic formulae of the shows. The ability to learn and share background knowledge about the shows seemed to encourage sometimes high levels of skepticism about the truth claims of the makeover genre, if not the shows' emotional realism.

What did not seem to make a great deal of difference in reflexivity among regular viewers was their gender or their levels of education. Andrea Press (1991) and Skeggs and her colleagues (2008) found that middle-class women were much more likely to distance themselves from television content, whereas working-class women were more likely to identify with the characters or candidates on screen. The middle-class women in Skeggs and her colleagues' research reflected upon lifestyle reality shows' manipulative techniques and low-brow status and tended to ally themselves with the researchers who they assumed shared this view. Working-class women, in contrast, seemed less comfortable with the research process, tended to identify with the women in the shows, and placed themselves in the narratives by imagining how they would feel or respond, which the researchers call "immanence" (p. 15). On the other hand, I found very little difference among regular viewers, across genders or a range of education levels, in terms of how much they reflected about themselves and their viewing practices.⁴ If self-reflexivity is an immanent position and media reflexivity a distanced one, regular viewers' expressions of immanence and distantiation were more related to the shows they watched and to the amount of online interaction they had than to their own gender or education levels. Further, some of these interviewees expressed both immanent and distanced perspectives on the same texts, which suggests that these approaches are not mutually exclusive. Among people already invested in the makeover shows, immanence–distantiation is not a single continuum determined by gender and class but can describe positions held simultaneously by the same person – for example someone who is emotionally highly invested in a candidate and sees herself in a similar position, while also critiquing the artifices of the show.

I found more differences between participants across education levels and gender in the comparison group, however, in a way similar to that described by Skeggs and her colleagues (2008), although these differences were less marked than in their research. The comparison group as a whole made fewer observations about production context, probably because these necessitate some familiarity with the show over time, and there were fewer examples of self-reflexivity in this group. Within the comparison group cohort, interviewees with fewer years of education tended to

describe the contents of the show with less critical comment than those with more education, and they were less likely to be self-reflexive in response to the texts. There were still moments of reflexivity here too, though: Chris, a man with a high school education, commented on the editing of *What Not to Wear*: "It did look like they made you see what they wanted you to see." Comparison group interviewees with more education tended to be more frank and more critical. Peter, who had a bachelors degree, commented on the editing in *Starting Over*: "I mean it's TV. It's trying to manipulate you. John Forrest said 'When faced with telling the truth or telling the legend, always tell the legend.' Well, the same goes for reality TV." Peter's comment might be more literary than Chris', but I wouldn't claim that it is more reflexive. The middle-class distanced and working-class immanent associations that Press and Skeggs and her colleagues found in their studies may be somewhat stronger in the comparison group, but not overwhelmingly so.

The very similar levels of reflexivity among regular viewers of different genders and educational levels may be interpreted in a number of ways. High degrees of reflexivity demonstrate the persuasiveness of the text: the shows effectively interpellated their regular audiences by encouraging particular ways of talking about the self in relation to the shows. Regular viewers who were recruited on internet message boards participated in social online activity that cultivated a shared critical perspective among a group of savvy viewers. Additionally, high levels of self reflexivity prioritized the perspectives of the affluent and educated people who were overrepresented in the self-selecting group of regular viewers. These arguments have weight, but aren't sufficient to fully account for the contrast in degrees of reflexivity between the regular and comparison group viewers. The first may account for the self-reflexive, immanent engagement with the shows but not the distanced view that media reflexivity affords. The second ignores the many respondents who said they had minimal online interactions with others and merely went online to get information about the shows. The third argument fails to account for the highly reflexive statements among the regular group interviewees who had fewer years of education than the cohort mean.

I began to consider the high levels of reflexivity among the regular viewers who self-selected into this project partly as a product of the research exchange itself. Whereas Giddens argues that reflexivity is an inherent attribute of modernity, Adkins (2003) and Skeggs and her colleagues (2008) argue that reflexivity is a performance of selfhood in situated moments. They write: "In our research, the groups of women recruited from different classed and raced backgrounds deploy their available cultural resources to produce 'performances' of class, *made* rather than found, in each particular type of research event" (p. 7). Because the regular viewers were self-selecting, those who volunteered were already likely to be invested in reflexive self-performances, irrespective of gender or educational background. This group wanted to talk about the shows, what these meant to its members, and how they contextualized them in their own lives. These participants were aligned with the overarching project of the four makeover shows that encourage, allow, or demand self-reflexivity. But this is also the project of audience research: both makeover shows and audience research require that

participants produce a reflexive self, someone who can see the self as if from the outside, who can tell stories about the self, and who values authentic self-expression.

Both research and makeover television offer people across genders and a range of educational backgrounds the possibility of performing self-reflection, which comes with certain pleasures and privileges. Self-reflexivity suggests leisure, media reflexivity suggests literacy, and both are historically the product of privilege and status. Makeover shows democratize both kinds of reflexivity by situating them in the ordinary; audience research expands the reach of reflexivity through its commitments to representativeness. Reflexivity isn't a part of modern identity because it is inherent to the modern condition, but because it's valuable and valued and it grants status.

This is not to simply celebrate reflexivity as a freedom afforded by media engagements and research participation. As Rose (1999) and others have noted, self-monitoring and therapeutic techniques are less freedoms to create oneself than they are expectations of modern citizenship. Self-reflexivity is compatible with the neoliberal values of responsibility, agency, and choice, and media reflexivity does not in itself liberate audiences from the commercial reach of media systems. Even commitments to epistemic reflexivity may obscure the possibility for co-optation. Those of us engaged in audience research must consider how our practices situate participants within larger frameworks of good citizenship: "Look! Audiences have agency! They aren't dupes! They are self-aware!" Further, we must be cautious about reifying identity categories (gender, class, race, age) that are as much an invention of biopolitics and market segmentation as they are meaningful ways to compare audiences. This is particularly so when we valorize reflexive performances that may be more likely (though not necessarily) to be articulated by well-educated research participants.

Audience research neither demonstrates that audiences are free from textual influence through their reflexive practices, nor offers the opportunity for participants to free themselves from such influences by reflecting upon their experiences. Instead, like makeover shows, audience research invests in an economy of knowledge that produces reflexivity for institutionally useful ends (even if these may also be ends that we prefer). Such considerations should not paralyze audience research, however. Rather than looking from the outside in at how the media promote expressive and reflexive performances of selfhood, we can consider how *both* makeover shows and the research interaction encourage expressivity and reflexivity that are part of a larger cultural impulse toward these modes of selfhood.

NOTES

- 1 This chapter develops themes originally presented at the Affective Audiences preconference at the International Communication Association's annual conference in Chicago, 2009.
- 2 Thanks to research fellows Christopher Finlay, Nicole Rodgers, Adrienne Shaw, Riley Snorton, and Margaret Sullivan for their efficient and enthusiastic efforts on this project.

- 3 Thanks to Diana Mutz for generously sharing research subjects from her study.
- 4 Because class is a notoriously difficult concept to define, especially in the US, I take education as a measure of people's likely access to economic, social, and cultural capital.

Reflexivity in Data Analysis

Constructing Narratives of Family Digital Media Use In, Through, and For Public Engagement

Lynn Schofield Clark

ABSTRACT

Drawing from a large study of digital and mobile media use among US teens and their families, this chapter reflexively traces the way in which a particular research narrative about media use came into being. The narrative in question focuses on a young woman who engaged in extensive and troubling digital and mobile media use. Various stakeholders – university students, research assistants, members of the public, and members of various academic research communities – offered differing and sometimes conflicting interpretations and explanations of this narrative, in effect becoming collaborators in the process of data analysis and in the narrative's reconstruction. The chapter argues that it can be helpful to consider such contradictory responses to potentially polarizing research narratives, since, in an era of reflexive media scholarship, researchers are accountable for the ways in which their writings might contribute critical perspectives to public debate. By reflexive data analysis I mean an act of recognizing that the researcher, as a socialized agent, shapes her analysis in accordance with the creativities and constraints afforded in relation to her place in the social structure. The chapter therefore argues that how a researcher understands the audiences of research narratives contributes to the construction of such narratives, and a reflexive approach to this process can prepare scholars to contribute productively to public conversations about the role of media in the lives of young people.

Introduction

As my own children have entered their pre-teen years, I have come to have more in common with the families of pre-teens and teens that have been at the center of my interview-based and observational research for more than ten years. What I've become interested in recently includes not only how technology is coming to play a role in the everyday lives of families, but how parents and teens *understand* the role of technologies in their lives. I'm also concerned about how our research contributes to – or could contribute to – those understandings. In other words, I want to know more about the discourses that shape and inform how people approach the “problem” of technologies in the home, and how we as researchers might contribute new directions to that discourse.

In this chapter, therefore, I present a case study of how a particular narrative that emerged in my research project “Teens & the New Media @ Home” became meaningful in different public contexts that included parents, young people, and members of my own research community. I present here the story of how I worked on the analysis of this narrative and in the process became aware of my own biases and intentions. I also discuss how I became aware of the different assumptions that shaped and ultimately determined how various audiences interpreted the narrative and gave it meaning. From this I make the argument that, as qualitative media researchers become more familiar with how our research narratives are received by differing audiences, we can consider how to present our work in such a way that it contributes best to public discussions and to public culture by reframing debates about the role of the media in family lives and in society. Thus, to frame this study, I begin by considering how critical cultural studies media audience researchers are currently thinking about what it means to be reflexive researchers, and I conclude with considerations on how such reflexivity—specifically about what we write, for whom, and why – might better enable us to understand the roles that we are positioned to play in contributing to the direction of the dominant discourses surrounding media in US family life today.

The Rise of Reflexivity in Media Audience and in Qualitative Methods Research

There's a certain irony in the fact that we as audience researchers haven't always been very reflexive about how we interact with our own audiences. As Patrick Murphy (2008) noted in his review of the evolution of media user or “audience” studies, the field has gone through four distinct phases in relation to qualitative research methods.

The “interpretive turn” of the mid-1980s, he argues, was largely the work of feminists who were striving to challenge the frameworks of textual criticism that

emphasized how media *auteurs* constructed meaning and intended their works to be understood. Feminist scholars were also interested in contesting elite critics' interpretations of media texts and policymakers' efforts to police and control the media environment (for early examples of the interpretive turn, see Ang, 1995; Morley, 1980; Radway, 1984). The earliest approaches to qualitative media audience research, Murphy argues, were *expository*: they sought to grasp things from "the natives' point of view," to cite anthropologist Bronislaw Malinowski. Researchers such as James Lull (1980), Andrea Press (1989), and Thomas Tufte (2000) wanted to tell richer stories about different kinds of audiences and about their varied engagement with media in their everyday lives. Yet, Murphy observed, the researchers often seemed to disappear in the process. Researchers are slightly more visible in what he termed the *observational* style of S. Elizabeth Bird (1992a, 1992b, 2003) and Sonia Livingstone (2002, 2010), both of whom more clearly allow interviewees greater control over the research encounter.

By the middle of the 1990s, a third style of qualitative media research and writing had emerged: the style that Murphy terms the *interactive*, which was dialogical in nature, incorporating "a mixture of narrative, polyvocality, contextual information, and reflexivity" (Murphy, 2008, p. 280). Gillespie's (1995) work on British Indian families watching television in London was one example, and work by Kim (2006) and Acosta-Alzuru (2005) also embodied this approach. Interactive researchers recognized that we needed to locate ourselves in the field when writing up our research narratives, and this usually meant paying attention to the researcher's intersecting positions on race/ethnicity, class, and gender, among other things (Chavez, 2008; Clifford & Marcus, 1986). It also meant recognizing, as Erving Goffman (1959) reminded us in the middle of the twentieth century, that the stories people tell through their words and actions are part of a performance that a person or a set of people enact as a channel for communicating who they are and why they do what they do. This doesn't mean that the stories we hear in research settings aren't true; it just means that, as researchers, we need to be mindful of the fact that they are told for a reason. The teller may want to "get my story out there," or she may want to help a researcher (or help herself) by trying to tell the story she thinks the researcher wants to hear (Stoller, 2005). For instance, when studying how parents and their children talked about media use in their homes, my colleagues and I observed that parents relied upon "public scripts" about media, as they offered us what we termed "accounts of the media" (Alters & Clark, 2004). As we wrote:

Our use of the term "accounts of the media" references two different yet complementary meanings of the word "accounts." First, the nature of interviews means that parents were called upon to offer stories, or accounts, of how their family operated in relation to media [. . .] Second, the term "accounts" refers to a related phenomenon that structured how the parents told their stories about media: Parents were self-consciously aware of the importance of parenting, a task for which they felt accountable. The accounts of the media that parents gave in our study were always inflected with their assumptions about proper and desirable parental behavior in relation to the media. (Alters & Clark, 2004, p. 5)

In other words, whenever parents told us what their families did regarding media within the household, their stories were inflected with the knowledge that they were accountable, as parents, for maintaining some control over their children's media environment. Because they wanted to present themselves as good and responsible parents, they shared many concerns about the violence, sex, and stereotypes they saw and heard in mainstream media, and they told stories that tended to overstate their interventions into the media lives of their children (even as the children sometimes agreed with, sometimes contradicted, and sometimes simply misunderstood their parents' intentions).

This particular chapter grows out of concerns with public scripts in my earlier research and aims to contribute to what Murphy describes as the fourth phase of qualitative media research – what he terms the *reflexive* approach. In Murphy's definition, "reflexive" research involves "the observation of participation" and ruminations on the processes of representation itself, as seen in work by Kraidy (1999), La Pastina (2006), and Parameswaran (2001), among others. According to Murphy (2008), this latter style of ethnographic writing "invokes personal experience as a way to push the limits of difference and explore the boundaries of and potential for identification in a manner that asserts a political and ethical commitment to understanding how power operates" (p. 281). This reflexive approach points the lens toward the researchers and the "public scripts" that shape the researcher's own manner of telling stories, recognizing that we *all* speak through existing narratives. It also recognizes that some narratives, such as those related to certain racial/ethnic, gender, and class positions, are "coded as 'good science,'" as sociologist Michelle Fine (1994) has noted (see also Mayer, 2005).

Within this reflexive approach, it's important to acknowledge that those of us who are professors, scholars, and even college students are now or may become members of what sociologists Barbara and John Ehrenreich (1977) termed "the professional/managerial class." Power and responsibility accompany this cultural position. As organizations, politicians, journalists, marketers, and others seek the attention of the professional/managerial class, the needs, desires, and assumptions of this group come to have consequences in the "real world": they influence, among other things, the ways in which teachers teach, the ways in which labor and childcare are arranged and managed, the ways in which healthcare is sought and disbursed, and the ways in which newspapers represent problems. Therefore, even as we *contest* certain cultural narratives in our work, those of us who write research narratives may inadvertently *protect* other cultural assumptions, as Mayer (2005) and Seiter (1990) have each pointed out.

For example, it is important for scholars to recognize that their work operates in relation to power and can serve to construct versions of "good parenting" that support certain norms of middle-class life. As we seek to draw connections between our scholarship and the concerns of public life, we can become engaged in what Nikolas Rose (1999) has termed the governance project of neoliberalism, transferring the responsibility for parenting wholly to individual parents and absolving the public and

the government of any responsibility for providing supportive structures for family life. This is further complicated by the fact that parents, policymakers, and educators often seek advice about how adults should handle media in relation to young people, and this often shapes a media scholar's invitation to speak publicly in the first place.

We need to become aware of our own biases and of the very human tendency to want to protect our own interests, as prior reflexive researchers have noted. Yet we cannot fail to notice that our cultural position also affords us opportunities to critically evaluate existing discourses and to do our part, when possible, to participate in challenging them. The question is: how do we do this effectively when it seems that much of the public criticism of the media is out of step with our own?

As scholars, we have been socialized to produce what Hills (2002) has termed "institutionally acceptable forms of knowledge" primarily for academic audiences (p. xil). However, I want to highlight the fact that our *potential* audiences include not only the scholars who read our work in scholarly journals; as our work becomes part of a larger knowledge base that shapes the questions to be asked and the concerns to be addressed in public life, our broader audiences may include parents, college students, policymakers, educators, and many others we might not even anticipate. In other words, our audience may, and probably should, include members of the broader public who are also concerned about the role of the media in social change and in everyday life. Hence I'd like to suggest that scholars should explore how the various constituencies of which we are a part understand the stories we tell about those who live in a highly mediatized world. We must consider that the narratives we create may become part of the cultural repertoire that shapes how others think about and experience digital and mobile media in their everyday lives (Swidler, 1986). Such contemplation about the forces and contexts that surround research becomes an ethical concern, then: we need to be reflexive not only about our biases and our positionalities as analysts and writers of research, but also as producers of knowledge whose narratives of research inevitably enter into dialogue with narratives that existed before our research. These narratives can frame how our research will come to have meaning among various constituents.

Having a foot in the worlds of parenting, college teaching, and scholarly research, and hearing how digital and mobile media are discussed in these various settings, I am reminded of what Annette Markham (2009) has referred to as the multiplicities that can emerge when we strive to be accountable for the stories we tell. My own analysis becomes more partial and hesitant, but – I hope – also more nuanced for taking into consideration the many ways in which different people have a stake in how stories are told, to whom, and for what ends. I want to become more reflexive about how the narratives of research that I want to craft acquire their meanings within different contexts. And this, in turn, will highlight the responsibilities that a researcher has today as she makes choices regarding which stories to tell, how to tell them, for whom, and with what consequences.

In the next section, therefore, I share the narrative of Kayla's story and its interpretations, highlighting the contexts in which this particular research narrative

becomes meaningful. I also show how research comes to have meaning as the result of collaborative conversations between researchers and a host of people we meet in our professional and personal lives, who help us make sense of our work. Of course, we don't usually think of college students and of our neighbors and friends as collaborators in the analysis of our data; we don't think that way even of our academic colleagues most of the time. As academic researchers, however, even when we speak casually to other peer researchers, we are inevitably opening ourselves up to interactions that shape our findings and our awareness of what audiences might expect from our research.

How Research Is Made Meaningful: The Story of Kayla's Story

"Can you believe she said that?!!" my college-aged research colleague Caroline exclaimed as we read the transcript of the interview she'd done the day before with an 18-year-old high school senior. The young woman she'd interviewed, who we'd called Kayla, had stated that giving up her iPhone and Facebook account would be akin to "losing something very dear to me, like a baby or something." Caroline was surprised by Kayla's impassioned response because she knew that Kayla had had very negative experiences online with ex-friends and ex-boyfriends who had taunted her and had posted mean messages for her to see. To hear Kayla speak of her online activities as if they were a positive and meaningful part of her life came as something of a shock to Caroline, and she believed that Kayla's embeddedness in digital and mobile media would be of great interest to me as a researcher looking at teen and parental practices around these things.

But, in spite of my young colleague's surprise, Kayla's comment about how important social media were to her was not a completely unexpected or inexplicable statement to me, given the existing research on the topic. Researchers such as Danah Boyd (2008), Susannah Stern (2007), and Amanda Lenhart (2002, 2007, 2010) have long been discussing the crucial role that mobile media and social networking sites have come to play in the lives of US teens. By 2009 research had demonstrated that more than 95% of households with children had cell phones and that more than 65 billion text messages were sent in one month alone (Cellular Telephone Industries Association (CTIA) Semi-Annual Wireless Survey, 2008; Lenhart, 2010). We know that teens don't differentiate between online and offline communication with their friends; they rather view their online practices as an extension of their social lives, and thus they live out what concerns them most in both places (Watkins, 2009). So I listened to Caroline and other members of my student research team as they discussed what they found interesting in Kayla's story – the story of a young woman completely immersed in digital and mobile media. Yet I also recognized, somewhat sadly, that an analysis emphasizing Kayla's emotional attachment to digital and mobile media would verify what others

had already found rather than contributing something new to the conversation. And, as a researcher, I was expected to do the latter.

For me, what was more surprising and compelling in Caroline's conversation with Kayla occurred later in the interview, when Kayla was asked why she thought her mother and father didn't have any rules to govern her rather excessive and self-destructive mobile and digital media use. "They just don't care as much as other parents," she said with a shrug. Why, I wondered, would a teen like Kayla give lack of caring as an explanation for her parents' lack of rules governing digital and mobile media use? From the rest of her interview, it did seem that Kayla's parents didn't place many restrictions on her mobile and digital media use. But there were many young people in our sample who had similarly minimal restrictions, especially among the older teens we had interviewed. Most of the time during our interviews with them, older teens with few restrictions on their digital and mobile media use had responded with a comment akin to the one made by 16-year-old Montana. Montana's mother knew little about what her daughter did online, but, as Montana noted, "my mom teaches us what is right and wrong but she doesn't set limits 'cause she trusts me." Trust, not lack of caring, was the common theme that had emerged in how older teens and their parents discussed the rules governing digital and mobile media use (Clark, 2009). And in fact Kayla's mother did talk about how she trusted Kayla to make the right choices. Or at least she wanted to trust Kayla, in spite of the fact that Kayla had engaged in cyberbullying and cyberstalking, had posted online numerous unflattering photos and comments about being drunk or engaging in other risky behaviors, and had generally spent so much time online and texting that she'd almost failed out of school. Were Kayla's parents more tuned out than they seemed to be? Was Kayla just a troubled kid? Was no other explanation needed? And what difference would it make if, as I later came to conclude, Kayla's complaints about her parents' apathy were calculated to gain the researcher's sympathy?

At the time when we were first analyzing the interviews, I believed that I was focusing on the second comment because it was so different from what I'd heard among other teens, and thus it could lead to new insights, worth sharing in research settings. Later I came to see what seems now obvious: the comment about her parents stood out for me, at least in part, because I am a parent, and I am situated in narratives of parenting that would react to such a statement with disbelief, as if it were not a true statement (e.g., "Kayla is lying, and of course her parents care; she's just trying to get Caroline's sympathy"), or, even worse, with judgment ("well, if her parents don't care, then that explains why her life is such a mess"). I didn't think that either of those approaches constituted a sufficient or compelling explanation for Kayla's attachment to digital and mobile media and for the irreplaceable role they had come to play in her life.

Caroline had suggested that she interview Kayla when she'd be working with my research team on the *Teens & the New Media @ Home* research project, an interview-based and observational research effort that extended nearly over a 10-year period. The project, which included close to 300 in-depth interviews with teens, preteens,

and their parents, had occasionally relied upon younger research team-members to identify and interview participants of high school age.¹ Caroline and Kayla had been co-workers, and Caroline sensed that Kayla, who was four years her junior, looked up to her. It wasn't surprising, then, that Kayla created a narrative about her digital and mobile media use that sought to garner Caroline's sympathy. Caroline also knew that Kayla's father and mother had divorced and that Kayla's father had become increasingly distant from his daughter, despite her obvious admiration for him and her tendency to glorify him while denigrating her caretaking single-parent mother. A lot of Kayla's acting out through digital and mobile media seemed to be an effort to gain the attention that she was lacking, in Caroline's view.²

My own response to Kayla's story wasn't initially as sympathetic as Caroline's. She reminded me of my own onetime "best friend" Beth, a physically beautiful young woman whose flair for drama, desperate need for attention, and tendency toward self-destruction meant that at any moment those closest to her could become the target of her meanness. In Kayla I saw a young woman who had shown poor judgment time and again. She had been both a perpetrator and a victim of cyberbullying. She had been disloyal and cruel to people she claimed were her friends; her best friend Rhonda became her ex-best friend when Kayla slept with Rhonda's boyfriend.

I also recognized Kayla for the kind of young woman whom my own mother would have labeled a "troublemaker." In addition to her relational troubles, Kayla had been threatened with expulsion from school because she'd refused to take down from Facebook photos of herself that flaunted sexual innuendo as well as the use of illegal drugs and alcohol. As a parent, I knew that, if my own daughter had a friend like Kayla, I'd be worried. And, if my daughter started acting out as Kayla did, I'd know that I had a serious problem on my hands.³

As I started to talk about Kayla's story among my own circle of (mostly non-academic) friends, I noticed that their initial response to the story echoed my own. Those who were parents tended to sympathize with Kayla's mother and father. They knew moms who were similarly exasperated by daughters who seemed unreachable, or they had felt that way about their own child at one time or another. If they had been a "Kayla" themselves at an earlier point in their lives, they had even greater empathy for what Kayla's parents were going through. And, if they were parents of younger children, as many of my personal friends are, Kayla's story triggered worry. What was it about the technology and/or about Kayla's earlier life that had made her more vulnerable to such self-destructiveness, they wondered – and what could they do to help their own children to avoid a similar fate? I realized that part of the reason why Kayla's story seemed so compelling to me was that I was positioned as these worrier-parents are: that is, unable to avert my eyes from Kayla and identifying, in alternation, with her victims and with her parents.

Then I told Kayla's story to my college students. I found that college students empathized with Kayla, recalling their own struggles with being cyberbullied or reliving the shame of having been perpetrators. They related to the way in which Kayla talked about the importance of connecting with others through digital and mobile

media. They related to her choices, too; what I had seen as cruel and self-destructive behavior, they described as characteristics of what they argued were “normal” risk-taking behaviors in teen culture. They noted that risk taking was a way of establishing oneself as desirable, adventurous, and exciting. They also noted that excluding others (even friends) in dramatic ways was a means of making a claim for attention and popularity. Their analyses echoed those of social scientists who have explored why young people engage in risk-taking behaviors (Lying, 1990; Cohen & Taylor, 1992; Douglas, 1992; Lupton, 1999).

The college students who heard Kayla’s story also related to her sense that her parents had no idea about her experiences: “My mom didn’t know what was going on a lot of the time either,” 20-year-old Meghan said, noting that her mother, like Kayla’s, regularly combined the names of the two most popular social networking sites, Facebook and myspace, incorrectly referring to “MyFace.” College student Meghan said that she too, like Kayla, had hidden many of her riskier practices from her parents even as she’d widely shared them among her peers online. Meghan and her peers didn’t believe Kayla when she claimed that her mother and father didn’t care, but they didn’t think that was a particularly poignant or meaningful statement from Kayla, either. In fact my interlocutors of college age read my concern as that of a worried parent, or at least as that of someone they needed to reassure. I shouldn’t blame either the technology or the parents, they told me – as if my adopting one or the other position were behind the fact that I was telling Kayla’s story from my research in the first place. Which in turn made me question why exactly I *was* telling the story.

Researchers of digital and mobile media related to Kayla’s story in yet a different way. “New media can be so isolating,” one colleague said, shaking her head as she placed Kayla’s story of digital media overuse squarely in the realm of behavioral studies that tend to see technologies as creating problems for individuals and for society. Another colleague, situated within the critical/cultural studies tradition of research, as I am, raised an interesting question, but he also identified himself as “blissfully unaware” of the fears of parenting – a not-so-subtle reminder that research into parenting is definitely not a hip topic in academia and is sometimes viewed as inherently conservative. “But she seems like an awfully extreme case,” yet another skeptical critical/cultural studies colleague protested. This colleague questioned both how I was interpreting Kayla’s story and whether or not I should tell it at all. He argued that Kayla’s story could reinforce concerns about digital media causing stress and harm among individuals. Such stories tend to gloss over broader concerns of inequitable distribution of digital access, he suggested. Another colleague agreed, pointing out that stories like Kayla’s can overwhelm any consideration about the possible positive uses of digital and mobile media in young peoples’ lives – and that, this colleague felt, was the kind of research that parents, educators, and policymakers especially needed to hear from the research community right now.

So what was the story that I wanted tell, and why was I interested in telling it? Caroline’s explanation, rooted to some extent in the logic of family systems therapy, explained why Kayla’s actions served to worry her mother, to get her father’s (and

everyone else's) attention, and to garner her a reputation among her peers as an adventurous and dramatic risk taker. Her actions were understandable given their currency within her peer culture, as my college students had pointed out, even as they were also made comprehensible in light of parental worries and within the framework of "dangerous media/vulnerable children" that researchers, policy-makers, and journalists tend to reinforce for parents. In fact the only community where her story didn't fit was my own primary scholarly home of cultural studies and reception research scholars, who prefer stories of active and creative digital and mobile media users to stories of pain and self-destructive behavior. This lack of fit is what probably made her story particularly compelling to me as a parent with insider knowledge about how both parents and researchers might respond to it.

As I tried to grapple with the different ways in which parents and young people approached Kayla's story, I was struck by the paradoxes of life in contemporary US society that are reflected in this story. We all want the bonds of community and meaningful relationships, as well as the time to attend to the people who matter to us. This is what's at the root both of parents' concerns for their young children and of the desire of young people like Kayla to remain connected to their peers at all times, even if such connections are painful. Yet the demands of the economy drive us to value efficiency and speed, and to appreciate the importance of "looking out for number one," or of creating our own "personal brand" in order to compete in the global order (Peters, 1997). Thus we employ technologies in our lives in order to maintain and improve relationships with those who are most important to us, even as our use of those technologies feeds the engine that, in turn, drives technology companies to produce new technologies that are faster, smaller, and less expensive and make life more efficient and paced faster than ever before. And we rely upon the media tropes of celebrity and upon the commercial realm to reinforce who we are for ourselves and for others, so that young women like Kayla learn to act like a "star" in the drama that is her own life – often in ways that can undermine her other, more relational goals. Kayla's story of "live fast, die young, leave a trail of glory online in your wake" is part of an old story of the celebration of youth in Western culture, and it is also part of a more contemporary cultural message: it reveals what it means to grow up in the context of a digital age in which technologies enable meaningful relationships even as they can also exacerbate and undermine our ability to maintain those meaningful relationships. Perhaps we need so desperately to give precedence to the importance of relationships in our lives because it feels as if our ability to shore up those relationships is constantly under siege.

And there is a responsibility for the researcher, then, in how Kayla's story is told and what it might come to mean in various settings. I believe that many cultural studies and critical scholars seek to call attention to the paradoxes and dilemmas of everyday life and to the role that technology plays in those dilemmas. We are interested in "the contrast between what is said and what is not said, between what is explicit and what is assumed" (Morningstar, 1993). We hope that our research might help others to better understand how certain taken-for-granted cultural practices come to be valued and

repeated not because they're reasonable or because they will actually help us meet our goals (achieve the life we want, or reach the society we want), but because they are part of a commonsense way of doing things that, upon reflection, tend to benefit the status quo and reflect our culture's darker side (Swidler, 1986).

Kayla's story can therefore speak to the concerns of parents, young people, and scholars, even if it raises more questions than it answers. Stories like Kayla's can remind those of us in critical/cultural and qualitative media studies that we don't always acknowledge the pain and disappointment that can be a part of parenting and of childhood. Because we don't foreground these key issues, we are not always prepared to consider how fears of these things shape the anxieties people bring into their considerations of the role of the media in our everyday lives. If critical/cultural studies scholars want to move the debate in the direction of considering the opportunities as well as the risks of digital media, we need to take seriously the fact that concerns about both positive *and* negative personal and interpersonal experiences inevitably guide the ways in which people approach the role of media in everyday life. Thus I believe that stories like Kayla's are important because they provide an opening for discussion. When we recognize, together with the audience of parents, educators, and policymakers, that young people like Kayla need support and are seeking relationships and are doing so ineffectively, then we can also raise the question of contrast: how do other young people learn to utilize digital and mobile media so as to gain support more *positively*, and so as to develop good relationships? Rather than allowing our interlocutors to counter us with questions about the "problem of the media," therefore, we are participating in reframing that question in terms of how media are situated in relation to shared hopes and goals. As scholars, we may find a more receptive and broader audience when we acknowledge, rather than overlook, the felt experience of our audiences.

By recognizing and speaking to existing concerns about childhood fears and disappointments, an analysis that addresses digital and mobile media use within a stratified society can also take a different direction. Rather than viewing digital media along the lines of a "digital divide" or deficiency model, in which some have privilege and others are lacking it, we can bring to the fore adult concerns about addressing children's negative choices that span the economic spectrum. This foregrounds children's agency while also drawing attention to those young people and families that find ways of working within their own contexts. How they do so then becomes particularly interesting and helps to reframe the conversation, transforming it from one of individual choice into one of structural limitations. This, in turn, raises new questions, such as: How are our society's focus on efficiency and our subsequent use of digital and mobile media creating challenges that are greater for the more disadvantaged families than for the middle-class ones – and also different in kind?

One relevant example of how we as scholars might participate in and contribute to a publicly-minded research that reframes debates about media effects comes from the field of family studies in the US. Frustrated with the ways in which conservative think-tanks were defining women's roles in the workforce as a problem in US society,

social historian Stephanie Coontz and her colleagues formed the Council on Contemporary Families (CCF) in 1996 (Council on Contemporary Families, n.d). This organization is dedicated to raising the awareness of sociological research among ordinary families and to providing the press, educators, and the public with the latest research from professional demographers, economists, family therapists, political scientists, and sociologists (among others). When an issue arises in public life, the organization proactively solicits experts who can write editorials or news releases about their research to counter conservative and reactionary positions. When the US census decided to allow greater differentiation in the reporting of race and ethnicity, for instance, two sociologists wrote a news report, which CCF released, about dispelling stereotypes regarding Hispanic/Latino families; this way they made their views widely available to journalists. Such work takes an activist orientation toward the news media and is accomplished through the efforts of a collective group of citizens, who come together in order to address their concerns about the direction of public debate in terms that the news media recognize. Each year the CCF holds a conference and invites scholars to contribute to its annual issue of *Unconventional Wisdom* – a report that collates findings on topics of interest within public realms, such as “Do Babies Make Marriages Better or Worse?”; “Does the College Hookup Scene Mean the End of Commitment?”; or “Do Children of Two-Parent Families Succeed More than Children of Single-Parent Families?” The work of the CCF is not without controversy, particularly as the members of the CCF sometimes challenge the work of prestigious and well-funded scholars within their own field. Yet over the years the consistency and quality of the work of its members has contributed to the organization’s credibility among journalists, policymakers, and members of the public. At the same time members have also become better at articulating how their research addresses contemporary concerns, thus making their work more amenable to external funding organizations and to arguments about the success of knowledge transfer between academics and the public.

The report on UK media and families by Sonia Livingstone and Ranjana Das (2010) offers an excellent example of an approach that begins by addressing public concerns and then goes on to reframe the debate it occurs in. After an introduction that acknowledges that media have become thoroughly embedded in the everyday lives of European families, the report opens with a section titled “What Are Media Effects?” A brief yet conclusive review of the literature ends by noting that media effects are rarely supported by evidence in a straightforward way, and that media effects depend on a complex range of factors that may be hard to predict or control. The report then moves the discussion toward a consideration of how various factors interrelate in the actual media experiences of families, effectively addressing them and then identifying the widely accepted assumptions regarding media that one finds among policymakers, parents, journalists, and others. I believe that, if we wish to gain a wider audience for our research, we need to address the issues underlying the broad concerns with media impact continuously and systematically, in our own research as well as in our collective work as members of a field of study.

Rigorous Research and the Work of Interpretation

“So, do you bring institutional review board (IRB) forms with you when you go to your friends’ houses?” a colleague joked when I mentioned the subject of this article to him. I don’t; but, as Elaine Lally (2002) noted about the use of humor, the joke highlights contradictions in the approach to research that I am advocating. In other words, “this isn’t really research, and you’re not going to claim it is, right?” – the colleague might have said. Or perhaps he might have objected that such reliance upon friends, colleagues, and students for data analysis is not a “rigorous” form of analysis. But rigor is a term that has come under debate in much social scientific research in recent years. “Traditional modernist research has focused on rigor to the neglect of the dynamics of the lived world,” as researchers Joe Kincheloe and Peter McLaren (1998, p. 287) argued. Trustworthiness, they suggested, is a more appropriate word in critical qualitative research. They advocate a comparative approach to analysis, noting that, “through their knowledge of a variety of comparable contexts, researchers begin to learn their similarities and differences – they learn from their comparisons of different contexts” (p. 287).

Being immersed in a field, becoming an expert, is part of a long tradition in anthropology that has yielded rich ethnographic analyses. That’s the tradition of anthropologists from Bronislaw Malinowski to Clifford Geertz to Michael Wesch’s recent forays into the anthropology of YouTube. United States sociologists such as E. Franklin Frazier and Robert Park have also engaged in this kind of close-up, in-depth research, a tradition carried on notably in recent years in the sociological work of Barbara Ehrenreich, Arlie Hochschild, and Harriet Pipes McAdoo. These and other scholars have argued that, in order to produce credible accounts, researchers must live in a culture until they feel they know what’s going on, and then they must live there some more, until they start to see its contradictions. The kind of knowledge that gets generated in this approach is up close and empathic, and it “rings true” or finds comparability among audiences.

Baym (2009) has similarly argued, following Montgomery and Baxter (1998), that “the goal [of qualitative research] is comparability and the ability to offer analyses that can be coordinated with others” (p. 175). For qualitative researchers, this means that the process of engaging in research comes to include not only interviews, observations, or other forms of data gathering and analysis, but continuous explorations of the larger cultural context in which the data gathering has occurred and will occur. Therefore conducting and analyzing interviews is only one part of the process of engaging in rigorous qualitative research, because, between formal interviews, we are thinking through our research questions and placing our own ongoing interpretations in conversation with other things we encounter along the way.

Hence, when we agree to present our research at academic conferences or to speak at public gatherings, we are disciplining ourselves to come up with an organized way of talking to others about what we think we’re seeing, and then we have the

opportunity to notice how others – our audiences – respond to what we say. Perhaps a key mark on the road to rigor, then, is that, if our stories are compelling, members of our audience will want and even feel compelled to talk to us afterwards, sharing their own stories or experiences in order to underscore our insights or to illuminate something about their own. In those instances we know that we have found comparability, or some way for others to relate their own knowledge (whether researched, lived, or some combination of the two) with what we've said.

But comparability is not the only attribute of rigorous research in today's context, just as self-revelation is not the only attribute of reflexive approaches. As researchers, we don't need to speak *for* those who have less access to making such contributions to public life, but we can speak *up* for them, as Cope (2008) has argued in her discussion of the role of the scholarly advocate in publicly engaged research. Moreover, as Fine (1994) has argued: "If we recognize race, class, gender, and sexuality to be socially and historically contingent, then silence, retreat, and engagement all pose ethical dilemmas. All are tangled with ethics of knowing, writing, and acting" (p. 152). Thus, as researchers, we are positioned not only to have access, but to bear the responsibility for how we will speak up, and to what ends.

I came to realize that the reason I wanted to tell Kayla's story was not to garner sympathy for her or for her parents, but to recognize the difficulties of adolescent life and of teen-parent relations, which often give a particular shape to how families experience digital and mobile media in their lives. I wanted to draw attention to how these new media can provide encouragement for young people as they foreground self-branding, self- or celebrity-building through dramatic online encounters, and the felt need to be in constant contact others, often to the detriment of their relational goals. I also wanted to draw attention to the fact that parents have largely accepted the public script that says that it is the individual responsibility of parents to nurture and support young people through these difficulties, that they do so in order to guarantee their economic place in society, and that we must not expect much in the way of public programs that will support our interpersonal or familial goals. In short, I wanted to connect the needs of both young people and parents, as expressed in their relation to digital and mobile media, with those of an economic system that says that we must promote ourselves and think of our relationships instrumentally and efficiently, and that we should overlook the fact that, throughout history, families have benefitted from strong legislative policies that make it easier to balance work and family life than the ones in place in US society today. I therefore saw Kayla's narrative as one that opened rather than closed dialogues. Sharing her narrative has enabled me to speak up for the need that all young people and the adults in their lives have for strong relationships, and for societal structures that encourage rather than hinder those relationships. A simple story like Kayla's can therefore create an opening for making connections between media studies and widespread concerns about how family structures are changing in light of economic pressures, and it can allow media studies to speak to broader issues of significant import in our collective lives.

Conclusion: On the Role of Media Studies in Public Life

As a parent who is studying parenting practices in relation to digital and mobile media, I'm constantly reminded of how much the public debate about childhood and media is structured around the "culture of fear" context typical of the US, given our culture's tendency to see things outside our immediate domestic context as threatening and in need of containment. I have enjoyed the challenge of trying to understand how to take parental concerns with the seriousness they deserve while also attempting to draw attention to the ways in which talk of digital and mobile media becomes imbricated in what Ehrenreich (1990) has described as the "fear of falling" out of the middle class (through lost job opportunities, inferior education, or too much counterproductive distraction) and in the mantra of personal instead of collective responsibility.

Many of us who enter a life of scholarly inquiry do so because we believe that we want to contribute to what Giroux (1992, p. 10) has termed "a public mission of making society more democratic." Many of us want to see ourselves as "champions for the silenced and excluded groups in our society," and thus we want our scholarship to address concerns we believe we share with members of the public. Yet at some point we, as scholars, come to grips with the fact that the world is a complicated place and that, if it were easy to solve the world's problems, someone would have already done it. So what, then? Do we decide that we should give up on research and writing and become activists? Do we decide that we need to find our teeny niche within our field and hammer away within it, as a safe career move? Do we find we need to coin a phrase so that, even if our ideas aren't new, we can be credited with starting a new strain of research? Each of these approaches seems to shortchange the possibilities for research as a contributor to social change, even in our day of more humbling assessments of the contribution of research to public life.

What seems to me to be the relevant challenge is gaining an understanding of how our very small piece of the puzzle fits into a larger puzzle, so that, whereas our research can't answer every question, it can contribute to a larger conversation. Beginning with this humbler goal of contributing to an ongoing conversation, we can then be more conscious, or more reflexive, about which conversations we want to contribute to, and how.

In today's world, scholars need to earn the right to be heard in public life. We need to consider the questions we ask from the perspective of the most pressing issues that our subjects face: in the case of the parents and young people I've studied, this includes considering how to deal with conflict and stress in family life – both with the problems that are exacerbated by digital and mobile media and with the frustrations and tensions that can be remedied through use of digital and mobile media to strengthen our connections to one another.

If conducting rigorous qualitative research has come to mean an appreciation for how our research is read and understood, or for how it "plays" among different

audiences, then taking responsibility for what it might come to mean in those various settings is an important part of our research task today. Publicly-minded research must consider how research narratives can either reinforce dominant perspectives or challenge existing discourses. In the case of research addressed to parents, I believe we can challenge the helicopter-parent concern (which is related to teen vulnerability), the story of an individual's culpability in disastrous personal outcomes, the hopelessness that might surround a story such as Kayla's, and, most importantly of all, we can reinforce the need for empathy for all young people and our support for parents in their efforts to nurture and raise their children.

NOTES

- 1 The Teens & the New Media @ Home project had its start at the University of Colorado, where I served as co-principal investigator on the Symbolism, Meaning, & the New Media @ Home in-depth interview-based research project. From 2001 to 2006 I conducted and oversaw interviews and collaborated on interpretation and analysis with my colleague Stewart Hoover and a number of excellent research associates including Monica Emerich, Curtis Coats, Diane Alters, Joe Champ, Christof Demot-Heinrich, Scott Webber, Michelle Miles, Jin Park, AnnaMaria Russo, Kati Lustyik, Denice Walker, and Dan Mercado, who worked on an undergraduate honors research project on the topic. In 2006 the project moved with me to the University of Denver, where I was fortunate to work with research assistants Rachel Monserrate, Alexis Lynn, Art Bamford, Colette Holst, Caroline Davidson, Deidre Helton, Jill Dierberg, and Nik Vukovich.
- 2 As of this writing, Kayla's Facebook profile features her cradling a bottle of vodka under one arm as she drunkenly grasps a friend's shoulder.
- 3 As a professor, I admired Caroline's compassionate response to Kayla's story, and together we talked about the responsibilities of telling Kayla's story and Caroline's own responsibilities to Kayla, given Kayla's obvious personal problems.

Media Ethnography

Thickness and Force

Matt Briggs

ABSTRACT

This chapter explores some of the contributions that media ethnography can make to theorization in media and cultural studies, while also highlighting the need for continuing methodological inventiveness in audience research. Initially the issue of “thickness” is highlighted in order for the chapter to explore the multiple practices that are articulated in and through media use. In doing this, the chapter also explores some of the relationships between identity, media texts, and media consumption by tracing the ways in which the practices, roles, and activities that make up our everyday lives both shape and are shaped by the meanings that we make both of the act of watching television and of television’s content. Second, by proposing the concept of “force,” the chapter explores one way of researching the experiential and embodied aspects of meaning-making, as well as the emotional investments and attachments that audiences hold in relation to their media. The methodological problems inherent in rendering the concepts of “thickness” and “force” are highlighted throughout, as well as the opportunities that are afforded by methodological creativity in this area. The case study is drawn from research in the field of children’s television and parenting practices.

René Descartes, writing in the 1640s, enumerated the passions as: wonder, esteem, scorn, generosity, pride, humility, servility, veneration, disdain, love, hatred, desire, hope, apprehension, jealousy, confidence, despair, irresolution, courage, boldness, emulation, cowardice, terror, remorse, joy, sadness, mockery, envy, pity, self-satisfaction, repentance, approval, gratitude, indignation, anger, vainglory, shame, distaste, regret, and lightheartedness.

(Highmore, 2009, p. 3)

I start this chapter with a reference to Ben Highmore's book *A Passion for Cultural Studies*. I do so because he urges us to think about the sheer *force* of our passions in relation to the media. "Passion," in this context, we must understand, is about "the pull and push of your connection to the social world, it is about the ebbs and flows of your feelings, the peaks and troughs of your liveliness, the pounding of your creaturely-ness" (Highmore, 2009, p. 3). Passion, then, is primarily concerned with the *force* of everyday experience: with feelings, emotions, and affects, with identity and subjectivity as irreducibly lived. It points to the ways in which culture, meaning-making, and power, the relations between self and others, are never experienced and lived out in the abstract, as so many discourses, meanings, ideologies, or representations. It acknowledges the ways in which such things always come to *matter* as lived, as embodied, as personal and passionately invested. Such an emphasis, Highmore argues, requires us to approach culture as a passionate field. It is "this sense of intimacy," he argues, that is crucial, for the force of our passions connect us to our cultural worlds: they "catch hold of us, attach us to ideas and beliefs, and in doing so 'scoop' out a space for an imagined subject of that culture" (p. 4).

A Passionate Culture

These issues are explored in a number of different ways throughout the present chapter, although my principal aim here is to think about how media ethnography can expand the ways we think about media texts, their meanings, and the practices that enable them – practices through which these texts are drawn into semiosis. My case study draws upon my research in the area of children's media culture. Here lies the unifying link between the three terms in the title – ethnography, thickness, force; for, if we want to conduct useful media ethnographies, it is not enough to call upon the somewhat vague and imprecise notions of "thick description" (a phrase borrowed from Clifford Geertz); it is also vital to expand what we include in such descriptions, to reconsider the role of researchers as we investigate phenomena, as we write, and, most significantly, to expand our intellectual approaches to media texts. The last action is imperative; for, all too often, a concern with audiences forecloses a deep and creative examination of media texts – a situation that is compounded by our narrow conceptualization of meaning-making. In putting forth this argument I will pay particular

attention to the ways in which my research has addressed issues of identity on one hand, and on the other hand the affective or *passionate* modalities of semiosis through which meanings are made and through which culture comes to matter.

Generating Thick Data

My key models in designing the research presented in this chapter were Shelby Anne Wolf and Shirley Brice Heath's (1992) ethnography of reading, together with the tradition of self-reflective media studies work – for example Matthew Hill's (2002) work of fan culture and Theresa Senft's (2008) account of webcam girls. While I don't intend to review here any of it fully (for an excellent overview, see Murphy & Kraidy, 2008), this tradition is still uneasy about clearly delineated realms of objectivity and subjectivity and seeks to capture, and indeed to benefit from, the ways in which we as researchers are caught up in what we study. Wolf and Brice Heath, for example, systematically record the first author's daughters' emergence in the world of storytelling over a total of nine years. Unlike some audience research traditions, in which we find formal interviewing, surveys, and carefully coded transcripts (Fisch & Truglio, 2001), such an ethnographic method is far less precise, employing a mixture of data collection methods. These include systematic note-taking, opportunistic scribbling on the back of whatever comes to hand, tape recording, and general background or implicit knowledge. In this fieldwork environment, the ethnographer must find productive and useful ways to reflect upon and record fleeting aspects of shared experiences and emotional connections (Wolf & Heath, 1992, pp. 9–14). As such, Wolf is fully represented in the research materials. Her presence in the ethnography is not simply that of a neutral observer. Rather she is a central and important part of the social and family dynamics she studies and observes. As I explore below, when we want to study passionate culture, the force of media experience, and its thick embedding in everyday life, such a subject position for the researcher becomes very useful. It makes the *experience* of the researcher into a central part of the project itself: something to be embraced rather than something awkward and embarrassing (and somehow to be got around).

In my own case, my “thick data” were generated at home, as I explored my son's meaning-making of preschool television programs. My first research notes were made when my son Isaac was just over seven months old. The “fieldwork phase” of the research generated approximately 400 pages of notes, which represent 126 entries recorded over a 12-month period. As thick description tries to account for the broadest possible set of relationships and practices, my observations were not restricted to the occasions when Isaac was watching television, but rather took into account anything that seemed to be connected with how meaning-making practices were being shaped by my wife Sara and me, in our roles as new parents. In this mode of fieldwork I recorded any spontaneous speech and behavior in which we alluded to

fictional characters, both while watching television or reading books and in our routine interactions with Isaac, for instance in play and caregiving. As I demonstrated above, much detail about what we were doing at the time and about our home environment and media ecology was included in my notes. The purpose of my observations was to situate Isaac's meaning-making experience of television as closely as possible in the context of his daily routines, of his relationship with us, and of his rapid physical and psychological development.

These participant observations were supplemented on 16 occasions with an audiovisual recording of Isaac and Sara or me watching *Teletubbies* together. In total, these 16 recordings amount to around eight hours of footage. In addition, I generated around two hours of footage of Isaac playing, reading, dancing, looking at the computer, and coloring. Following Marilyn Cochran Smith's (1984) protocol, all the audiovisual materials were fully transcribed. I recorded the speech between Sara, Isaac, and myself, as well as the speech between the Teletubbies and the narrator. My records also included details of the music and other diegetic sounds. I made an effort to align horizontally the documentation of media rituals with an account of what was happening as we watched, who responded how and when, and also with what was happening on the screen between the Teletubbies (for examples, see Briggs, 2007b and 2007c). These transcriptions were then placed in the context of the appropriate field notes, those that were recorded around the general time of the recording.

Thick Description and Textual Analysis

There are important methodological issues involved in the mode of research I describe here, because most audience research is designed and conducted in ways that are not especially helpful in terms of feeding back into our understanding of media texts and of the meanings that they offer (see Briggs, 2009b). While Gillespie's (1999), Hoover, Schofield Clark, and Alters' (2004), and, to a lesser extent, Georgiou's (2006) media ethnographies have endeavored to *combine* the analysis of viewing practices, family life, and media texts with the meanings that are made (that is, the process of semiosis) in such a thick and forceful analytical moment, other ethnographies – such as those by Hugh Mackay and Darren Ivey (2004), Thomas Tufte (2001), Elizabeth Bird (2003), Roger Silverstone and Eric Hirsch (1992), and JoEllen Fisherkeller (2002) – consider the texts either apart from the ethnographic analysis or not at all. Of course, there is no automatic reason to do any of these things, and the accounts provided in these analyses are full of important insights that I am not able to review in full here. Nevertheless, it is worth noting that, quite often, when audience research presents itself as using the methods of ethnography, it is built around relatively thin descriptions. Fisherkeller for example spent two and a half months in a school and conducted a survey with 50 students, all of which was

designed to enable her to select the three focal participants who inform the bulk of her research. However, these key informants were very thinly researched: there were just one home visit to a child's parents, between one and three hours in duration; two audio taped interviews with each focal participant, 12 months apart; and a single session of watching television with the informants in their own homes, together with one visit to Fisherkeller's own home (with follow-up phone calls a number of years later).

There are some very notable exceptions to this tendency toward "thin" description; such is Purnima Mankekar's (1999) magisterial ethnography. It is worth dwelling on it for a moment, for throughout the research she clearly demonstrates how television's texts and their scheduling, characters, and discourses intersect with the organization of domestic space, the ordering of time, family rituals, identities, and gender roles. In this comprehensive ethnography, the texts she considers and the method of analysis she pursues are firmly embedded in the feelings and structures of passionate culture. It is worth considering one example here, namely how Mankekar explores the ritual aspects of viewers' engagement with *Param Veer Chakra* – a hugely popular series broadcast on India's state-run television channel Doordarshan.

Briefly put, *Param Veer Chakra* told the story of members of the Indian armed forces who had been awarded the eponymous medal for bravery. The address was both personal and national; the series was taking its audience through the life of each soldier, his youth, his family, his military career, and finally the acts of heroism for which he had been honored. As Mankekar explains, while the narrative structure is similar to that of soap opera insofar as it is centered on psychological conflicts, in *Param Veer Chakra* the heroes are torn between love for their family and love for the nation. In all the cases, the force of nationalist affect prevails over the pull of family-based passions. This structure and the strong nationalist sentiments it provoked were predictable, and indeed sought after (Mankekar, 1999, p. 262). The passions that the program roused (the melodramatic pleasure, the pathos, and the nationalistic sentiments stirred up by the series) were, however, part and parcel of the ritualistic structuring of time and space in the homes that Mankekar researched. Here is her account, which is worth reproducing at length:

In the neighbourhoods where I did my research, television sets were turned on every Sunday morning, as soon as the family awoke. For the most part, people went around their morning routines with the soundtrack forming a background to their activities. But the title music of *Param Veer Chakra* functioned as a call to viewers to come and watch. Older members of the family, children, and men of all ages would stream in as soon as the opening notes of the song flowed through their home. Typically, many women would watch as they continued their household chores, but in their case as well, the signature tune would induce a heightened state of attention towards the sounds and images they would try to snatch as they went about their work. As with many signature tunes, the title music of *Param Veer Chakra* functioned both to remind viewers that the episode was about to begin and to emotionally prepare them for the narratives. As far as I could tell, on hearing the title song at the beginning of the episode,

viewers would relive the pathos of the closing scenes of the previous episode and slip into a mood of tragic expectancy as they sat down to watch that morning's show. (Mankekar, 1999, p. 265)

What I hope to demonstrate here is that there is much to be gained in terms of understanding our media culture when we see how meanings that are offered to us by *specific* media texts are drawn into semiosis in the complex practices, spaces, and relationships of everyday life. Indeed, as Jenny Kitzinger (2004) has argued, if the media have any influence at all, it is only through these complex audience activities, and it is the relationship between the three that we should endeavor to understand. In this way we start to see, in the illustration above, the issues of the thick embedding of practices, of the force of the media, of and the way in which they enter our passionate culture. As I detail in what follows, Isaac's introduction to television has to be seen in relation to a whole range of parenting practices, to the daily organization of our lives as parents of a pre-school child, to a wider set of discourses about childhood, parenting, and television, and to the institutions that govern them. As I have argued, such a thick description also needs to be set within accounts of how we felt about these things with our passions: what it felt like to watch, what our hopes and fears, our pleasures and frustrations were; how watching television with Isaac made an impression on us, in our minds, and on our bodies.

Accounting for Force

While the principles of thickness and force are designed to overcome the separation between "text," "context," and "response," the final accounts have been presented (in their published form) as narratives rather than in the somewhat ossified form of transcriptions, which is significant in trying to capture the feelings and affective forms of a passionate culture – that is, the ways in which the media "impress" upon us. But this was the case with the published narratives only; the conceptualization and *preliminary* analysis emerged, however, from the behind-the-scenes process of transcribing, which calls for creating distance from fieldwork experiences and observations (the objectification of a table, with the clarity that this provokes). These initial analyses were subsequently *developed* and rewritten in narrative form as I watched the videos again. It was an evocative process, which brought back to me – and, it is hoped, evoked for the reader – a sense of the force of these encounters, of their thick entanglement in the multiple contexts of passionate culture. There was much going back over the materials and much rewinding (and at least as much frustration with how long it takes and with the sheer size of the undertaking). Sara would come into the study at times – to watch, to remember, to feel. Her comments (of a personal nature) have found their way into the analysis. Many times a passing phrase, a tone of voice, or a glance revealed a lot; they drew my attention to things

I had missed, forgotten, or thought previously unimportant. Participating in my fieldwork, she was pointing out details that were hidden in the thickness of context, details that invariably brought me back to the *experience-near* nature of force (when I was tempted to stand back too far) through the *experience-distant* nature of concepts (Geertz, 1983, p. 57).

Valerie Walkerdine's (1997) ethnographic research is useful here, for she suggests that such a commitment to thickness of context acknowledges the interpersonal (or *passionate*) space occupied by those involved in the research act, and that the problems with challenging the truth claims of ethnography have more to do with not taking on board our feelings in a systematic manner than with denying having these feelings in the first place. Instead of seeking to banish the force of passionate culture, she seeks to undermine the division between objectivity and subjectivity and to disrupt the idea that the subjective is something that "interferes with, biases and distorts the truthful view of the object of study." As she continues:

I will suggest that it is an impossible task, to avoid the place of the subjective in research, and that, instead of making futile attempts to avoid something which cannot be avoided, we should think more carefully about how to utilize our subjectivity as a feature of the research process. (Walkerdine, 1997, p. 59)

Against the tenets of positivism, Walkerdine's position requires us to take seriously the *force* of our own personal experience as an analytic category, while recognizing that, as thickly embedded or positioned subjects, we have the ability to grasp certain features of media practices in more adequate ways, precisely because we are dealing with experiential aspects of knowing.

Introducing Isaac

Isaac is just 8 months old, it's Sunday afternoon, and his mother, Sara, has just switched on *Teletubbies*. They have been playing, there are toys scattered over the floor: reds, yellows, greens, and blues. Isaac looks up at the camera, grinning, while I film the moment. This is nothing unusual, as we are always filming him in order to capture – or rather to produce – our family memories:

"Is that the camera?"

"Have you got your Po?"

"Say hello . . . hello, hello!"

Isaac is sitting on the floor playing with his new Po doll; we have just returned from shopping and he is very pleased with it, it's a new toy, but he continues to chew on a plastic building block (dribble running down his chin). *Teletubbies* starts; he hears

the music and looks around to the television. This is a real effort, as he is sitting with his back to the television (he has to twist right around); but it's worth it.

Joining in on the introduction, Sara shares Isaac's pleasure as the Teletubbies jump out of their holes, one at a time. This is a ritual: Sara and Po join in on our side of the screen: "Huh, What's that? Oh, Po."

NARRATOR: One.
TELETUBBIES: One.
SARA: One.
NARRATOR: Two.
TELETUBBIES: Two.
SARA: Two.
NARRATOR: Three.
TELETUBBIES: Three.
SARA: Three.
NARRATOR: Four.
TELETUBBIES: Four.
SARA: Four.
SARA: Do you want to turn around so you can see.

As they finish, Sara picks up Isaac and turns him around, sitting him in her lap, and she sits Po beside him, saying: "Look, Po's watching." All of a sudden the theme music bursts out, breaking its restraint as the Teletubbies dance and introduce themselves. Meanwhile the periscope announces "time for Teletubbies, time for Teletubbies"; as they do so, Sara picks up the Po toy and makes it jump to the rhythm of the music:

NARRATOR: Tinky Winky.
TINKY WINKY: Tinky Winky.
NARRATOR: Dipsy.
DIPSY: Dipsy.
NARRATOR: La La.
LA LA: La La.
NARRATOR: Po.
PO: Po.
SARA: Po.
SARA: Po's dancing look!
TELETUBBIES: Teletubbies, Teletubbies, say hello.

The Teletubbies turn to face us, waving "Eh oh!" As they do so, Sara waves Isaac's arm in return; he looks delighted. The singing and music continues and Sara makes Po dance along with the music again:

NARRATOR: Tinky Winky.
TINKY WINKY: Tinky Winky.

NARRATOR: Dipsy.
 DIPSY: Dipsy.
 NARRATOR: La La.
 LA LA: La La.
 NARRATOR: Po.
 PO: Po.
 SARA: Po!

As they play, Sara makes Isaac kiss Po to the rhythm of the music; he grins broadly again, rocks forward slightly, his eyes are bright with wonder: he is completely absorbed in this ritual. Sara and Isaac and Po all hug together on this side of the screen, while the Teletubbies hug on their side: "Teletubbies, Teletubbies, big hug!" "Big hug ahhh"!

A few moments later the windmill appears and the Teletubbies run through the hills to look. We cut to the periscope and Sara asks: "Hu! Where have they all gone?" She has preempted the part of the periscope, which repeats after her: "Where have all the Teletubbies gone?" The dialogue continues as Sara asks again "Where are they?" and dances Po up and down: "We know where Po is don't we!"

Po had a special significance for us. When we first started watching *Teletubbies*, we somehow engineered an affinity between Isaac and Po. I first noticed this when Isaac was 7 months old, as I recognized how much they resemble each other. Quite by chance, he was wearing a red baby-grow; and he seemed to act and feel like Po, with his growing social feel, his mobility, and his curiosity. As we watched, the "littlest one" produced a passionate response: I picked him up for a cuddle (I just had to). Squeezing him tight (close to tears) I asked: "Are you my little Po?" Perhaps the intensity of the emotion (in the mind) is matched by the affective wave (a welling-up) that rises through the body; the two seem to express each other in a dialogic expression of feeling. A few days beforehand, Sara had picked up Isaac, asking: "Do you want a cuddle? Are you Tinky Winky? No, you're Po because you're red." She cuddled him saying "Big Hug," adopting the Teletubbies' intonation. Her affective cadence in imitating the Teletubbies seems to reproduce something of the feeling that lies in and behind a real hug.

A few weeks later Isaac was attracted to dolls in the *Tomy, My First Teletubby* range. Sara suggested that we buy him Po, "because she is the smallest." It was actually two weeks later that we bought him Po. Isaac was miserable, having had a tummy bug, and Sara told me he needed it "as it will make him feel better." When we arrived back home, she suggested to Isaac that he could watch *Teletubbies* with Po: "Wow! Yeah! You going to watch with your Po!" Soon after this Sara started referring to Isaac as "Pissey Po" ("hello my little Pissey Po"). One morning Isaac brought Po into bed with us. Sara picked up Isaac with Po and gave them a big hug: "Ah, it's my big Pissey Po with his little friend Po, are you my Pissey Po?" We laughed sentimentally at his red baby-grow, "ah he looks like Po," and I surprised myself by adopting this "voice" (an inflection) in those moments when we were being most sentimental.

On Being a Parent: Thickness and Force

As a game, Teletubbies was “easy,” in the particular sense that it gave us something to do. It was an *activity* much like those where we interacted through books or toys. “It was easy”: this sounds perhaps a little too frivolous (or lazy, perhaps negligent, inattentive): like I wasn’t trying. I feel like I have to defend myself against this “easiness” and against the accusation of neglect, which is so readily assumed when one lets a child watch television. As I write, as I present myself to the reader as a parent to be scrutinized, I find myself feeling apprehensive, self-conscious perhaps: my cultural capital is on display. I will be judged not only as a researcher, but also as a parent. I need to capture what I mean by “easy,” and to find the root of my unease. The question emerges at a point of tension where I am reluctant to speak, to reveal myself. I get a glimpse of the culture that envelops me, of the forces that shape me: it is this place from which I can speak.

Our ease with the Teletubbies game was not due to lack of attention. It was not a lack of care, nor was it an abandonment of Isaac to the screen. Rather, when I say “easy” I mean it to suggest something about the way in which the text *offered a structure for interacting*, just as turning the pages of a book or playing with building blocks do. I don’t feel uneasy about these: I feel proud to display them; I congratulate myself (“what a good parent I am”). No, the unease is specific to television. I was busy, and at times I found it hard work being with Isaac, keeping him (and myself) entertained, while I was feeling that I had other work to be getting on with. I felt that, to be a good parent, I should have to attend to him constantly: to engage as much as possible, to be attentive to every manifestation of his development, and to recognize, nurture, and celebrate his growth. Television is often positioned against the discourse of good and dedicated parenting, and against the dispositions that responsible parenting seems to demand. In some versions of this discourse, subjecting one’s children to television is seen as tantamount to abuse (Buckingham, 1997).

But parenthood is fraught with contradictory demands, and I’m not so sanctimonious as to hide this: I needed things to do with Isaac when my capacity for unstructured play waned, when I tired of being attentive, when I was frustrated, and when other things were on my mind. Being with a toddler is hard work. There is a whole support network of institutions, formal and informal, commercial or otherwise, which acknowledges parents’ struggles and taps into the interpersonal dynamics that are produced – whatever they may be. The culture industry, in which *Teletubbies* is a major player, is just one part of this field. As such, *Teletubbies* can be seen as less of a text and more of a signifying practice: at once a set of discourses, a discrete text to be watched, and a material practice – but also a set of affordances to be taken up and used, to be drawn into semiosis (Kress, 1997). In short, media rituals precipitate a complex set of meanings, some of which were socially given while others were produced as we played. My questions are: Just how do media intersect with culture, and how is one to account for this confluence? These are questions of thickness and questions of force.

Descriptions: Through Thick and Thin

The phrase “thick description” was originally proposed by the anthropologist Clifford Geertz in his famous book *The Interpretation of Cultures*. For those of us who are not trained anthropologists (and I take it that the majority of this book’s readers fall into this category), this can be something of a slippery phrase, not least due to Geertz’s somewhat elliptical style of writing. Geertz suggests, for example, that thick description should be concerned with the “webs of significance” in which we are suspended (which we ourselves have spun), and he likens it to reading a manuscript: “foreign, faded, full of ellipses, incoherencies, suspicious emendations, and tendentious commentaries.” To make matter worse, such a manuscript is not written but finds its form in the “transient examples of shaped behavior” (Geertz, 1973, p. 10).

Rather than endlessly working through Geertz’s concept of thick description and deconstructing what he meant by it, I think we can begin to see what lies at its basis in what has been written above. In this account, the rather mundane practice of watching television with an infant is situated in a much wider nexus of cultural practices. We see the ways in which *Teletubbies* is not so much a discrete program as a part of wider play and parenting practices, a part of the routines and habits that structure our day and perhaps get us through it. In this we see the ways in which the text is perhaps best approached as a game rather than as a set of meanings; something that has implicit roles, or a set of rules if you like (Briggs, 2007b, 2007c). *Teletubbies* is also something that articulates a set of discourses: that the program has to be educational, that the romance of childhood, or play, should be made useful (Briggs, 2006). In this capacity, as I have argued elsewhere (Briggs, 2006, 2009a), *Teletubbies* says more about the construction of the “good parent” than it does about the child. As a signifying practice, it was an almost constant form of address, and one of several trailers made claims about *CBeebies*’ ability to “release your child’s potential”:

Mozart wrote his first composition at four –
So what ever your child’s potential, we’ll always encourage it:
CBeebies, helping little ones discover big things.

At this confluence of identities and feelings (passions), institutions and discourses (structures), we can see, perhaps more precisely, Geertz’s measure of an adequate thick description. This must be, mainly, a description of meanings, the practices and texts that generate them, and their significance as they unfold in the lives of those we seek to study. But it is also, at once, a case of seeing how these meanings are structured, lived out, and experienced; how they feed back into each other, are resisted, are embraced, are reproduced. But how, then, if this is the case, should we generate such thick and forceful accounts? How do we *render* passion?

Writing Passionately

This brings us finally to the question of representation: How shall we write from the standpoint epistemology of thickness and force? How shall we order the ethnography? With what signature should the work be signed: how do we render, not only thickness, but also the force of a passionate culture? Since the poststructuralist crisis in ethnography and the so-called “interpretative turn” that ensued in the 1980s, these issues have come under increasing scrutiny. James Clifford notes, for example, that ethnographic writing is fictive like a production, or that its creations are “true fictions.” On this construction of writing, the oxymoron (or contradiction) deliberately suggests the partiality of the claims we make about our ability to represent truth. The realities we produce are dependent, to no small extent, on the language and rhetoric used in the thick description, on the conceptual frameworks employed, on the institutional contexts, and on the honesty and skill of the ethnographer (Clifford, 1986, pp. 6–7, 25). Hence ethnographies are necessarily *partial* in both senses of the term: they are dependent upon the multiple positionings of the ethnographer there in the field, and they are dependent on the situated nature of the interpretation (the ethnographic text) there in the context of the institution and of the questions that have been asked – *and the questions that it is permissible to ask*.

Concerns raised about the truthfulness of ethnographic accounts, such as the ones produced here, miss the point. While what I recorded was true in the ontological sense that it happened (that I haven’t made it all up), epistemologically the issue is less secure. There are now different sets of issues: how could one hope to verify this? Is this significant? Is it ever possible? Would someone else in the room produce a similar account, use the same words, notice the same things, and consider them to be significant enough to deserve being recorded? What would have been lost in the research materials if I had limited myself to the observable and the verifiable? To argue that my field notes could be invested with the same authority that positivist data have would be a methodological sleight of hand, as Geertz puts it. However, it would also deny the particular form of writing that thick description demands (Geertz, 1973, p. 23).

In suggesting this, Geertz is addressing the question of how to write – the question of what scriptural practice is suitable for rendering comprehensible the thickness and force of lived experience. I want to briefly consider the challenge of representing lived experience, as it is an important and overlooked aspect of writing, both in textual analysis and in audience research. I think that Roland Barthes’ work is particularly interesting (and no doubt challenging) in this respect, for this is a question to which he constantly returned in his later writings, most of which deal with the passions. Barthes deliberates, variously, on the pleasure of the text (1975), on the nature of love, and its expression in discourse (1978), on desire (1992b), memory (1992a), loss (1980), and the self (1977). These writings are marked by a very different style from that we normally find in criticism. They are non-linear and polyphonous. They

have no single points of entry. They are written as a number of fragments. Indeed, most of this work is arranged numerically or alphabetically. Since the scriptural practice is non-accumulative, these texts only make sense if they are read in a fragmented and decentered manner. While as Barthes suggests, fragmented scriptural practices upset the customs of reading in our society (1974, p. 15) and create particular challenges for the reader schooled in academic writing, such forms of writing that interrupt narrative norms do seem to convey a sense of forceful affect, as well as the inflections of lived experience.

Barthes' (1992a) posthumously published essay "The Light of the Sud-Ouest" accounts for this affective prose quite beautifully. There Barthes reflects on his childhood home in Bayonne. To know one's home, he suggests, to know one's place in the world, to recollect the past, to understand one's present, "to read" all of this and to say something of significance about it, is to *read the cultural through the self*. Such an interpretative practice demands that we *learn to know* through the confluence of mind and body, through memory and affect: "to perceive it in terms of the body and of memory, in terms of the body's memory. I believe it is to this vestibule of knowledge and of analysis that the writer is assigned" (pp. 8–9). I read Barthes as arguing that culture, mediated as it is by memory and perception, is known not only through our thoughts (of whatever kind), but also through the *sensations they afford*: that to know is also to summon up something of the experience of an event, and *then to evoke it through language*. We need a vocabulary and a syntax that can render the *sensations* that experience affords: "odours, exhaustions, sounds of voices, errands, changing light, everything that with regard to reality, is irresponsible and having no meaning except to form, later on, the memory of lost time." This, he argues, is one way to understand the cultural through the self; for "these inconsequentialities, then, are a kind of gateway to that huge region with which sociological data and political analysis are concerned" (Barthes, 1992a, pp. 7–8).

Inconsequentialities

The Teletubbies look like soft toys (either teddy bears or dolls); and, like many other children, Isaac had a Po and a Tinky Winky, along with a family of assorted soft toys. Often these would accompany his viewing. They were part of a wider passionate culture, and, as such, their provenance (a singularity; a personal genesis; a history) endows them with meaning. These connotations tell of the semiotic materiality of the Teletubbies, of the closeness, the warmth, the affection of our passionate culture. As we (Isaac, Sara, myself) look, we experience their touch: the lighting, the perspective (the *mise-en-scène*) highlight their materiality; the signifier transposes from sight to touch (it is synesthetic). *The gaze has a texture, it has a temperature*: they look soft: we feel the cuddles, the "big hugs" of our passionate culture, as we cuddle together: Isaac, Po, myself (it could be *Wibbly Pig* or *Pooh*, the principle is the same).

This is also a matter of characterization: the well-observed movements of the Teletubbies, their regular somatic displays of pleasure, of awe, of curiosity, of excitement. These are readily recognizable: *this, Isaac might say, is what my body feels like* (its forms of feeling) when I run, jump, giggle, sing, hug, bounce, fall, roll: when I know what is coming, when we jump up in peek-a-boo: feeling is drawn into semiosis. We recognize the passions that accompany experience: the simple delights of hiding behind a hill, of jumping up, of waving (“hello”); of greeting (“big hug”); of repetition (doing this again and again, so I know what it will feel like). This matches (it expresses) the rhythms of Isaac’s body, the rhythms of his play. It amazes me, he wakes at seven after almost 12 hours of sleep, plays until mid-morning with an intensity I can barely keep up with, and then, exhausted, he is back to bed for two hours:

Running across to the windmill full of expectation: holding hands with my friends:
my tummy lights up: wow!

The Pleasures of Sound

These are pleasures of speech, of rhyme, as I call out “Tinky Winky, Dipsy, La La, Po.” The television lights up “zing, zing, zing, zing” as I shake my legs: a tingling feeling, tingling (iridescent) with excitement and anticipation.

The Polyrythms

Each character has a motif, often they seem to be superimposed: a cacophony of movement, of sounds and bodies; each appears on the hillside:

Tinky Winky with his handbag,
Dipsy his hat,
La La her ball,
Po on her scooter:

They greet us, with a joy and an enthusiasm (an eagerness) that match their movements:

“Hello!”
“One day in Teletubbyland all the Teletubbies were very busy.”
“Very busy!” comes the Teletubbies’ reply.

They never stop:

Tinky Winky marches . . .
Dipsy, she dances . . .
Baby Sun smiles and coos . . .
La La bounces the ball.

Po rides the scooter – but the excitement is too much for her (for her body), she falls exhausted onto the floor:

“Po tired.”

“So Po decided to go and have a rest.”

“Po rest,” she replies, as if to affirm: off she runs to bed.

“Go to sleep, its time to rest, go to sleep, la le la, its time to go to sleep,” the lullaby gently soothes. “Ah, Po’s asleep.”

A short rest and all is well; ready to play: *again, again, again, again . . .*

Passionate Bodies, Passionate Minds

One way of thinking about these issues of affect, as this type of embodied expressivity, is to conceptualize the body as a core that *grounds subjective experience*. As Barthes argues, we come to know as much through our bodies as we do through our minds (Barthes, 1992a, p. 7). Our bodies, however, are never singular but always dispersed: located in an environment; a body of experience, and an experiencing body. For Barthes, at once “a digestive body,” a “nauseated body,” and a third body “which is migrainous”; others that are “sensual, muscular . . . humoral”; still another, which is *emotive*, “which moves, is stirred, depressed, or exalted or intimidates.” And there are more: the “socialized body,” the “mythological body,” the “artificial body,” the “prostituted body.” Finally, “local bodies,” which is to say (in a different sense) ecological bodies: “A Parisian body (alert, tired) and a country body (rested, heavy)” (Barthes, 1977, pp. 60–61).

As Susanne Gannon writes, for Barthes the body is a source of knowledge: “but it is unreliable, fragmented, and dispersed in time, not a reliable reflection of any coherent or stable self” (Gannon, 2006, p. 481). This is precisely the point – and the difficulty – in autoethnography: not to make experience posit a stable “I” in its name, but to account (with the aid of concepts) for a phenomenology of the self in process: a self who experiences an affective (embodied) subjectivity in concert (or in dialogue) with others. I take this to be a question of thinking about the phenomenological and affective nature of the experiencing I; of what Ulrich Neisser (1988) calls the *ecological self*. In Neisser’s account these multiple bodies provide a phenomenological locus of being: “I am the person here in this place, engaged in this particular activity.” This can be thought of as the experiential self of agency and corporal affectively: the *embodied self in a particular environment*: the self in what I can see, do, hear, feel, touch and control: the “I who can do this,” the “I of coordinated movement,” the “I as distinct from the environment” (Neisser, 1988, p. 36).

As such, the ecological self is radically contextual and must be phenomenologically conceived: to move is to perceive consequences, both optical and kinetic. The

perception forms an awareness, a nascent self emerging from the earliest moments of life. This is a coming into being as “bounded,” “articulated,” “controllable”; “by what it can see, and what it can do.” The ecological self is directly perceived, rather than as an object of thought (pp. 39–41). This is *vital*: the self is never disembodied. We always *experience* from a location: from a *position*. Subjectivity is *situated* in such an account. It must be: it is the nature of our embodiment in time and space (a lived, an ecological context).

This is important not only in terms of thinking about embodied experience, but also for thinking about the self in relation to the world. Taken as such, the ecological self can be thought of in the following ways:

- *the self of agency* (of authorship over actions and non-authorship of others – of being done to, of volition and repeatability: “this happens”);
- *the self of coherence* (of a physical whole which is bounded: not the shards of the fragmented self but a unity formed by a locus for integrated action);
- *the self of affectivity* (who recognizes and remembers the patterns and traces of actions – who feels);
- *the self who has a history* (it has a sense of enduring: “it goes on being”).

Through practice, the ecological self *comes into being* in a dialogue with others, with objects, and with self-experiences: “the self is not an experience of being but an experience of becoming, a process of improvisational co-activity with potentially infinite possibilities for self discovery” (Fogel, Koeyer, Bellagamba, & Bell, 2002, pp. 193–194). As this account suggests, the ecological self is performative. It is enacted and engaged, which is to say brought into being and preformed through physical play. The text affords this: there in front of the television as Isaac explores the corporeal, the mediated (simulated), and the material worlds: singing, dancing, waving, joining in, chewing toys, newspapers, pulling cables, blowing “raspberries,” insisting on feeding himself, crawling, tumbling, being hugged, bathed, and changed. *He is a self with a physical potential for action*. His body is drawn into semiosis experientially; it is felt through forms of feeling in physical and sensual play. While this is pragmatic (Isaac intrudes into the semiotic ecology), it is also pedagogic: Isaac *observes, he sees, he listens, and watches*. There is recognition: “I can do that,” “I can feel that.” This is experiential, which is to say affective *as well as* cognitive. These experiences, this ecological self, are cause for celebration: the self is reflected back quite literally by the Teletubbies, whose ebullient characterizations find their origin in Isaac.

The Ecological Self

Isaac is 12 months old. He watches quietly, I sit on the floor behind him; he is having a mid-morning snack (juice and a biscuit): “would you like some daddy” he seems

to say as he turns around. He pulls himself up against me, offering the biscuit into my mouth “umm, yum yum, thank you, thank you very much: it’s the rabbits, it’s the rabbits, wow!” (I revoice *Bugs Bunny* as the falling refrain sounds in the background). Isaac almost supports his own weight now, and he looks straight into my eyes – our bodies move in concert as I apply just enough pressure in just the right place. This is familiar, sedimented: we both take pleasure, him in standing, and me in “how well he is doing.”

Tinky Winky appears from behind a clump of talking flowers. He waves to us as I ask Isaac what he is doing. I sing along, with the ditty “do do tahh, ohhhh, what’s that Tinky Winky doing?” He says “Eh Oh” as he looks at us from the diegesis. He waves again. I return the gesture by waving Isaac’s hand: “Eh Oh.” He seems to say hello himself, in a vocal display of pleasure: “yeeh, yeah, yehhhh, yeahhhh.”

The narrator begins his commentary: “one day in Teletubbyland, Tinky Winky stood on one leg.”

This is no monologue – we all take turns responding:

MATT: Standing on one leg!

TINKY WINKY: Stand on one leg!

Isaac is kneeling on bended knees, as we talk he launches himself forwards; sensing the change of tension, *anticipating his movement*, I pick him up into a standing position: our gestures are coordinated. Just as Tinky Winky prepares for his physical play, I literally scaffold Isaac (to support, but also to prompt):

“Can Pisse do that?”

“Can Pisse stand on one leg?”

“Look at that! Can Pisse stand on one leg?”

A drum roll sounds in the background; it marks, with perfect timing, Tinky Winky’s bodily performance and Isaac’s efforts at standing: as he leans against me, propping himself up, I lift one of his legs in the air, saying “oohhhhhhhh yeah!” (I finish on the last flourish of the drum).

“Again, again,” Tinky Winky enthusiastically signals his pleasure jumping up and down. “Again, again”: he repeats the trick.

Just as he stands up on his own, lurching forward I say: “Can Pisse stand on two legs?” Wobbling he grasps the neck of my t-shirt. As he swings around, I pull him in for a hug: “Yeah clever boy. You’re going to stand on two legs, you try, like Tinky Winky.”

In two weeks Isaac will be walking on his own: then he will jump up and play peek-a-boo with the Teletubbies: launching himself upwards (expressively): “BOO!” Isaac plays alongside and with the Teletubbies. Sara and I scaffold Isaac’s experiences and, as we assume the implied role, we mediate the text: we draw it into semiosis. These rituals punctuated our patterns of relatedness. In this textual play we take pleasure in our bodies. Isaac explores his body’s potential and the subjectivity this engenders. Textual and corporal play works in tandem *with the other*, for the

ecological self is also the self who anticipates, whose body and emotions are shared. A self “in concert” with the other: who literally dances (embraced, as we have seen). Playing peek-a-boo, the familiarity of touch and of being held, the regularities of caretaking (“the way mummy changes me,” “the way daddy hugs me”); laughing together, watching *Teletubbies*: these are totally social experiences that are embodied, but routine. In short: they are *habitual*. In peek-a-boo, these interactions excite Isaac in a crescendo of joy and suspense; they are sedimented, however, as they are anticipated; the body knows and expects what is to come, it is prepared, and there is an affirming self-knowledge in this: “this is me, I carry on.” Through this play, Isaac is engaged in vital self-experiences (Stern, 1985, pp. 101–105).

Here I am trying out new ways of thinking, of how affect is related to the text beyond the identification of emotional responses or “pleasures” – a much too general term. By doing so I have to take my lived experience as the epistemological datum. It is not enough to rely on the objectively identifiable (to turn it into a text: to read it). This may explain something of the poetics of the act, of what can be seen on the tape; but this is not isomorphic with the erotics of the act: it fails to capture it, it exceeds it, it speaks a different language – or rather it accompanies it, like another semiotic register. In essence, this is the nature of the passions; for, while they flow and circulate, while they are both subjective and shareable, they are not readily objectified, recorded, and textualized. As an issue of lived experience, passionate culture can only just be spoken of, only just represented. The representation will always be but a poor approximation. We need new vocabularies, new ways of writing, and new ways of thinking to capture this.

Thickness, Force, Power

To conclude the research, I want to return to these issues now, insofar as they can be related back to what is arguably the central issue in media studies: *the question of power*. I do so by developing a theme that has emerged at several points in my argument and that links the questions of lived experience, affect, and power (pedagogy). As I have suggested, I think these can be profitably thought through as an *affective pedagogy* (Briggs, 2007c; Highmore, 2009). This is important; for thinking through the relationship between affect and cultural reproduction seems to be an important way of rethinking the rather sterile opposition between “audience pleasure” and “ideological effect.” This is often conceptualized as an opposition between *power* (the text) and *resistance* (the audience). Important as these questions are, they seem not to relate to the wide range of meanings that are in play as semiosis is generated, and often they are posed as high-level conceptual issues rather than as empirical questions to be pursued (e.g., Fiske, 1987).

In place of this power/resistance paradigm, I return to the perspective of passionate culture and ask a final question about the yoking of play, affect, and the pedagogic. To

do so, it is useful to look at Elspeth Probyn's (2004, 2005) work, for she suggests that one important function of affect is to make us care about things. However, affect does not only make us care; it suggests *ways of caring*, and *different ways of being involved*. Here, as I have argued (Briggs, 2007a), affect is the meeting of the mind (the psychological) and the body (the physiological). In such a way Probyn argues that affect creates what can be thought of as "the mindful body": *an embodied subjectivity, which is directed toward the world in a specific and affective modality of interest* (Probyn, 2004, pp. 26–27).

The Mindful Body

Teletubbies was habitual: it was routine. Childcare is work, and watching television, for Sara and myself, was part of this childcare. However, this work of childcare can be playful. As work and as play: once one accepts the ambiguity, one can enjoy the game of playing along while still going through the motions, subjected to its logic and to its repetition (both the daily routine and the fixed form of the text): *hellos, tummy tales, dancing, magic windmill, goodbye*. Play and non-play are not to be sequestered into separate corners of experience. While the routine of childcare is enjoyable, often rewarding, it is also a responsibility. Sara and myself were positioned here as responsible parents (habituated, as I have argued), and I am positioned here in a double articulation, as a responsible parent *and* as a researcher. My cultural capital was clearly on display, to be scrutinized – by myself and by others. In this way I was a subject of discourse; I positioned myself in relation to it: I habituated myself (see Briggs, 2006, 2009a).

In respect of this habituation, Isaac, as we have seen, certainly wanted *Teletubbies* on, again and again. It was a regular part of the day, a routine: it was *habitual*. The program was one means through which our routine was managed and through which Isaac became socialized into the abstract structuring of time (Davis, Buckingham, & Kelley, 1999). Isaac didn't always need to go to sleep after *Teletubbies* at 10.25, but I needed him to do so. I had other things that needed doing: I needed that hour or so, that space, that time. In this respect, while he wanted to watch, I also wanted him to watch. He was being "stitched" into culture here, in the abstract structuring of time, of space, and of the uses of his body (Foucault, 1979). In the broadest sense, this was an affective pedagogy: the playful and *affectionate* regulation of his body and of his time. Here we see the channeling of his somatic energies (his passions) toward adult needs and desires, which is to say cultural need and desires. He was learning through play.

An Affective Pedagogy

Isaac is now 16 months old. For once it's a lazy Sunday with no rushing around. We are having a long leisurely breakfast in the kitchen. I'm enjoying this quality time.

Throughout our meal Isaac plays with a *Teletubby* magazine (not designed to be “read” but to be played with: colored in, ripped, talked about, shared). Finished, we move into the front room for *Teletubbies*. *Tweenies* is approaching the end, and Milo, Fizz, Bella, and Jake sing and dance the conga. Sara asks Isaac: “Do you want to dance?” He refuses (he is tired, he complains). He walks across to mummy, climbing on her lap, sucking his thumb, one hand behind his ear (his comforter). I interpret his feelings for him: “No, I need a cuddle.” I think that he will go up to sleep as soon as *Teletubbies* has finished. Perhaps I shall do some work, I have marking to do: so much for my leisurely Sunday.

The *Teletubbies* trailer begins. It is announcing what is to come and Sara sings along with the music: “Tinky Winky, Dipsy, La La, Po.” She gently rocks to the rhythm, matching it with Isaac’s mood. After a lull, the familiar music starts again, and Isaac walks over to the television. He picks up a small red basket on the way and hums along to himself, as he pokes it with a white stick (of the type to which balloons are attached). What is “to hand” is drawn into meaning-making here: he shakes it up and down (rather like a conductor’s baton), saying “hello” to the *Teletubbies* as they appear in their house:

ISAAC: It’s there.
 SARA: Who’s that!
 MATT: Look! Look at that!
 ISAAC: Yeah, Yeah! It’s De! Da.
 MATT: You saying hello!

A little later the *Teletubbies* march off to the clarion call of the tummy tale. Isaac matches his excitement to theirs: he recognizes the move in the game and vocalizes in anticipation and involvement. The progressive marching music continues as Tinky Winky, Dipsy, La La, and Po turn and look up at the windmill. Amid their gasps of delight and wonder Isaac shouts out “Daaaa!” and I respond excitedly “What’s it going to be?!!” This is both a question about my pleasure and a request for an answer. Now he will learn about the world. Isaac’s reply is a physical response: he runs across to the television and touches the screen as the *Teletubbies* hug (“they love each other very much”). The pedagogic, the ludic, and the passionate converge: a weave of voices.

To play the text with Isaac is at once to submit to childish pleasures and to share them with him, but it is also to teach him, not only the lessons of the text, but also *how to make his pleasures useful*: how to harness his passion. In this way we watch with him; we teach him how to respond (scaffolding his involvement): here you join in, let us know if you like it, call out, jump up, sing, talk, and dance: these are our friends. The mood (the inflection, the intonation) of this passionate voice is “wow.” It harnesses his interest, it becomes at once its heuristic partner: “How?” The emphasis here is on the pedagogic: *on the sharing of interest*. Our bodies become mindful.

This is a pedagogy that is based on affect as much as it is based on ideation. This semiosis translates across different semiotic modes, from touch and sound to sight:

it is synesthetic. This is to reverse the common critical position (a cultural pedagogy): Isaac isn't *making sense* of the Teletubbies *as characters*, he isn't building up a complex portrait of psychological and cultural traits (the semic, the cultural, and the symbolic codes) in order to explicate a plot (to make sense of the story): he doesn't "read" or "decode" the text in order to make sense of the world, himself, and others. Isaac doesn't ask what the text really means; what (by allegory) that stands for: "What is the social message, the moral?" Later he will attend to these issues and explicate the text in this way (among others). The texts he will watch will address him with this pedagogic voice. His culture will teach him to do this kind of reading (at school, where ideation is the final goal of the text) (Turnbull, 1998). At 18 months, this is not a form of cognition available to Isaac: to critically approach the text *only* from this position would be to ignore the dynamics of passionate culture and the "impressions" of the text. Here research will need to find ways of asking what happens when feelings and structures meet in passionate culture, when they are yoked together in the thickness and force of everyday life.

Nomadic Scholarship

Translocal Approach to Audience Studies

Fabienne Darling-Wolf

ABSTRACT

This chapter reflects on the challenges of developing a translocal approach to audience research. After providing a short critical review of the literature outlining the benefits of such an approach from a theoretical point of view, this essay goes on to discuss the difficulties arising from the attempt to develop an understanding of audiences' experiences in different environments informed by a truly comparative lens. An approach, in other words, that considers how the experiences of audiences in different parts of the world relate to one another. Informed by the author's experience as a white European US-educated scholar employed by a US university – a scholar whose work has extensively focused on Japan, but who is also significantly influenced by her French citizenship and familiarity with francophone academic literature – the chapter considers the practical implications of conducting fieldwork in multiple cultural contexts, as well as the consequences of approaching research with a keen awareness of our (and our informants') complex identities.

In his seminal work on the hybrid nature of contemporary cultures, Argentinian Mexican cultural critic Néstor García-Canclini (1995) describes the anthropologist as entering the city by foot, the sociologist “by car and via the main highway,” and “the communications scholar by plane” (p. 4). Much of the corpus of communication

research in the United States seems to justify this characterization. The hefty bodies of work on political economy and transnational media flows, on the transmission and processing of information, or on the politics of media representation are typically concerned with drawing large-scale outlines of media production, content, distribution, and/or reception processes – in other words (and to continue García-Candlini's metaphor), with producing an aerial view rather than a detailed map of the city. In fact, one wonders at times if the communication scholar enters the city at all.

While such investigations have certainly contributed to our understanding of the role of communication in society and culture(s) – and while I do not mean to suggest that we stop producing such research – their macro-level perspective limits their ability to address the realm of reception and, more specifically, the process of *interpretation* and meaning-making that takes place at the micro-level when audiences consume media texts. In order to better address what Stuart Hall (1980) characterizes as the “decoding” end of the communication process, we need to more specifically attend to audiences’ “on-the-ground” negotiation of various cultural texts in different sociocultural contexts.

Using transnational communication research that focuses on the “local” reception of “global” texts as a starting point, this chapter discusses how developing a multi-sited translocal approach to media reception that “focuses on connections between several local social spaces, exploring hitherto neglected local-to-local links” (Kraidy, 2005, p. 155) can help us confront the challenges of fieldwork and contribute to the development of a more sophisticated multidimensional understanding of media audiences. Bearing in mind the theoretical challenge of approaching research with a full awareness of our (and our informants’) multiple identities, I further consider what a translocal approach might look like, not only in the context of global media studies but also in the broader realm of qualitative communication research. I close by offering a number of strategies that scholars engaged in audience research might usefully employ to develop a more translocal perspective on audiences’ lived experiences and to help them address the politics of conducting such research in a Western academic context. Throughout the chapter, to illustrate my points, I will often draw on my personal experiences as an individual who lives and conducts research in multiple cultural settings. The examples I outline here will demonstrate the usefulness of personal experience as a productive research tool, particularly when we become aware of the translocal aspects of our experiences.

Not an Easy Task

Attending to audiences is not an easy task. While scholars recognize the need to develop a better understanding of audiences’ lived experiences in specific contexts, scholarly attempts to address this need have tended to remain “theoretically sophisticated but

empirically thin,” producing “quasi-ethnographic” works that lack a “commitment to immersion, building of trust, long-term observation, or participation in the daily lives of research participants” (Murphy & Kraidy, 2003, p. 3). This reluctance, on the part of those who study audiences, to leave the relatively safe realm of theory may be explained in part by the fact that entering the city by foot, alongside the anthropologist, can be an extremely messy business when one is a communications scholar.

At the most practical level, the “political economy” of ethnographic research predicated on costly and time-consuming field experience often has dire consequences (financial and otherwise) for scholars in a discipline lacking a tradition of fieldwork. As communication scholars Patrick Murphy and Marwan Kraidy (2003) explain in the introduction to their edited collection on ethnographic perspectives in global media studies, the ethnographic study of media audiences is, as a result, “constantly under threat of becoming the epistemological privilege of well-funded scholars at elite institutions” (p. 4). This reality becomes evident to me each year when I teach qualitative methods to doctoral students (in a Mass Media and Communication program). Despite my attempts to encourage students to pursue ethnographic methods, the time constraints of the program coupled with the seemingly insurmountable financial challenge posed by fieldwork typically result in most of my students choosing textual analysis as their preferred method, with the occasional addition of qualitative interviewing. The difficult economic conditions under which most academic institutions currently operate make it unlikely that this situation will change for them once they develop their dissertation project or find themselves on tenure track – if they ever are “lucky” enough to get there.

In a similar vein, those of us who managed to spend months or years in the field conducting our dissertation research on audiences or human subjects have often found that we could not reproduce the experience until after we are safely tenured and/or promoted. While I was able, for instance, to return to Japan (the focus of my dissertation work) to conduct fieldwork during summers when I was on tenure track, at other times in the academic year I was discouraged from planning for longer fieldwork periods, which might interfere with my teaching schedule and research productivity.¹ If spending a few weeks with informants each summer can help us develop a better understanding of media audiences, it is not exactly analogous to the total immersion or long-term observation that Murphy and Kraidy (2003) are advocating.

At a more general level, when researchers do choose to conduct fieldwork, the identity politics of a research method critiqued for its historical collusion with colonialism and Western imperialist discourse remain painfully difficult to negotiate. Indeed, if the intense debates initiated by the rise of postmodernism about the politics of representation and the (im)possibility of “speaking for the Other” have usefully complicated our understanding of power issues in ethnographic work, they have also rendered the practice of fieldwork increasingly intimidating. It is consequently not particularly surprising that a growing body of media ethnography should be “shaped more by the critique of ethnography’s association with colonialism and Western discourse than by the surprise and productivity of the field encounter”

(Murphy & Kraidy, 2003, p. 4). Fully engaging the historical legacy of Western imperialist discourse on ethnographic work requires scholars associated with American or European institutions to come to terms with the fact that they are conducting research from an inescapably privileged vantage point – a fact that does not necessarily render ethnographic audience research hopelessly perfidious or useless, but one that must nevertheless be addressed and carefully negotiated. This is, by all means, not an easy or comfortable task.

Add to this the challenge of accessing the “increasingly intimate, microscopic and virtual reception environments and practices” created by media technologies that, “unlike the less closed-in and more performative–ritualized spaces that have been the customary sites for ethnographic inquiry throughout anthropology’s history” (*ibid.*), render the very notion of “doing fieldwork” increasingly problematic, and the situation gets even messier (for a more detailed analysis of the shifting nature of ethnographic fieldsites, see for example Clua, 2003; Couldry, 2003). Despite the mess, however, scholars interested in investigating how audiences negotiate media messages in various environments do continue to insist on entering the city by foot (or at least on a bicycle). They choose to do so because, if the challenges of fieldwork can be daunting at times, media ethnography also generates unique opportunities to engage media reception in all its complexity.

A View From the Ground

The pioneering audience studies of Janice Radway (1984), Ien Ang (1985), Andrea Press (1991), Elizabeth Bird (1992), and others too numerous to mention here have taught us that we often get a completely different picture when talking to individuals and observing their engagement with popular culture from the one we take when analyzing media texts and/or the politics of their production and distribution. This fact has become painfully obvious to scholars interested in the relationship between the global environment in which popular culture is generated and distributed and the varied local contexts in which it is consumed.

Those who are looking at processes of globalization from the point of view of political economy see a picture of the world where global media production is increasingly concentrated in the hands of powerful corporations from the richest nations (Herman & McChesney, 1997; McPhail, 2002). These scholars argue that this situation produces inauthentic and alienating cultural forms, which thoroughly penetrate and disrupt the local cultures to which they are ultimately distributed (see for example, Giddens, 1999; Tehranian, 1999). Others recognize that transnational flows are increasingly multidimensional and complex but nevertheless argue that global media promote “an American conception of the world” (Hall, 1997, p. 33). As Hall (1997) puts it, globalization speaks English, even if in a “variety of broken forms” – including “Anglo-Japanese, Anglo-French, Anglo-German,” or even “Anglo-English” (p. 28).

Those who study transnational flows “primarily conceived in terms of multinational corporations, powerful media, communication technology, or government actors” might, however, “fail to recognize the diversity of paths that can lead to global cultural connections” (Condry, 2006, p. 207). What if, for instance, the use of English is less of a symptom of US hegemony than a tool to question powerful elites’ essentializing characterizations of “local” culture – as scholars suggest is the case of much Japanese popular music (see for example Condry, 2006; Stanlow, 2000)? What if the US origins of this global English are ultimately lost, for listeners, in this multidimensional mixing of global cultural production, where our collective memory is “made from the fragments of different nations, making it difficult for that memory to be distilled from any one particular group” (Yúdice, 2001, p. xxvii)? The insertion of “on-the-ground” engagement with local agents into considerations of global processes significantly complicates the picture of transnational cultural influence. As Murphy and Kraidy (2003) remind us: “While globalization may be discursively situated in terms of broad economic, political and cultural trends, media consumption is [. . .] perhaps the most immediate, consistent and pervasive way in which ‘globality’ is experienced” (p. 7).

Indeed, the ethnographic audience research of numerous global media scholars underscore how local agents are often actively engaged in a complex process of transnational reinterpretation through which they translate, mutate, and “indigenize” cultural imports (Tomlinson, 1999, p. 84) – a process that is not, however, devoid of power struggles or negative implications for those involved in it (see for example Parameswaran, 1999; Darling-Wolf, 2003a, 2004; La Pastina, 2007). This research demonstrates that, as local audiences’ identities and hybrid cultural forms are being fashioned in relation – or even in opposition – to the global through involvement with increasingly abstract and deterritorialized imagined communities (Anderson & Kingsley, 1999; Niezen, 2004), the global–local nexus becomes a site of simultaneous resistance and domination, enacted on multiple interlocking axes and negotiated in complex and often unpredictable ways (Appadurai, 2001). In other words, “[t]he identification of structures of power by political–economic media research is necessary, but not sufficient, for an understanding of the local–global dynamic. Grasping how power works in concrete local settings is crucial” (Kraidy & Murphy, 2008, p. 351).

In this context, “[p]art of the challenge of understanding cultural globalization involves recognizing that the global and the local are not so much matched pairs as they are symbolic crystallizations of more fluid, ongoing processes unfolding over time” (Condry, 2006, p. 86). In order to fully tease out the implications of this recognition one must, as García-Canclini (2001) suggests, “focus on the concrete conditions in which cultural processes develop in different countries, on the interaction of globalizing projects and the specific multicultural social arrangements obtaining in given regions” (pp. 3–4). Kraidy and Murphy (2008) propose a view of the local that “ventures beyond prevalent conceptualizations of ‘the local’ as something that exists in suspended opposition with ‘the global’” (p. 339). They contend that an ethnographically thick translocal approach “focused on an intricate

understanding of the encounter between local life and global forces” (p. 339) is a necessary component of such a project, as it “enables an understanding of the local–global dialectic through the comparative study of multiple locales” (p. 346). As they conclude:

Empirical research inevitably must begin with a local context, but if we are to build a truly global subfield of global communication studies, then a doubly comparative research approach is needed, working comparatively between and within various locals, on the backdrop of global processes that are often mediated by national institutions. Multisited research thus must go hand in hand with translocal theorization. (Kraidy & Murphy, 2008, p. 351)

Why Translocalism?

The move toward thinking in terms of “translocal” rather than “global” rests in part on the recognition that, when scholars speak of “the global,” they are often actually describing a series of translocal encounters. I was recently powerfully reminded of the emphasis on the translocal as I was attending an academic conference on the theme of encouraging students to become “global citizens.” The vast majority of the discussions among the scholars present (all engaged in some form of “international” research) centered on the benefits and politics of programs for study abroad (that is, means to provide students with a variety of enlightening *translocal* experiences) rather than on strategies designed to help students develop an increased awareness of the fact that their daily lives and activities – from the coffee they drink in the morning to the TV they watch at night – are necessarily embedded in worldwide networks of interaction with manifold economic and political implications for individuals around the globe.

Thus, developing a truly global perspective on audiences is not an easy task. As Straubhaar (2007) reminds us, “[o]ne of the main limits on globalization in media and culture is that relatively few people have a primarily global identity” (p. 6). Similarly, processes of transnational influence often operate within relatively limited geocultural and transnational cultural–linguistic regions rather than on a truly worldwide scale. “In short, ‘global’ is not ‘universal,’ and ‘global communication’ does not mean ‘universal communication’” (Mowlana, 1997, p. 8).

A translocal approach to audiences can, however, inform our understanding of the global if it is not simply limited to producing translocal encounters (the “study abroad” approach, which often still rests on dualistic comparisons) but is used instead to investigate global–local connections through empirical investigations of multiple local sites, *considered in relationship to each other and within a broader global context*. A translocal approach can, in other words, enable us “to refocus on the local, which is after all the site where meaning emerges, without disengaging from issues involving global forces,”

since “[i]t is through the comparative study of local life in various locations that a living, breathing sense of global communication flows, processes, and outcomes can be comprehensively grasped” (Kraidy & Murphy, 2008, p. 339). Perhaps the most productive aspect of translocalism is that it allows us to address “how one local can help us understand another local” (p. 343). Using the example of global reality television formats adapted to various local environments, Kraidy and Murphy illustrate how this might work. Noting that “[t]he a priori assumption that various format adaptations are linked to the original format (global) but not to each other (locals) is difficult to sustain in the globally connected contemporary world” (p. 347), they explain how, for instance, a Lebanese text may be better understood in terms of its relation to the French incarnation of a format than to its globally licensed form:

[I]f we look at the Endemol format of Fame Academy, a realitybased, singing and dancing competition show, we see that its Arabic-language format adaptation by the Lebanese Broadcasting Corporation (LBC) was mediated by the French adaptation, both called Star Academy. Although France, a large industrialized country with vibrant creative industries and a transnational sphere of influence in the Francophone world, is not usually considered a “local,” in this case, the French broadcaster TF1 was just another local adapter of a global format created in the Netherlands. However, in the current global geopolitical and cultural context, France cannot be considered strictly local in its relationship to Lebanon, where it previously was the colonial power. We therefore have several levels of mediation that complicate the simple local–global dyad. (p. 347)

In this case, the postcolonial relationship between France and Lebanon offers a more useful framework of analysis than a conceptualization of power relations more broadly characterized in terms of local versus an undefined global.

More generally, translocalism can inform our understanding of the local–global articulation in audience research by providing for a wider range of references to draw on in the process of interpretation. I find, for instance, that I tend to interpret individuals’ attitude toward religion in my Japanese fieldsite – where Shinto and Buddhist influences are fluidly negotiated – through the lens of my experiences in predominantly “Catholic” France, where the legality of abortion has remained largely uncontested since 1975, where most people typically go to church only on Christmas night (and, occasionally, at Easter), and where people use birth control but assume they will have children some day and choose to baptize them as infants when they do: where, in other words, the pope’s pronouncements are taken with a (rather large) grain of salt and religion is generally approached as an element of culture to be negotiated rather than as a choice profoundly formative of one’s identity, as is often the case in the United States. As a consequence of this different positioning, I tend to find US scholars’ frequent linking of Japanese religious syncretism to Japan’s “exceptional” ability to globalize foreign elements (see for example Robertson, 1992) somewhat exaggerated.

Translocal connections can thus usefully run in multiple and complex directions. My personal experience of growing up in France on a heavy dose of both US and

Japanese media has informed my understanding of US and Japanese global influence – while at the same time providing insights on French cultural protectionism – just as my work with Japanese media consumers has helped me better understand audiences in French and US contexts (and vice versa). Similarly, when I moved to Japan for the first time, I found life in the countryside highly reminiscent of the small French town where I grew up. The population density, the way people addressed each other in the streets of the village (“Hot isn’t it?” “Cold today!”), the multilayered mountains always on the horizon, evoked a “structure of feeling” (Williams, 1961) much more similar to that of the rural France of my youth than to that of the urban United States, which had by then become my “home.” Years later, however, when I decided to reconnect with my local culture “of origin” by buying a “fixer-upper” in a village some 30 kilometers from the town where I was born, I found my experience of the place steeped in translocal comparisons with Japan. An extract from field notes taken in 2008, when I arrived in the village for the summer, illustrates this process:

We drive up the mountain. It is gray with a fine rain. This reminds me so much of driving up the mountain in Shikoku. When we get to a spot where the fog is hanging on the side of the mountain, I ask [my partner] if he knows what this reminds me of. He says he does. I can’t believe how similar to Japan this is. It is interesting how this place that I am from is so familiar not because that’s where I am from but because it reminds me of a far foreign place. It takes on a completely new meaning for me.

This shows how translocal encounters can shape our understanding and experience of various “locals” – including, in my case, the place where I am “originally from” – on multiple and multidimensional axes. I suggest that this multilayered process of complicating the local offers productive potential for scholars involved in all areas of audience research, even if their research is not necessarily conducted in a transnational context.

We Are All Translocal, Including Audience Researchers

Taking a historically long view on transnational and intercultural influence, sociologist Jan Nederveen Pieterse (2009) convincingly argues that processes of translocalism and hybridization are the historical norm rather than the exception. Noting that “we are all migrants” (2009, p. 25), he suggests: “The moment we shift lenses from sedentary to *mobile* categories, the whole environment and the horizon change: hunting, nomadic pastoralism, fishing, trade, transnational enterprise, and hyperspace all have deterritorialization built in” (p. 144). The recognition that “hybridity is deeply rooted in history and quite ordinary” (p. 97) has significant implications for the development of a translocal approach in communication research. Under this premise, as Pieterse

contends, “[w]hat is problematic is not hybridity but the fetishism of boundaries that has marked so much of history” (ibid.). In other words, recognizing that we are all, to some extent, translocal (or, as Pieterse would put it, hybrid) encourages us to critically engage the politics of representation permeating academic research. As Pieterse wonders:

[I]f all cultures are hybrid all along, then the problem is not hybridity but boundaries: how is it that boundaries are historically and socially so significant? How come that while boundaries continuously change shape in the currents and tides of history, boundary fetishism remains, *even among social scientists?* (Pieterse, 2009, p. 109, emphasis mine)

If we must be careful not to unquestionably celebrate cultural syncretism and translocalism without taking into account the historical circumstances under which hybridity develops – as Yúdice (2001) reminds us, for many “hybridity results from having to satisfy basic needs by participating in a system of production and consumption not of one’s choosing” (p. xv) – Pieterse’s questions are important ones to address. Answering them requires us to recognize that (1) all identities are, as he suggests, translocal at least to some extent; (2) some elements of our translocal identity are nevertheless more obvious and/or readily acknowledged than others; and (3) we must critically consider why and how these elements are privileged over others.

For instance, my own translocality is enacted most powerfully on a transnational and/or transcultural axis. Born and raised in France, I have spent most of my adult life in the United States, where I currently teach. I am engaged in an ongoing relationship with Japan, where I moved for the first time as an English teacher some 15 years ago, and which became the main focus of my research (and my ethnographic fieldsite) shortly thereafter. I have lived on the island of Shikoku for several years and have been teaching a summer workshop in Tokyo on a regular basis for the past 10 years or so. I have always returned to France regularly to visit family and have remained close to the francophone community in the United States through my two daughters’ French immersion school. I have recently chosen to spend a year-long research leave conducting fieldwork near the town where I grew up (I am looking out onto the French countryside as I am writing these lines). I have homes in France and the United States, and my bicycle is parked in Tokyo (it literally is). In addition to my professional and personal relationships to these three cultural environments, my life partner of 20 years is a Canadian of Ukrainian origin, and, while I have never lived in Canada, we frequently visit his family there. Our daughters are US, French, and Canadian citizens and like to “claim” their “Japaneseness” through expressions of familiarity and affection for a culture in which they have spent extensive periods of time from the moment they were born.

In a strictly academic setting, however, the fact that I speak an accented English, teach at a US institution, and mostly conduct feminist research on Japanese popular culture are the most common axes on which my translocalism is acknowledged and negotiated. Furthermore, not all facets of this identity are treated equally (or, for that

matter, are equally significant to my academic research). While I have never found my ability to conduct research on US or French popular culture challenged – despite the (possibly compromising) fact that I am a non-US citizen who left France more than 20 years ago – I frequently find myself having to establish my credentials in order to conduct feminist research in Japan. For instance, despite my much greater *academic* knowledge (from an anthropological, sociological, or historical point of view) of Japanese culture than of the culture of the other two nations where I have lived, the stamp of approval of a Japanese national was deemed desirable for validating my research on/with Japanese female audiences when I applied for tenure. I was also asked to include several males on my list of outside reviewers, as female scholars' ability to "objectively" judge my feminist research was deemed suspect. In other words, just as we embody different selves in different situations, some elements of our translocal identity necessarily, and at times problematically, take precedence over others in specific settings and at specific points in time.

More specifically, as some aspects of identity are normalized, others are, for lack of a better word and at the risk of sounding repetitive, "othered." For instance whiteness, maleness, middle-class status, and "Americanness" tend to be naturalized in US academic settings (unless one teaches, perhaps, in a Women's Studies or African American Studies program). As a result, the racial, gendered, class, and national identities of white, male, middle-class US citizens are rarely acknowledged and/or problematized. The complexity of identity politics in academic research has been discussed at length (see for example Narayan, 1989; Bow, 1995; Lakritz, 1995); a full-fledged consideration of its multiple implications is beyond the scope of this chapter and would be repetitive. Suffice is to say here that problematizing *all* identity boundaries emerges as a useful and necessary exercise. The following section offers some suggestions on how we might proceed to do it by developing a more translocal approach, which might be usefully applied beyond global media studies to various areas of audience research.

On Developing Translocal Strategies for Audience Studies

Questioning Our Own Identities

To develop a truly critical translocalism (Kraidy, 2005), one might productively start by considering the implications of one's own location(s). In a fieldwork setting, this means recognizing and attempting to come to terms with the multiple and complex ways in which our identity (and that of the participants in our research) is constantly performed and negotiated (for more detailed reflections on how this might be accomplished, see for example Akindes, 2003; Buarque de Almeida, 2003; Darling-Wolf,

2003b; La Pastina, 2007). In the French village where I currently live and conduct fieldwork, I have interestingly realized, for instance, that I am constantly “catching” myself claiming my insider status as someone who has grown up in the region. While this is at best an exercise in futility, considering my obvious outsider status as a long-term resident of the United States and, perhaps even more, as a university professor, the fact that I suddenly find myself emphasizing an aspect of my identity I rarely otherwise claim illustrates the politics of my own representational choices.

Defining myself as an *Ardéchoise* is not necessarily “wrong” – I did grow up nearby, I feel that the strongly asserted cultural specificity of the region remains part of my current cultural makeup, and it offers a convenient link to the lives of the people I interact with on a daily basis. I must be wary, however, not to let this strategic representation serve as a means to downplay other aspects of my identity, which may be more difficult to negotiate (including my status as a researcher), or to justify claims to a problematic form of automatic epistemological authority. At a practical level, I have found that the official consent forms I bring to formal interviews can serve as a useful reminder of my status as a researcher from a foreign institution. They help establish the link between my “local” self – the French-speaking me, who attended the local high school – and my “global” work, visually represented in the university logo at the top of the page and in the English language text surrounding it.

More generally, I must acknowledge that my translocal position is one of privilege that significantly differs from the forced translocality of migrant workers, of immigration that occurs as a result of political strife, intense economic hardship, or forced relocation, or of postcolonial experience. Even though I was raised in a predominantly working-class environment (I first moved to the United States as a live-in babysitter), my national and racial identities afforded me the privilege to *choose* a (somewhat) global identity. In a similar vein, while the historical encounters between France and Lebanon mean that Lebanese scholar Marwan Kraidy and I share some cultural commonalities that are based on the “conflictual unity bonded by common political and cultural experiences” (Pieterse, 2009, p. 74) that often arises from the experience of postcolonialism, I am constantly reminded in my relationship with him of the crucial qualitative differences between his knowledge of “my” culture – steeped in the legacy of forced cultural influence – and my familiarity with “his,” shaped by an orientalist desire for an exotic Other.

This does not mean, however, that these cultural commonalities cannot be positively harnessed to promote a greater understanding of the nature of transnational and transcultural influence in both of these cultural environments – as happened in our recent respective studies of the adaptation of the same reality TV format in France (Darling-Wolf, 2010) and in the Arab world (Kraidy, 2009). Indeed, if, as Pieterse (2009) suggests, “[p]owerful interests are invested in boundaries and borders” (p. 145), a critical translocalism must ultimately move beyond identity politics, to develop “a new awareness of and new take on dynamics of group formation and social inequality [. . .] furthered by acknowledging rather than by suppressing hybridity” (p. 121). In other words, considering the implications of our own location(s)

entails acknowledging the ways in which we are hybrid and harnessing the productive potential of this recognition in specific cultural, historical, and social contexts.

I was recently reminded of this potential when I realized that a Japanese informant – with whom I had long communicated in English or Japanese – actually spoke very good French and had traveled extensively throughout Europe. We both were delighted at this new connection, which took our relationship to a different level and complicated our understanding of each other's identities. We now speak French whenever we see each other. This incident also reminded me, however, of the power of my institutional connection to the United States in defining how I am viewed in my Japanese fieldsite, where interactions with Westerners are typically limited to those with the few English teachers (most often from the United States, Canada, or Australia) who make it to the island. It has encouraged me to acknowledge my French citizenship more honestly in my interactions with Japanese informants.

Denaturalizing Normalized Identities

As noted earlier in this essay, some identities are more easily recognized as translocal or hybrid than others in a US academic setting. One step toward developing a more sophisticated approach to translocalism entails recognizing the hybrid nature of *all* identities and denaturalizing those aspects of identity that have been hegemonically naturalized as the “objective” norm (for a discussion of this process, see for example Bordo, 1990; Harding, 1990; Narayan, 1989). We might productively start, for instance, by critically addressing the fact that white people have a race, men have a gender, heterosexuals have a sexual orientation (and so on), or that Native Americans are the only US citizens *not* to have acquired their national identity through a process of immigration (either forced, as in the case of African Americans, or voluntary). As illustrated above, doing so would entail encouraging individuals to consider the implications of their own translocal identities.

Our success in destabilizing the boundaries of race, gender, sexual orientation (and so on) also rests, however, on our willingness to let individuals whose identities have been historically and culturally normalized enter a conversation too often dominated by rigidly defined identity politics. This is not to suggest falling into a form of extreme postmodern pluralism that erases power relations and treats all perspectives as equally valid – we certainly must keep in mind that different identities have different practical and political consequences. But we must work to consider critically all identities, in all of their complexity. I often find, for instance, that within the academic community my status as an immigrant is superseded by my Caucasian racial identity and by my European origin – that is, I may speak with an accent, but I am granted the status of honorary US citizen as long as I more or less follow the rules of US academic behavior. Failure to acknowledge this important side of my identity not only diminishes the potential for recognition and coalition-building across identity boundaries within the immigrant community – to which, incidentally, I do feel

strongly connected – but also serves to problematically veil the complex ways in which the politics of race permeates the discourse on immigration, and, more broadly, “diversity.” A more productive route would be to involve everyone in a carefully situated critical examination of the “genealogies of hybridity” (Pieterse, 2009, p. 91) that “does not preclude struggle but yields a multifocus view on struggle and, by showing multiple identity on both sides, transcends the ‘us versus them’ dualism that prevails in cultural and political arenas” (p. 145).

Recognizing the “Local” of Academia

When I first moved to the United States from an environment where attending a four-year university was a relatively rare occurrence (neither of my parents went to high school, my sister attended a two-year community college), I often found the academic culture of vigorous in-class discussions, office hours (this was long before email became a favored form of communication between professors and students), extra-curricular activities, scholarship applications, recommendation letters, and honors programs more daunting than the broader Texas culture that I also found myself having to negotiate. Today I still find that the most difficult translations are often those from the world and speech of academia into the world and speech of individuals (frequently of a rural lower-class background) whom I conduct research with, rather than those “only” involving switching between different national languages – French, Japanese, English.

As a culture that “takes its capital from the scholarly tradition, from the machineries of literacy and education, which are affordable only to a privileged few” (Chow, 1993, p. 114), the academic context in which most scholars are immersed constitutes a “local” environment that significantly shapes the way they see the others and experience the world. Developing a translocal perspective requires us to learn to identify and negotiate this local context’s “cultural assumptions.” Because one must be highly educated to enter the ranks of academics, some of the greatest challenges in accomplishing this task are linked to class biases.

Regardless of the nature of the sociocultural background in which they were raised, (future) academics must learn to function in a professional culture that brings with it upper-class biases regarding, for instance, the nature of work (work is more than a way to put food on the table, individuals have some control over their daily schedules), the use of and access to technology (people can be reached at any time and/or wherever they might be, an email message can be expected to yield an answer within days, if not hours, of being sent, a computer must be replaced every few years), or what constitutes a “decent” salary (a lot more than minimum wage, even at the recently raised rate of \$7.25 an hour). Such assumptions are challenged on a daily basis in the small village of about 350 inhabitants where I currently reside. While most households count at least one cell phone, frequent and long conversations

are rare, and people are definitely not obsessed with their blackberries. In fact, it is not uncommon to have people tell you they could not call you because they were “out of minutes” (my own plan gives me 30 minutes a month, which, blissfully, I never use up). While I found it difficult to function without an Internet connection before a phone line was installed in our house – I missed my favorite newspapers and podcasts, kept on forgetting that I couldn’t check things online and got intensely frustrated trying to read my email from my neighbors’ computer that just seemed unbearably slow – few people here use email to communicate on a regular basis. I quickly had to learn that I simply couldn’t expect people to respond to my email messages, and that if I wanted to set up an interview I had to invite them to my house for dinner.

In other words, we must be aware of the ways in which the biases of academic culture might influence our interactions with individuals in other “locales” and the conclusions we draw about the significance of these individuals’ engagements with mediatized texts or cultural practices.

Developing Language Skills

Developing a translocal approach requires us to develop languages skills that help us communicate from one local setting to another. These skills may take the form of “traditional” foreign language competencies – often still a challenge in a US cultural setting that lacks a long tradition of language study from an early age (the national education system requires French schools to start teaching English to children in first grade, two more languages are added in sixth grade) – or they may focus on our abilities to translate the speech of academia into the vernacular languages of the audiences we study.

Granted, this is not always an easy task. While I was lucky enough to be encouraged to study Japanese in my PhD program, I have struggled to fit it into my busy schedule as a professor. But perhaps more time could be dedicated to it were it to take greater priority over the development of other research skills and not to be regarded simply as an extra-curricular activity. Furthermore, regardless of its ultimate success, the *process of attempting* to develop language skills is a useful exercise in humility, which helps destabilize the lazy naturalization of US English as a global language (“everyone speaks English”) and might ultimately encourage greater tolerance for the multiple versions of English spoken by individuals in different environments in all their peculiarities of accent.

In a similar vein, efforts to translate our work into everyday speech open up productive opportunities for conversations with individuals outside the limited realm of the academic community that most of us find ourselves so immersed in. Indeed, some of the most insightful discussions of our work might come from members of the audience we study, not from respondents to a conference panel. Take the

passionate discussions I had with a Japanese key informant over the course of an entire year after I suggested that Pikachu was representative of Japanese culture – this was at the height of the Pokemon craze. Or the pointed questions from a French media consumer regarding my analysis of the nationalistic subtext of reality television. Those were fruitful sources of research inspiration as well as highly enjoyable intellectual debates.

Moving Beyond Dualisms

Because it is predicated on developing a multi-sited approach aimed at undermining the often rigidly defined boundaries of identity and/or place, translocalism in audience research requires us to move “beyond dualism, binary thinking, Aristotelian logic” to emphasize “the *in-between* the *interstices*” (Pieterse, 2009, p. 120). This is not an easy task within an academic structure that, while often paying lip-service to the value of interdisciplinary research and collaboration, is generally organized around narrowly defined disciplines and/or area studies that scholars must “fit into” if they are to receive funding, recognition, or promotion (Appadurai, 2001). This division, in turn, exacerbates the identity politics discussed above, as scholars who do not fit neatly in any one category are encouraged to “pick a camp” (for a discussion of this process, see Bow, 1995).

While these structural issues may be difficult to address in the short term, moving beyond dualistic thinking can be a first step toward destabilizing such dualisms. We might productively start by thinking critically about the questions we ask each other. When talking about my work, I am often asked, for instance, whether I am a “bilingual,” which, in this particular context, generally aims at finding out whether I speak *Japanese*. I am, indeed, a “bilingual,” since French is my native language. I do my best in Japanese (enough to function in the field) and I dabble in Spanish. The fact, however, that the question is put in terms of “bilingualism” illustrates the continuing hold of binarism on academic logic – in a similar vein, I am often asked whether my children have “dual” citizenship. Critically assessing how this mode of thinking influences the way we conceptualize the world might help us recognize that multilingualism is not that uncommon – in fact the monolingualism of most US citizens is the global exception rather than the rule – and it might also help us develop a more complex understanding of identity, one liberated from the either/or, “us versus them” epistemology.

Similarly, we must acknowledge that seemingly simple questions such as “Where are you from?” may require complex answers (my typical response is “How much time do you have?”; my partner’s is “All over”), which teach us to respect individuals’ acts of self-definition in response to such queries (my oldest daughter likes to describe herself as “French, American, Canadian, and a bit Japanese”) and to accept “unsatisfactory” answers without further interrogation (avoid the still too frequent “No, but I detect an accent. Where are you from *originally*?”).

Embracing Hybridity – Not Just Theoretically

If, as Pieterse (2009) suggests, “[h]ybridity has become a regular, almost ordinary fixture in popular and mainstream culture” and “is inching up to become the leading paradigm with a steadily growing literature” (p. viii) in the social sciences, the recognition that hybridity “is deeply rooted in history and quite ordinary” (p. 98) must move beyond mere theoretical acknowledgment. But if scholars have powerfully addressed the implications of this recognition to complicate, for instance, our understanding of transnational cultural influence, this recognition is often more difficult to apply – as I hope to have already illustrated to some extent – in the lived experience of our daily academic lives. Those who, for reasons of national/cultural origin or ethnic/class background, do not fit the cultural standards of US academic culture neatly – the Asian teaching assistant (TA) with a strongly accented English, the junior faculty member who spends more time engaging in activism than publishing in academic journals, the non-American job candidate whom we suspect might at some time “decide to go home” – are often marginalized rather than celebrated as valuable sources for productive translocal encounters. While, certainly, a minimal ability to function in a US academic setting can reasonably be expected of individuals employed or studying at US institutions, the fact that translocalism is often construed in terms of the “problems” it creates rather than of the possibilities it offers prevents us from fully harnessing the positive potential of translocal individuals in academic life. We must learn to embrace hybridity in all its implications.

Reclaiming Interpretation

Because it encourages us to identify and draw on different aspects of our identity, a translocal approach is predicated on the recognition of the process of interpretation as a central element in developing a deeper understanding of the audiences we study. As Geertz reminds us:

The claim to attention of an ethnographic account does not rest on its author’s ability to capture primitive facts in faraway places and carry them home like a mask or a carving, but on the degree to which he [*sic*] is able to clarify what goes on in such places, to reduce the puzzlement. (Geertz, 1973, p. 16)

The politics of academic research have, however, turned interpretation into an intimidating process, particularly when it concerns the lives of individual audience members who can “talk back to us” rather than relatively quieter media texts. Often this results in an apologetic approach to identity, which is focused on the factors that may “bias” our research rather than on those elements that might usefully inform our interpretation of a particular situation at a particular point in time. Certainly, and as I hope to have argued assertively enough, considering critically the impact of

our identity on our research is a necessary exercise for all scholars to engage in – since, as Geertz (1973) reminds us, interpretation “raises some serious problems of verification” (p. 16). But I agree with Murphy and Kraidy’s (2003) contention that,

if media ethnographers have a political commitment to a *critical* ethnography – one that is concerned with how power is taking shape and transforming people’s lives on a global scale – then they must overcome their queasiness with the possibility of making generalizations and of objectifying/commodifying/inscribing the Other. (Murphy & Kraidy, 2003, p. 15)

Developing a translocal approach to audience studies encourages scholars “overcome their queasiness” by reclaiming their own identities and those of other scholars, with whom they might cooperate, as important tools in developing empirically grounded interpretations, informed both by theory and by a personal engagement with multiple research sites – as “an explorer, not a tourist” (Pauly, 1991, p. 7). Translocalism is, in other words, an important resource if we want to inform, contextualize, and complicate our understanding of other’s experiences and of the meaning of our own investment in academic work.

Concluding Remarks

In contrast to García-Canclini’s (1995) portrayal of the communication scholar entering the city by plane, Pauly (1991) describes the qualitative researcher as someone who “ambles along the circuitous back roads of public discourse and social practice” (p. 7). This second metaphor, I contend, can usefully guide the work of audience researchers interested in developing a more sophisticated and carefully situated understanding of individuals’ engagement with mediatized texts. If taking the backroads is not always an easy task, the more roads we travel, the greater our ability to draw translocal linkages between them and the greater the pool of experiences available to us for developing comparative and cosmopolitan interpretations of audiences’ media practices. In our voyage we must also, however, strive to develop a critical understanding of why and how some roads are better traveled than others, and we must challenge the notion that the more traveled paths are necessarily the more appropriate routes. Finally, we must keep in mind that we are not traveling alone. A translocal approach encourages us not only to develop our own multi-sited observations, but also to compare our travel logs with those of other, differently located scholars, including those whose road maps might significantly differ from ours. Such a comparative approach can help us better understand how our own experiences shape our understanding of the world and how, in turn, those of the individuals we study might influence their understanding and negotiation of the media texts they consume.

NOTE

- 1 I must note here that my colleagues as well as our department chair have always been very supportive of my work. Even with a supportive department, however, the larger organizational structure of the university often limits scholars' ability to conduct fieldwork when it is not perceived as a necessary requirement for tenure and/or promotion.

Mythic Viewing

Reality in Indian Audiencehood

Vamsee Juluri

ABSTRACT

This chapter examines the different ways in which media audiences think about reality, particularly in postcolonial contexts. Using data and findings from three studies of Indian audiences, the reception of a popular Hindi movie (*Hum Aapke Hain Koun*), the reception of music television (mainly MTV and Channel V), and an ongoing study of the reception of the mythological genre (covering recent animation films as well as older Telugu black and white classics), the chapter shows how audience readings of important issues like family, nation, and religion may be underpinned by deeper assumptions about human nature and reality. Finally, it explores some of the ways in which audience investments in commonsense ideas about what is “real” may illuminate the politics and possibilities of media audiencehood in postcolonial modernity.

Introduction

The primary aim of this chapter is to examine the ways in which media audiences conceive of and think about reality. In an age when media producers and programmers are claiming that they produce authentic forms of “reality,” whether it is the globally ubiquitous genre of reality television or the growth in publishing genres like memoir

and non-fiction writing, the question of how audiences assume something to be “real” in the context of popular reception becomes an important and urgent project of inquiry for scholars in media studies. Such concerns have been addressed somewhat obliquely in audience research, especially in those studies informed by critical cultural studies approaches. However, in the wake of, on the one hand, the exceedingly vocal claims to the manufacturing of reality that were put out by media industries and, on the other, the somewhat evasive turn in responses to concerns about reality and truth that was brought about by uncritical postmodernism in the academy, it is important for audience researchers to take up the issue of how audiences bestow the all-important category of meaning, which declares that something is real.

How audiences do this is especially instructive in the Indian context for a variety of empirical and philosophical reasons. Since policies of economic liberalization were initiated in 1991, Indian media have expanded exponentially, plunging millions of people into a vibrant and pervasive mediascape consisting of dozens of global, national, regional, and local satellite television channels. India’s massive film industry, consisting of several centers of production in various languages like pan-Indian Hindi and other regional languages, did not find itself overwhelmed by the sudden influx of foreign-owned media; it has emerged instead as a major cultural force in India and in the Indian diaspora and as a significant influence on global popular culture. News and print media also continued to thrive in a market with a growing middle class. Given the massive increase in the quantity of media programming and consumption all around, the question of what audiences might believe to be real is indeed a complex one.

More recently, self-styled “reality shows” have become widespread on Indian television and have generated debate about a host of issues, ranging from the public display of private secrets (the show *Sach Ka Samna*) to the exploitation of children (the Zee Telugu dance contest show *Aata*, which was criticized by the state’s Human Rights Commissioner in April 2010). However, the question of what audiences think is real goes far beyond the confines of the reality genre alone, for the “reality” tag sometimes works as a signal to savvy viewers that it is all contrived anyway. Making judgments about the veracity of media is perhaps as pervasive as media consumption itself, as audiences decide to believe or disbelieve everything, from breaking news sagas about boys trapped in wells to infomercials about weight-loss and complexion-enhancing products. Even if specific media representations are believed or disbelieved, audiences also enact, in their reception practices, deeper beliefs about things like identity and nation, about why things are the way they are, and about everything that passes under the quiet certainty of commonsense. In the case of Indian audiences, there is another level of belief that is pervasively at work, especially in the consumption of mythological media. Movies and TV shows about the gods are not viewed in the Western manner of treating mythology as just stories; instead they draw on more complex religious sensibilities as well. To underscore all these examples, we may note one more iconic trope in popular media narratives about reality: the well-signaled and staged “moment of truth,” which has become a fixed feature in numerous genres. In reality shows, this moment is often signified in the exit interview

of the losing contestants or in private confessionals. In Indian soap operas, the moment of truth takes place in a scene of bright lighting, loud music, and costumes that are louder still, and expressive close-ups as family members assemble in a great hall to discover the truth about some betrayal or the other. Reality in many ways is a pleasure of popular media consumption that cuts across genres. The question to be examined is how audiences imagine it, and at what cost.

Three Trysts with Audience Realities: Family, World, God

The first reception study I discuss in this chapter is Juluri's (1999) study of *Hum Aapke Hain Koun* (henceforth HAHK; *Who Am I to You?*), a popular, commercially successful Hindi-language film released in 1994, just three years after India began a sweeping policy of economic liberalization that brought in its wake a massive everyday influx of consumer goods, foreign and domestic, and a public culture of rabid consumerism as well. The context is important to the understanding of the film's reception, because in some ways HAHK was the first major popular cultural phenomenon that captured the imagination of the nation since the dawn of globalization in India. At a moment when the media culture in India seemed awash with global images like the iconic red-costumed lifeguards of *Baywatch* (and Indian cinema seemed to have gone literally underground with its tales about crime and other sordid subjects), HAHK came down into the cinema halls and hearts of India like an angelic light, descending from the sweeping staircase of a grand, traditional Indian mansion from the movies of the mid-twentieth century.

The story of HAHK was simple enough. Two families talk about, and then arrange, a marriage between their children. The siblings of the bride and groom then slowly fall in love; along the way, some brief conflict ensues, but in the end everything is wonderful. Unlike many other Hindi movies of the time, HAHK had no violence, no profanity, and was greeted as a family movie in the sense that it was about family life, and also in the sense that it was a movie that the whole family could watch together. Its cheeriness was infectious; but it was also derided by critics for being "unrealistic." With its painfully detailed depictions of wedding customs, festivities, and inanities, it was even described as a "glorified wedding video." But at the same time the movie was at the heart of a massive outpouring of adulation, not only for its promise of sustainable happiness in a time of rapid social change, but also because of its ideological renewal of faith in a sense of Indianness that was much fought over in the political culture of the time.

The second study I discuss in this chapter is Juluri's (2003) reception study of music television conducted in the late 1990s. Despite initial concerns about cultural imperialism and Westernization, global satellite channels like Music Television (MTV) followed a programming strategy of localization in India that led to an intensely

hybrid cultural environment, built largely on Indian film songs presented as part of a rather global look, full of video jockeys (VJs) with American accents and extraordinarily exotic promos. My study focused on two broad issues. One concern addressed the proliferation of music countdown shows, with their attendant promises about representing the public through vox pop media interviews, and also through the instrument of the top-ten chart. A second concern was the emergence of a popular nationalism suited for a global context, as represented most vividly in the hit song “Made in India.” I discuss both these issues in the present chapter, focusing on the different ways in which audiences made claims about what they believed to be reality – whether the reality they were talking about was that of personal and emotional notions or an imagined geopolitical one, like national identities.

The third study I draw upon in this chapter is an ongoing study of the production and reception of mythological cinema (Juluri, in press). Myth, in Indian media and popular culture, is less closely associated with the Western understanding of myth as a story, a fiction, or a lie – in opposition to truth or reality – and more closely associated with popular religious tales from the *Puranas* (the name given to the ancient epics, the *Ramayana* and *Mahabharatha*). Indian cinema began as a largely mythological genre in the early twentieth century, retelling in cinematic form the time-honored tales of the gods that generations had heard as stories or had witnessed as performances in dance, art, and theater. In the 1980s, when Indian national television reinvented itself as a commercial medium, the serials that captured the largest audiences were about the *Mahabharatha* and the *Ramayana*. More recently, since the rise of satellite television and digital media forms, the tales of the gods have once again proved to be popular, commercially successful, and quite ubiquitous – in the form of animated TV serials, feature films, interactive compact discs (CDs), and the like. The audience for these myths, in this sense, has spanned generations of experiences in postcolonial modernity ranging from the Gandhian to the more recent Hindu nationalist. Tales of these audiences’ awestruck engagement with mythic media abound; prayers and ceremonies for the TV screen, conflation of actors with their divine roles, a deep sense of the miraculous, the sacred, the redemptive. However, as Rachel Dwyer (2007) writes, this important genre has seldom been studied for its own worth (being reduced instead to a corollary of political questions about religion), and my study is an attempt to contribute on that count. In the present chapter I focus mainly on the ways in which audiences invoke the idea of the real in discussing the tales of the gods, and I do so in order to highlight the nuances with which media and other epistemologies operate together in invoking a reality that is at once secular and sacred, human and divine, and ultimately reasoned out and believed in all at once.

Truth and Power in Audience Research

Despite a long-standing tradition of regarding, and being sensitive to, truth as something that distinguishes academic practice from other pursuits, questions of truth have

often been subsumed to questions of power in audience research. If the earliest effects researchers were concerned with were largely instrumental notions of media power, critical scholars have been concerned with power in a larger historical and political sense. However, a sense of opposition between power and truth has been implicit in the critical tradition and, to some extent, in cultural studies audience research as well – and that is a relationship worth recognizing here from the outset. Even as cultural studies audience research came out of a moment of intellectual rupture in earlier Marxist approaches to culture (as well as out of an opposition to dominant US social scientific mass communication research), it has maintained a sense of distinction about truth and power. The critique of ideology in Stuart Hall's encoding–decoding model, for instance, suggests that power is something we measure against how much the audience's perception of reality (usually an economic one) is distorted. Even as critical audience researchers have been circumspect about the role of the researcher in claiming unmediated and infallible access to reality, the fact is that reality, or an informed understanding of it, is what we invoke in our critiques of power.

However, as I have discussed in my book (Juluri, 2003), the epistemological concern with reality has also led audience studies in the past into a dead end of sorts: scholars claimed impasses about the project of audience studies precisely at a time when it was about to become a global project, poised to take on the rapid globalization of media and audiences (Murphy & Kraidy, 2003). Global audience studies have thankfully neither disappeared nor dissipated into a plunging vortex of epistemological navel-gazing, and reality has remained an abiding concern not only in what we do as researchers, but also in what we talk about. Justin Lewis (2004) argues, for example, that, even if the audience may seem less than fooled about the claims to transparency of the reality TV genre, it still accepts certain ways of knowing that have become a pervasive part of daily life in media-inundated societies. "It is difficult to consciously draw a line between the logic of the mediascape and the way we make sense of the unmediated world" (p. 299). As a striking example from the *Cosby Show* study (Jhally & Lewis, 1992) reveals, audience members can feel that a character doesn't look like a lawyer not because they have seen other lawyers or know what a lawyer looks like, but simply because they have seen lawyers on TV and know what a TV lawyer is supposed to look like. Media codes of reality, in other words, are so seamlessly entwined in daily life that even a savvy rejection of specific media representations, or even genres, may not amount to resistance in a political sense. To put it another way, audiences may reject specific media claims to truth, but questions about truth itself are not beyond the politics of media representations today. As for what this means for the traditional concerns of cultural studies like power and resistance, perhaps it is not incorrect to say that power is the default condition of audiencehood, and resistance is, at best, an occasional utterance or a comment made by scholars on that occasional utterance. To celebrate audience resistance might be too optimistic, but to disregard it entirely would be a fallacy too.

The problem of power is doubly compounded when we turn to cultural studies of global audiences for the simple reason that global scholars are frequently placed in a dilemma when they work in and study certain locations. While in some places

such as the United States and United Kingdom audience studies assume an unnamed normativity (presenting specific audiences as universal audiences), audiences in other places are often marked as the “other” in the literature. As a student of Indian media audiences, I must acknowledge that, while my arguments pertain to the Indian context, we must also be careful not to essentialize them into representations of otherness. Indian audience studies may share the concerns of British cultural studies, but there are elements of Indian thought that may also inform cultural studies as a global project. One could therefore propose that the truth of Indian audiences may not always be the truth of Indian audiences alone, but perhaps encompass the truth of audiences in general. In the case of some of the specific genres and themes of the Indian mediascape (which is as much global in its ownership, dissemination, and form as it is Indian), we may then assume that what audiences in India believe, how they believe it, and the politics of these practices may to some extent resonate with global scholarship. In the following sections I propose, on the basis of my own audience studies as well as from secondary readings of studies of audiences in India and elsewhere, that the media audience’s investment in reality may be examined in three broad categories: reality as something nasty, reality as something nice, and reality as religion. These categories do not pertain to any one genre or theme as such; they are proposed instead as a way of understanding what media texts and media audiences seem to assume as a basis for their beliefs and claims about myriad subjects – be these relationships, politics, identities, work, living, pleasure, violence, or peace. To put it another way, these categories may be seen as the main ones in and through which the media tells a story about reality and the audiences believe it. My aim here is to propose that how audiences make up their minds about what is real is as important to media scholars as what they make up their minds about. This is especially true when we look into the mental world of the audience beyond the notions of news, opinion, and fact. With news and political worldviews, as we have seen in numerous cultivation studies (Shanahan & Morgan, 1999), there is a clear and empirically observable difference between the opinions of an audience and the factual world. However, when we turn to areas of audience beliefs that cannot be easily verified against an empirical reality (such as the belief in the existence of gods, to name one, but also mundane ones, like how audiences view human nature, or society, or people in general), it is useful to explore what audiences turn to when making claims on reality.

Reality as Something Not So Nice

If there is one ideological fulcrum on which the reality television as a genre has come to rest, it is the depiction of human beings as fundamentally unpleasant toward one another. It may not be an exaggeration to say that what makes “reality” TV is the fact that its moment of revelation is often one of nastiness. The assumption of this

genre is that, if people are being nice, then they are only displaying a façade, a mask of civility put on perforce by individuals in a world where its absence can be punished by law or through other, less formal means of ostracism and disapproval. The competitive format is especially suited for encouraging an unpleasant outcome. Questions remain, though, as to how and why, the institutional quirks of attention-grabbing, drama, and ratings aside, the media culture has come to equate truth with things unpleasant. Historically, it may be safe to say that this phenomenon did not begin with the present glut of reality shows like *Big Brother* or *Survivor*, although the format of these shows may have narratively formalized such propensities. Even in fictional formats, bad behavior sometimes makes characters seem more realistic, as Justin Lewis (2004) suggests in his example of audiences that think of *The Simpsons* as the most realistic family on television.

While reality shows in India are not entirely given to the premise that the real is “not so nice,” the implications of realism as a media feature in the Indian context are somewhat more complex than in Western cultures, particularly in the case of popular Indian cinema. It may be useful to briefly review the codes of realism in Indian visual culture before turning to the ways these codes have played out in post-globalization forms and their reception. The two most popular media in India, cinema and television, have not had a history of realism in the Western fashion. Movies began as a largely mythological genre in the early twentieth century, and, even in the “socials” (the film industry’s term for non-mythological genres, like drama and comedy), melodrama and exaggeration have been the preferred form of expression and of pleasurable consumption. There have been some gestures toward realism in recent movies, largely in the area of logical writing and technical sophistication; but suffice it to note that there is more to the experience of Indian cinema than meets the eye – and the modern eye at that (Juluri, in press). Indian television began, however, with a somewhat more serious, self-appointed vision: it was to be the beacon of the Nehruvian state’s tool for development, modernization, and progress. Until commercialization heralded the need for entertainment and fiction in the 1980s, Doordarshan took reality rather seriously, in content and in form. What it showed viewers was not fantasies of dancing lights but documentary-style official-sounding pictures of farms and farmers, and national leaders like Indira Gandhi going about the business of the state. Interestingly, the promise of the real on television became more explicit in the wake of television’s commercialization, and especially in fictional serials. Since the 1980s, Indian television has changed to such an extent that reality shows feature today among many genres, and there are shows like MTV India’s *Roadies*, in which the criticism and humiliation of the participants is a touchstone of realism (the promos for the show also advocate something labeled “raw,” which presumably also derives from the broader semiotic stable of TV’s “realness”).

Although reality shows and their ritual humiliation of participants were not yet a part of the media universe at the time when I conducted my studies of Indian audiences (and they would prove richly rewarding as a topic for future research), the assumption of reality as revealed by something unpleasant was very much in evidence

in them. Interestingly, the belief in reality as a fundamentally unpleasant revelation is not something that comes up in my study of the mythological genre, although issues of realism in general do figure there as well. In the reception of HAHK and of music television, however, the idea of reality as being supported by something “not so nice” does figure. While the ways in which this is demonstrated is a far cry from the “real-is-nasty” claims that are so widespread in more recent reality programs and in soap operas, in order to assess how realistic (or not) a media text is it is useful to see how subtly audience members express their beliefs about what is lacking (morally or socially) in real life.

Despite the fact that Western-style “realism” is not a preoccupation of audiences when it comes to Indian cinema, it is instructive that discussions about how real(istic) HAHK was figured to a fair extent in my interviews with viewers. Nevertheless, casual comments about the movie, usually from my mass communication students at the University of Hyderabad, were often critical about the lack of realism in the film, and even about the lack of effort thereof (I still recall one student’s comment that the film was so contrived that even the backdrops in some sets were mere paintings). Yet, when I conducted my interviews, it was clear that audiences were invested in HAHK not just as a pleasurable experience, but as something that was real. I have discussed elsewhere four dimensions along which audiences believed in HAHK as real (Juluri, 1999), but in the present chapter what is most useful to consider is what the audiences anchored some of these beliefs on; and in the examples below we shall find that claims of reality are based on an assumption that reality is somehow unpleasant.

One participant in my study, for example, says that the family in HAHK is “too nice and idealistic to be real,” a sentiment echoed in various forms in various interviews. In another context, a participant observes that HAHK’s ideal family is appealing because families are facing various difficulties in real life. As middle-class viewers of cinema, their reading of idealism may not be surprising, considering how Indian cinema’s characteristic lack of attention to formal realism, or even to narrative realism, figures as a problem in popular reception. However, given the usual reticence with which class issues are discussed in everyday life, it is interesting to find conscious and explicit claims about realism that are based on HAHK’s depictions of class relations:

[It does not have] the usual kind of escapism [. . .] the driver–daughter romances.

HAHK was more natural, because both families were middle class. Other films show interclass relations.

The first comment absolves HAHK from the commonly made charge that Indian popular cinema is usually escapist, and it does this on the grounds that the characters in HAHK all fall in love and get married according to their station in life. The second comment is even more interesting in its use of the word “natural” to describe how romantic or marital relations are conducted in real life – which is mostly along intraclass rather than interclass lines. Both comments thus make the claim that it is precisely by reinforcing class rigidity that HAHK achieves a greater degree of narrative

realism than many other movies. The assumption, of course, is that interclass relations, or “driver–daughter romances” (a reference perhaps to the sort of “angry young man” movies that dominated the 1970s and 1980s, which featured a working class hero who worked as a driver for a rich man and fell in love with his daughter, usually following a rather misogynistic taming-of-the-shrew sort of courtship as well as a violent rendering of physical and social justice to the father-in-law to be), are only prevalent in movies and are seldom seen in real life. It may be the case that a middle-class background has something to do with finding reality in such a narrative. HAHK, in retrospect, was perhaps a precursor to a number of popular Hindi films since the 1990s, which marginalized class issues. With its careful etching of characters into their places (older brother, quiet and sober, marries older daughter of proposed family; younger brother, smart-alecky, marries his perky counterpart in his sister-in-law’s younger sister; sidekicks marry each other; and so on), HAHK addresses class the way middle-class Indians perhaps see it in their real lives, and it creates for its narrative a certain kind of representational authenticity.

Class also figures in claims to realism in the reception of music television programs, although the use of “reality” in this context seems to lend itself to a more benign form of appropriation in middle-class readings, as I show in the following section. However, what is relevant from this study is the fact that reality is once again seen as being authenticated by the breakdown of something; in this case, the breakdown of the ideal of accuracy. One participant, for example, feels that music countdown shows are realistic precisely because of the evident ignorance of those who participate in them:

Sometimes they’re just showing interviews, they don’t know what’s going on in the music world. Most of them, *ye picture mein hero koun tha?* [who was the hero in this picture] They think Urmila is same as Madhuri Dixit, something like that. The reality comes out.

This statement, made in the context of a discussion about music countdown shows that featured on-the-street interviews (often called “public” shows at the time), highlights an emerging tension in the ways in which viewers were making sense of new discourses about participation and popularity on commercial television in the late 1990s. When I conducted my interviews, there were nearly three dozen music countdown shows on satellite and cable television, and the genre was underscored by a pervasive play on the idea of the public (one such program was called “Public Demand,” and the interviewee above was speaking in response to the viewing of a clip from this show). In my interviews I found that there was considerable negotiation around the veracity of the countdown format itself – the question was whether the rankings for a song really represented something “real.” Participants were aware of the allegations that were often reported in the press about producers of countdown shows being sometimes subjected to pressures and favors from film and music producers in order to promote the latter’s songs in their rankings. One participant

questions the veracity of countdowns on the basis of their plurality, wondering how a countdown could be true when so many countdowns say they are true yet feature different ranks for their songs (often the same Bollywood hits). In another context, participants in my study also engaged with questions of realism in the context of the mannerisms (particularly accents) of VJs, many of whom had become celebrities among young people. Underlying all of these, though, was an emerging sense of self-consciousness among audiences, as being part of something called “the public” – which was spawned on the one hand by the pseudo-populism of privatized broadcasting and, on the other, imagined to grow up after globalization (imagined, that is, by the first generation of television viewers in India, in its popular desires). Statements like the one quoted above suggest that, while audiences are not naïve enough to accept at face value claims of reality (which in this case are ensconced in the idea of the public and in the countdown format), they do find and enact competences that enable them to lend meanings, in this case of realism, to what they watch. The questions this poses to researchers are how reality matches up to authenticity in audience readings; whether these readings are associated with anything unpleasant (classism or ignorance in the case examined in my study, or explicit nastiness, betrayal, anger, or aesthetics of dirt in the case of the more recent reality shows); and what the implications are for the meanings audiences give to their world.

Reality as Something Nice

Despite the overwhelming equation of reality with nastiness in media discourses, there are instances, in the moment of reception (and its subsequent study) rather than in the media discourses themselves, when audiences make claims to realism not on the basis of a breakdown in niceness, but on the basis of a belief in the decency of people and things. While it may be tempting to ascribe this to a heartening faith in human nature among Indian audiences, one could also make the argument that the moment of revelation of goodness in media narratives is far older in the Indian popular experience than in the reality show. Indian cinema has long been associated with a narrative tradition of moral recognition as a moment of closure. It may be said that what has made Indian movies “real” to their audiences is not so much a code of realism in a modern or technical sense as the emotional experience of involvement with the plight of the characters, culminating in a revelatory climax that involves a moral restoration of truth and dignity for previously misconstrued and mistreated characters (Juluri, in press). One might say that what we are speaking of here is nothing more than a “happy ending,” so typical of money-driven cinema, be it Hollywood or Bollywood, and it is easy to criticize such tales as nothing more than escapism or ideological deception. But the niceness assumption in popular Indian media and its reception deserve some inquiry into their role in audience reality-making.

Despite the occasional comment – such as the one discussed in the previous section, which measures the realism of a film by contrasting the niceness of its characters with people in real life – the reception of HAHK very much involved the deployment of belief in the niceness of things; people, families, and broader imagined communities, like those of nations and faiths. It is instructive that most participants in my study did not just view the exuberantly joyous and immaculately decent family in HAHK as just an “ideal” family, by contrast to a less than happy and decent “real” family. Instead, they saw the family in the movie as representative of how families really were. One participant (the same person who coined the colorful “driver–daughter romance,” the touchstone of realism discussed earlier) took issue with me during an interview when I used the word “utopian” to describe the family environment of HAHK. He insisted that it was not “utopian,” because utopia implies an object of fantasy, something that is not real. HAHK, and presumably the busily cheerful domestic heaven it depicted, were no Shangri-La for him. Instead he argued that what HAHK depicted was the “golden age” of the family: “Our families may have been like this [. . .] [HAHK] represents the Golden Age of the family, not necessarily a ‘dream’ but a golden age.” It may be easy to dismiss such views as middle-class nostalgia, or even as fantasy; but to do so would be an inaccuracy, given the fact that participants such as this one claimed to live in extended family households during their own childhoods, decades ago. Nor was such a perception confined to middle-class or privileged participants in my study. Working-class participants, some of whom were recent migrants to the city, also identified with the family members of HAHK, although their reference was not necessarily a distant past, but a more recent one: the life they had left behind in their villages. Class, age, and urban experience all seem to have played a role in this sort of interpretation. Younger participants who had experienced nothing but an urban, nuclear household environment their entire lives also seemed to see HAHK’s happy family as not necessarily unrealistic, but as something that they had missed out on in their generation.

The question of what exactly in HAHK made so many viewers feel invested in the reality of its depiction of happy family life is an important one, and it lends itself to numerous ideological analyses. I turn to some of these issues in the final section of this chapter; but suffice it to note now that the perception of reality that is at work here is not only a textual property of the film; it also reflects cultural competencies that are based on the life experiences of the audience. Such an interplay of seemingly unanticipated readings of reality, stemming from cultural competencies and from ideologically loaded texts, was also evident in my study of music television audiences. The two themes I examined in the reception of music television, the representation of the public on the one hand and the representation of national identity in an emerging global context on the other, indicated belief in a positive sort of reality, expressed in various ways. In general, reality was often ascribed to public shows and music countdowns on the basis of their interclass composition. Although my own view was that such representations tended to orientalize working-class figures for the consumption of largely middle-class urban music television audiences, the zeal with which numerous

middle-class viewers sought to claim an egalitarian sensibility suggests that they saw the public as something that spanned everyone, almost as if talking about class was somehow not polite. In the case of national themes, a subtler reality claim came into play, one that I did not anticipate on the basis of my textual readings.

If HAHK was the definitive post-liberalization Indian cinema, then Alisha China's *Made in India* was perhaps the definitive music video of the 1990s. *Made in India* was the first music album to achieve sales on a par with film music albums (cassettes and CDs of songs from Hindi and other Indian language movies), and its video achieved extensive airplay on MTV, Channel V, and various other music television channels. Coming as it did in the wake of years of rapid and intense globalization, its repetitive pop nationalism and its lyrics, its narrative, and its imagery about Indians finding success in a world full of other countries seemed to tell an important story about how Indians were thinking about themselves in a new media and social environment. The video features a fairy tale setting: it tells the story of a princess who is being wooed by princely suitors from different countries; she turns them all down and very nearly loses hope of finding a perfect match, when finally a successful suitor arrives in a box labeled "Made in India," and they all live happily ever after. Bright, colorful, exotic, and festive, *Made in India* would seem to media students to be a classic example of present-day orientalism (although I prefer to call it "self-orientalism"), with its snake-charmers, tigers, soothsayers, and other fantasy elements often seen as typical Western stereotypes of India. Despite the obviously fantastical aspect of its visual experience, audiences seemed to derive a sense of deep meaning from it. *Made in India* was seen by some participants in my study as not just any song, but a song that genuinely represented who they were. This authenticity was also seen as being different from a suggestion I had made, that perhaps *Made in India* was appealing because it had patriotic sentiments. It was not patriotic, these participants insisted, because patriotism is usually what one is forced to feel, usually by authorities. *Made in India*, on the other hand, was just who they were; as human beings, as husbands and wives, as Indians.

It may be easy, once again, to ascribe these perceptions to some textual properties of the video (the lyrics do repeat the word *dil* ("heart"), which many participants spoke about as an essential aspect of the Indianness this song represented to them), but key here is the assumption that audiences make about their niceness. The self-congratulatory part of their claims may not be surprising, but it must be acknowledged that the reason why participants see themselves as represented in this video, the reason why they find it real is precisely that they do not see it as blindly validating their virtues. As some participants noted, *Made in India* sets up a competition, fair and square, in the tradition of the *swayamvara* (a ceremonial practice of a princess choosing from a number of suitors). It is a liberal, open competition, and suitors will not be debarred on the grounds of race or national origin (although one might notice, as is the lot of media students, that the princess rejects the Caucasian suitor with just a wistful look and the African suitor by turning her face away altogether). The implication, as some of my participants observed, is that the video is not exhorting the virtues of

Indians *per se*; it is only advocating the choice of a mate with a “good heart,” and the narrative clearly shows that anyone, not just Indians, can have such a good heart. Finally, of course, the Indian wins – once again, not because he is Indian, but because he meets the standards of the international good heart competition. As naïve as this reasoning may sound to the critical scholar, it may not be far-fetched to note that there is a commendable quality in the effort, in the universal aspiration, as it were, shown by these young Indians to make sense of their nation and self in an emerging global context. If it was the perceived niceness and worthiness of India (even in an imaginary marital marketplace) that made *Made in India* seem real to them, then that is as instructive to us as the broader media discourses about the real as being something not so nice.

Reality as Religion

Given that audiences seem to assume that what makes a media experience real is its representation of niceness sometimes and of things that are not so nice on other occasions, how does one evaluate the question of what reality means to media audiences in general? I turn in this section to some insights from an ongoing study of mythological cinema, and I shall also take a closer look at examples from the previous studies that illuminate other relevant instances of how, in their own terms, audiences substantiate claims as to what they think to be real in speaking about their media experiences. While traditional religion is indeed a relevant concern in some of these cases (especially that of mythology), I call this section “Reality as Religion” rather than the other way around because I wish to make a point: cordoning off only certain beliefs or subjects as religious (say, in this context, “Hindu”) not only essentializes the borders of what we think religious faith to be (and this becomes doubly problematic in partially secularized contexts like India, where “religion” and “culture” are not easily distinguishable in everyday life), but it ends up privileging the not-religious as somehow “more real” and more important. My point is that “reality” in general may be seen as a religion; everything that audiences believe about themselves, the world, and the media (which permeate the former two) holds water on the basis of some faith (which may be sustained by reason, or it may not); and audience studies can teach us about the promises and perils of such beliefs. When music television audiences say that they think of globalization less as Western culture invading India and more as India going out triumphantly to win the respect of the world, when viewers of HAHK say that HAHK represents what it means to be truly Indian regardless of the class, caste or regional specificities of its characters, and when viewers of mythological cinema say that a certain genre of cinema is more real than another, what do they mean?

It is not unusual to find instances in audience interviews that are quite explicit in showing how participants make up their mind about something. These are instances

where audience members do not necessarily make a claim to reality on the basis of an assumption that reality is either nice or not so nice, but they invoke instead reason, evidence, and corroboration in numerous spontaneous and sometimes subtle ways. In the case of music television reception, for example, numerous participants emphasized the “naturalness” of public shows by contrasting how the people on the show were simply there, and these shows “were not like they just get these people together to be a part of it.” In the same vein, another participant says that shows like these may be more representative because there are many people featured on them, as opposed to only one. In this case, it is plurality that is of importance, even if it is an assembled one; and the plurality is invoked to ascribe value to the premise of the program and its attendant pleasures. If the presence of many people (“so many people are liking that song that is why it has to come”) is one common validation given by music television audiences, the epistemological force of visual representation also appears as a justification, albeit in more complex ways. Talking about *Made in India* as a video that was made largely for non-resident Indian audiences, one participant mentions that there are many Indians who lived abroad, and he validates his claim, rather unconsciously, by noting that he saw it on *Antakshari* (a popular music game contest) when it was filmed before live audiences residing outside India. Television, in this case, functions as its own cultural capital in representations of reality; one can speak about things one has not directly or physically experienced by invoking its content as evidence.

At the same time, there are also instances when audience members invoke the constructed and possibly distorted nature of television as a mediation of reality: “Whether it is really hit or they are making it hit” (about the producers of music countdown shows), “they should be like a realist in [presenting] [. . .] though it is a preplanned joke it should be presented as if it is spontaneous” (about how VJs should perform). Audiences do not see television as nothing but a transparent window upon reality. They are familiar with the cultural competencies of criticism and expectation, and they express them quite clearly, in order to convey what they think is an appropriate standard of performance for the producers and entertainers of television. VJs, for example, need to appear to be spontaneous, even if what they are saying has already been scripted for them. Along the same lines, there are also instances where similar assumptions about the ontology of television are being applied in a critical manner to performers whose work has not lived up to audience expectations. Some participants criticize VJs for “faking” American accents (although at the time of these interviews I felt that such accents were also somewhat normalized, and some participants would not have noticed them if I had not brought the matter up).

Audiences may negotiate the reality of television and of the world it represents, in ways that belie simplistic assumptions – either about their cooptation into a linear “seeing is believing” sort of hegemony, or about a resistance to hegemony born out of audience members’ ability to question television’s transparency as a medium. As the codes of television (and media) audiencehood become widespread and naturalized over time, we can find instances of both tendencies in the findings of contemporary research.

What is important for an understanding of the nature of reality, however, is the way mediatized and other realities have melted into one another in the landscape of daily life in many globalizing societies. As Justin Lewis (2004) writes, media do not just litter the landscape anymore, they are the landscape. By extension, one might also say that one is not just an occasional audience member anymore; it might instead be more useful to talk about audiencehood as a part of the global condition, with its mediations, memories, myths, and more, all making engagement with the media a reality, regardless of how one lives it or what one makes of it. Television's role as a center of new imagined locations emerges even when its authenticity is in question. As one participant in my music television study said, the reason why Indian VJs affect an accent is that they are "catering to a global audience," and people in the Philippines or Singapore may not understand an Indian accent. Globality itself is given the status of a reality here.

What then, is the nature of the reality that is ascribed to the gods, who have been such a pervasive feature of the Indian mediascape from the earliest days of cinema until the present? It may be fair to say that tales of the gods have been so pervasive and persistent that to cordon them off as sectarian religious media may not be entirely accurate (sectarian media do exist, too – for instance in the multimedia and literature brought out by religious organizations). To believers, as we might call them, movies and TV serials about Krishna or Rama are not just works of fiction, in the same manner as, say, a serial about Spiderman or Superman: although some confusion might be around the corner for a new generation of Indian children, reared on a new cultural diet that reinvents the gods in such a pop-cultural idiom. At the same time, viewers of such media forms do not necessarily see movies or serials about the gods as non-fiction, like the documentary or history – although that attitude began to change a great deal since the 1980s, when the TV epics *Ramayana* and *Mahabharata* reimagined popular religion as a form of national self-discovery (Mankekar, 1999; Rajagopal, 2001). In some ways the question itself is an awkward one, importing as it does epistemological and ontological dichotomies that have not *not* occurred to the Hindu mind, but have indeed been avoided historically as an exigency of postcolonial survival (Nandy, 1983). I take the view of religion as being both time-honored and reimagined from generation to generation. The words, images, and practices that comprise Hinduism may be ancient, but their relevance, meanings, and implications have been neither essentially unchanging nor entirely fluid and meaningless. Since the first encounters with colonial modernity – and, specifically, with its technologies of mass communication (the printing press, the cinema) – the popular experience of Hinduism, and its tales of the gods, have been retold in ways that deserve analysis rather than a reductive accusation of false ideology. Film scholars (Das Gupta, 1989; Dwyer, 2007) describe the piety with which India's first film audiences encountered the miracles of their gods in Phalke's movies in the early twentieth century. More recently, tales of domestic piety and ceremony also surrounded the reception of Doordarshan's 1980s serials. Did audiences really believe that the gods were before them? What sort of reality was that? And did it single-handedly cause the phenomena of Hindu chauvinism, extremism, and nationalism?

Thus far, my limited study of audience interpretations of mythology suggests that what viewers experience and articulate in their viewing of such films is something that is not peculiar to religion (and this is, in any case, not easily separable, as mentioned earlier) but is constructed as a negotiation of a particular nuance of media experience. Mythological audiences talk about mythological cinema as they would talk about media in general; as a form of mediation, of its constructedness, of its aesthetic choices, and the like. But at the same time there is also an evocation of something far beyond just media. To begin with, what is particularly relevant to the concerns of this chapter is the use of the term “realistic” in talking about mythological media. Like the discussion of public shows in my music television study, the audience discussion of “realism” occurred without my prompting. Participants employed the notion of the real seamlessly in talking about mythology. While this may not be evidence that compels us to accept that these audience members literally believe what these movies are depicting, the viewer’s response does point out that ontological claims are not irrelevant. As one participant writes: “Mythological movies of the black and white era appear to be more realistic than the color ones. Introduction of color and technology diminish some of the mysticism that one associates with the mythological stories.” Does the term “realistic” here refer to a comparison with a physical reality? Or to a comparison with other texts? Or to an expectation about how the divine is represented in secular entertainment contexts, as opposed to ritually consecrated ones – like temples? Tellingly, such a contrast was made almost unanimously by participants, who valued the older, black and white mythological movies of the 1950s (which are often accorded a hallowed status as classics by generations of Telugu film audiences) over the big-budget color films that began to be made from the 1970s. The older movies are described by participants as “sincere,” “genuine,” “technically better,” and full of “charm” and “simplicity,” while the color films are described (largely accurately, if I may introduce my own aesthetic judgment here) as “theatrical, affected, gaudier, and louder” – and as “kitsch.” However, as much as these terms seem to relate to formal qualities of the texts in question, one can also find instances where a seemingly formal reading of the text blends into evaluations about what we might call the referent. In one comment about the Hindi TV serials of the 1980s, one participant rather summarily declares: “Hindi gods don’t look like god!” Although this participant acknowledges a possible bias implicit in being a native Telugu speaker, the spontaneity with which one evaluates what a god is supposed to look like is important. Once again, we might ask whether the expectation of what a god is supposed to look like is merely a cultural competency, acquired from the naturalization of certain codes of representation disseminated over decades by calendar art and cinema, or whether there a greater value to that sensibility too. Is the aesthetic of secularized sacred representation only a capitalist exigency, or are there other epistemic possibilities too? When audiences assume a certain kind of reality around such texts, is it the same as anything else in the media? Is it good or bad?

Conclusion

What audiences assume when deciding what makes a media representation of a god realistic may be far too ambitious a question to take on in the conclusion of a chapter. Even so, it is through this question that we may begin to understand where audience researchers could advance a project of critical scholarship, particularly in India and its diaspora. Indian media audiences may experience many meanings when they consume mythological texts; for some it may be a story, for others a lesson in history, and for others still a story that transcends the limitations of secular experience. However, the expectation of what a god is supposed to be like, especially in the context of a media representation, is best understood both as an aesthetic issue and as an ethical one. One of the participants in my study, for example, was quite aware that what gods are supposed to look like reflects a norm established in Raja Ravi Varma's paintings. But what sets apart an interpretation of, say, Krishna as a "character" and as a "god" is in how a movie or cartoon may depict his actions, as much as his appearance. In the popular devotional context in which mythology is consumed, the righteousness of a god's actions, be they social or interpersonal, becomes a crucial touchstone. It is not appropriate to take narrative liberties on this count, as one participant notes:

The later mythologicals were appalling. For one, they were gaudy and kitschy [. . .] But the worst thing was the changing of the basic story. Sometimes, the traditional protagonists were shown as villains and the villains as heroes, with utter disregard for the conventional notion of dharma and adharma [. . .] the connection with the original was lost.

A similar view was also in evidence in my interviews with some of the makers of mythological cinema. Writers, directors, producers, and actors (with very few exceptions) seem to approach the subject of mythology as if it represented not just a story, but moral instruction, even though this may be expressed as art, even popular art. What makes the gods real, in this sense, is not whether they look a certain way (although this is relevant), or whether there is historical evidence for their existence (although this has become a broader political debate since the 1980s), or whether their deeds are miraculous (although miracles are an important aspect of mythology and indeed piety). When viewers talk about the realism of mythology or the faithfulness a new movie shows towards the "original," they do not make so much a scriptural evaluation as a narrative one, placing particular weight upon ethical choices. Brooding gods beset with doubts and angst and all-too-human rage, of the sort depicted in the US comic books *India Authentic* and *Ramayana 3000* presented by Deepak Chopra and Shekar Kapoor, do not make for popular reception, on the scale achieved by mythological movies or the revered Indian comic book series *Amar Chitra Katha*.

Despite the moral imperative that informs the production and consumption of mythological texts, there is no denying that this imperative has been compromised by the historic ascendancy of political and commercial interests. While the appropriation of popular religion by one group of right-wing political parties in India is now well understood in cultural studies, there has also been a fair degree of change in the way in which the tales of the gods are now told, especially in the newer media, like satellite television. Many of the animated mythological cartoons that have been made since the 1990s, for example, fail to weave the mood of enchantment and instruction that characterizes some of their predecessors. The gods are now cartoon superheroes, combining their traditional tales of miracles and adventures with new activities, like surfing and high-fiving. At the same time there is a belabored attempt towards pedagogy, as if a litany of “facts” about the gods would help parents inject cultural heritage into their children as this generation grows up in a far more globalized world than that of their parents. The conscious creation of a cultural identity seems ominously poised to subsume the pleasures and delights that once came with such an identity. Pleasures and delights may still ensue from the consumption of mythological media, but these may in the future find themselves anchored less in moral guidelines and more in slogans. Future audiences may find a sense of reality not in the wisdom of mythology but in its possession, in every sense of that word.

However, the layering of mythology with a discourse of identity is still not the only factor at work in the broader experience of media audiencehood in India. As this chapter has hopefully shown, there are numerous ways in which audiences negotiate a sense of reality in their reception of media. Sometimes a media representation appears to be realistic because of a breakdown in goodness. Sometimes the converse happens. In any case, one may also speak of the reality that audiences imagine as a sort of religion, premised on the possession of ontological beliefs rooted in epistemological practices that may or may not be drawn from media discourses. However, as we witness the historic descent of millions of people into conditions of audiencehood that are ever more intense, narrow, privatized, and self-directed, we must take seriously the perils posed by this broader cultural trajectory. Audiences are surrounded by more media than ever before, but what happens when all that the media do is reflect each other and their claim for reality offers nothing more than each other’s epistemic bases? Indian audiences once found a movie to be realistic regardless of its aesthetics, if goodness was narratively recognized. Now realism requires mastery of a new set of cultural competencies, which cynicism may even expose, but the culture cannot extinguish. Reality now issues forth when a text represents the worst of human behavior and the most disgusting of aesthetics, such as the sepia-tinted sewage scenes of *Slumdog Millionaire* (another film that was lauded by many for its “realism”). What happens when audiences believe that human nature is essentially nasty and all else is only a pretense? At the time of my studies there were clearly exceptions to this and signs of hope, as audiences negotiated the discursive and the modern on the one hand, the non-discursive and the non-modern on the other. Audience researchers, and cultural studies scholars in general, would do

well to recognize both these elements. The media industries have taken to calling “reality” their particular view of human nature, and they have been enormously successful. Critical media scholars have fallen short, by remaining confined, in their critiques, to the positions and politics of identity and by failing to advance their critiques into popular beliefs about human nature. If it is reality itself that is at stake, we need to speak its language too, and the best way to learn its vocabulary is by taking it from the audiences who believe in it. Future audience researchers, especially those preparing to address the growing global genre of “reality television,” will do well to open up their own paradigmatic horizons and to build a stake in taking their findings and critiques into the broader discourse beyond academia as well.

“Unity in Diversity?”

South African Women’s Reception of National and Global Images of Belonging

Shelley-Jean Bradfield

ABSTRACT

The public television endeavor in South Africa to translate a multicultural ideology into programming addresses the plurality of citizen-viewers in the country through the stipulation of language and local content quotas, among other corporate objectives. But the way women negotiate television’s attempts to reproduce a shared sense of national identity and the manner in which they view television as a means to participate in the national public sphere have not yet been assessed. This chapter intervenes by investigating the heterogeneous manner in which audiences utilize global *and* local programming in their identification as national subjects. First, white women offer an antagonistic response by distancing themselves from nation-building rhetoric and by expressing preferences for programming from other national contexts. Second, older black women collaborate by identifying with programming on television that they believe addresses issues of the nation directly. And, finally, a mixed racial and ethnic group of women demonstrate more ambivalent or critical responses to programming designed to bring people together around national concerns. The paradoxical responses of women to national programming suggest the exclusive qualities of the lived experience of multiculturalism versus the imagined success of the televised national project.

State discourses of nation-building in South Africa are predicated on the notion of multiculturalism as an ideology that enables the incorporation of previously segregated citizens into the embrace of the nation's newly founded democracy. Public television's endeavor to translate this ideology into programming content addresses the plurality of citizen-viewers in the country through the stipulation of language and local content quotas, among other corporate objectives. But scholars have yet to assess how women negotiate the South African Broadcasting Corporation's (SABC's) attempts to reproduce a shared sense of national identity, and the manner in which they view and interpret television as a means to participate in the national public sphere. While a bulk of the research concentrates on the changes in television broadcasting since its inception in 1976, a few studies, outside of institutional marketing research and social science health communication, have examined how audiences in South Africa construct their identities in relation to the television programs they enjoy or reject. Moreover, the few reception studies that exist center on either the reception of global media (Salo, 2003; Strelitz, 2005; Tager, 1997), or they delve only into the reception of specific local South African television texts (Milton, 2005; Roome, 1999). This chapter intervenes in the field of knowledge on television in South Africa by investigating the heterogeneous manner in which audiences utilize local *and* global programming in their identification as national subjects.

In May 2007 and October 2008 I interviewed 25 women in South Africa about their television viewing practices; their responses demonstrate the extent to which viewers differ in their reception of televised projects of national unity. For instance, Liso, a young black college-aged student, spoke of her identification with the themes and characters of two national soap operas:

I love South African soapies [slang for soap operas] – yeah, I love especially *Isidingo*. *Generations* is now losing track but yet I love it, I love it a lot. But yeah, I'm aware of the fact that they just try and portray everyone to be rich and famous [. . .] [but] I just love the show.

Taking pleasure in soap operas that are designed to bring together a broad viewing audience around issues of nation, Liso accepted the objectives of the shows even though she critically acknowledged their lack of relevance to the South African context. Yet, even as Liso embraced the goal of bringing citizens together around common television shows, Darlene, a middle-aged white mother of two, expressed her dismissal of national productions for what she considered to be their inferior production qualities:

I don't feel [South African shows] are up on standard [. . .] it may be a perception of mine but you almost can just immediately pick up when it [a television production] is [South African]. You can switch it on [and] without even seeing a number plate of a car, you can see whether it's a South African production or not a South African production, and I just veer away from them.

Darlene's wholesale rejection of national television images raises the matter of imported programming, which she prefers to watch and identifies with closely.

Considering how women identify with or reject national *and* imported programming, I employ the related concepts of cultural proximity (Straubhaar, 1991) and multiple proximities (La Pastina & Straubhaar, 2005) as frameworks for examining how some viewers selectively identified with a national sense of self that was (re) produced through local public television programming, whereas other viewers resonated more deeply with imported programming, which extended the sense of belonging to a space beyond the nation. Described as a preference for broadcasting content that appears to be most similar or proximate to the experiences, context, values, language, and culture of a specific audience, the concept of cultural proximity predicts the popularity of media content that stems from similar geolinguistic or geocultural regions. Extending this theory further, the concept of multiple proximities illuminates how audiences might perceive international media products – among other possible proximities – as more proximate to their experiences, even when national versions of such texts are available. These two approaches to reception demonstrate, as Iwabuchi (2002) argues, that a sense of proximity is not inherent to or contained within the media text, but arises due to the strategic choices that audiences make in their judgments of proximity/similarity or distance/difference.

Examining women's responses to both national and imported programming while making particular reference to the national case study of *Home Affairs*, a domestically produced program, the present study suggests that viewers negotiated national belonging in the context of this show in one of three ways: women responded antagonistically to the sense of national belonging represented in the show, or they collaborated by identifying closely with *Home Affairs* images of themselves and their concerns depicted on the national screen, and/or women took up a critical position by simultaneously sympathizing with and supporting the national project articulated in *Home Affairs*, even as they also expressed preferences for shows from outside the nation. While closely registering with Stuart Hall's (1973) analysis of audience members' responses to news and current affairs programming as taking up "preferred," "negotiated," or "oppositional" positions, this study also parallels Ien Ang's (1982) analysis of Dutch viewers of *Dallas*, some of whom experienced pleasure, while others articulated displeasure through references to the ideology of mass culture, and others still employed a position of ironic viewing that negotiated criticism against mass media products yet admitted to the viewing pleasures of *Dallas*. Accordingly, I argue that, while the South African state's adoption of multiculturalism as a mechanism for unity in diversity is being translated onto the small screen, women across identity groups report varying degrees of national identification, degrees that often correlate with their positions of class, race, ethnicity, and education.

Analyzing the reception of television texts *within* the borders of South Africa as well as the transnational reception of texts from the United States originating *outside* of the country, I first explore the ways in which white women distance themselves from nation-building rhetoric and express preferences for programming from other national contexts. Second, I take into account how older black women identify with programming on the South African Broadcasting Corporation (SABC) that they

believe addresses issues of the nation directly. And, finally, I attend to a mixed racial and ethnic group of women who demonstrate more ambivalent responses to the pedagogy of a programming that has been designed to unify people around national concerns. I attempt to open up a space for women's voices by integrating their words in quotations throughout this chapter: this is the provenance of all the quotations where no source is given. The paradoxical responses of women to national programming gives us glimpses of the exclusive qualities of the lived experiences of multiculturalism versus the imagined success of the televised national endeavor.

The *Home Affairs* of South African Television

Following the lives of nine women in the first series and of six women in the subsequent series, *Home Affairs* asserts its uniqueness as a show by claiming to be "a drama series for women, about women and entirely produced and created by women with an all female writing and directing team, as well as a female director of photography – a first for South Africa" (SAARF, 2008). As the show is airing during adult viewing time, both its content and its scheduled broadcast time emphasize its unique feminine voice, even though the show did employ creative personnel who are men – including writers, directors, a director of photography, and numerous other production staff – and attracted an audience of both men and women. While *Home Affairs* is typical of other nationally produced television texts that incorporate a diverse range of characters and languages, its focus on "the connections people share with one another, unwittingly or not" is more unusual (SABC, 2010). The extent of these connections is exemplified first through Thandeka (Nthathi Moshesh) – executive of Young Blood, a nongovernmental officer (NGO) – who admits to being Katleho's (Lerato Moloisane) biological mother despite leaving her from birth in the care of Thandeka's older sister Nonhlanhla (Nomsa Xaba). Moreover, by offering sports scholarships (through her NGO) to young women from economically deprived situations, Thandeka becomes involved in Vuyokazi's (Brenda Ngxoli) dream of escaping poverty. In response to Thandeka's revelation of her status as a parent, Katleho, a young black woman, turns for comfort to Katherine (Jessica Haines), a white friend from childhood, – a surprisingly close relationship considering their diverse racial identities in the context of a history of segregation. Finally, making every effort to utilize her resources to tackle difficult social issues such as poverty and lack of education, Shanti (Sorisha Naidoo), an Indian medical doctor, offers state-sponsored assistance to Cherise (Therese Benade), a young white woman whom she suspects of being involved in an abusive romantic relationship.

Although multicultural casts and settings are typical dramatic conventions taken up in South African dramas, sitcoms, and action series, their incorporation into television is part of an intentional objective to help reunite citizens who have emerged out of a history of segregation. State and institutional discourses of nation-building and their translation onto the small screen are crucial issues that inform the multilayered

responses of women to *Home Affairs*, their sense of its proximity in the matter of defining citizenship, and their acceptance or refusal of women's place and status, as these attitudes are defined through television images of the nation.

To facilitate a discussion about plot, themes, and characters in *Home Affairs* and to encourage participants to think more generally about their television pleasures and viewing habits, including their use of national and imported media content, I screened the thirteenth and final episode of the first series of *Home Affairs*.¹ This final episode was staged as a drama that follows the unexpected interconnections between women in South Africa who hail from diverse backgrounds, locations, cultures, and age groups. Produced by Penguin Films, an independent production company, *Home Affairs* aired on SABC1, a public service channel of the SABC, which is in turn the oldest and largest television institution in the country. The one-hour drama played on Thursday nights for 13 weeks, in competition with *The Apprentice: SA* (2004–) on SABC3, the SABC's commercial channel, and with *Desperate Housewives* (2004–) on M-Net, a subscription-based television service. On the basis of its popularity and of the nation-building objectives that it fulfilled,² *Home Affairs I* was rebroadcast in early 2006 and recommissioned as a second series in 2006; a third and fourth series were commissioned and broadcast in 2007 and 2009, respectively.³ Each series was composed of 13 episodes, except for the fourth and final series, which comprised 26 episodes each.

Apparently illustrating Straubhaar's (1991) notion of cultural proximity, *Home Affairs* garnered approximately half of the market share during its premiere on September 15, 2005, in spite of competing with the US-format adaptation of *Apprentice SA*, broadcast on SABC3, and with *Riding in Cars with Boys* (2001), a US feature film broadcast on e.tv (this is a privately owned, free-to-air television company). Also demonstrating a partiality for nationally produced genres besides dramas, *Generations* (1993–), a South African soap opera broadcast on SABC1, attracted half of the national audience in spite of competing with the long-running US soap opera *The Bold and the Beautiful* (1987–). Moreover, by consistently attracting a market share of 40% or more across its first, second, and third series, *Home Affairs* indicates audience loyalty for national television shows, particularly as the balance of the available free-to-air audience was spread over three other channels, namely SABC2, SABC3, and e.tv (SAARE, 2008).⁴ Notwithstanding the show's success, however, the market share average does not address the ways in which identity categories factor into audience preferences, or the ways in which some viewers regarded *Home Affairs* as culturally similar and appealing while others overlooked the possible pleasures of this text and assumed identification with imported shows.

Imagining and Mediating the Nation

Expanding access to the public sphere with the transition to democracy in 1994 from an apartheid state, the Government of National Unity and, later, two African National

Congress (ANC) governments represented by Nelson Mandela and Thabo Mbeki defined nation-building as “facilitating processes of exchange and dialogue between South Africa’s different cultural, regional, and linguistic communities” (Barnett, 1999). Recognizing the demographic plurality of racial groups, ethnicities, and languages among other things, the post-apartheid state envisions accommodating this diversity through multiculturalism, or the equal treatment of all people from different social locations (*ibid.*).⁵ Although the term “multiculturalism” is seldom used in South African policy debates, the existing cultural diversity presupposes the importance of considering how the state designs and regulates policies concerning diversity and the commonsensical set of beliefs that South African society *should be* organized around the notion of cultural pluralism. Yet the implementation of multicultural policies and ideologies has been hindered by multiple obstacles to its realization (Brown, 2000). For one, the notion of ethnicity as primary identity required for a political community harks back to primordialist ideas of ethnocultural nationalism and assumes citizens’ need for separation from other ethnic communities. Second, while multiculturalism emphasizes the rights of collectivities, when individual rights are subordinated to minority group rights, the potential for individuals to thrive is considerably reduced. Third, even though multiculturalism envisions a society of shared power and resources, minority communities often cannot agree on how to distribute these resources. Finally, even as multiculturalism emphasizes the protection of minority groups, this ideology marginalizes disadvantaged individuals from within ethnic majority groups and thus undermines the possibility of equality through diversity.

Confronting the challenges faced by the multicultural nation, the South African Constitution seeks to guarantee the equality of language groups, and policies of language equity have been expanded to include mandates for broadcasting institutions. In particular, the SABC is expected to “play a part in healing divisions of the past; to promote respect for democratic values and human rights; to supply information that allows citizens to exercise their rights, and to reflect the rich diversity of a united South Africa” (SABC, n.d.). As part of the nation-building agenda, the regulatory agency of broadcasting and telecommunications, which is the Independent Communications Authority of South Africa, has outlined local content quotas for each broadcaster, including the SABC – whose two public service channels shoulder the bulk of public service and local content programming in the country.⁶ Corresponding with the “African Renaissance” – that is, Mbeki’s version of multicultural nationalism, in which South Africans rediscover and recreate images in their own likeness – local content regulations not only specify the amount of national programming on the schedule per channel, but also spell out local content quotas per genre, so that South Africans see themselves and their experiences to be constructed and reflected, rather than modeling themselves off the lives and hopes of people from outside the country. Yet, although multiple national identities are promoted through policies, regulation, and programming, the increased dependence of broadcasting on advertising and on its objectives limits the success of the project of unity through diversity. Because

television, and the SABC in this instance, is not the recipient of significant amounts of public funding, programming is commissioned to deliver the largest possible number of consumer audiences to advertisers rather than principally to serve the diverse interests and needs of viewers as citizens (Barnett, 1999).

Familiarity Breeds Contempt

That *Home Affairs* appeals mostly to women who are young and not white seems to be a foregone conclusion of the white women whom I interviewed, whose ages ranged from 39 to 65. Highly educated, with one graduate degree, two undergraduate degrees, and a high school diploma represented in this group of four, these women agreed that the show explored themes and characters that targeted groups other than themselves. Mary, an upper-middle-class stay-at-home mother and wife, hypothesized that young black women and "colored" women who were less well educated might be the objects of this nation-building programming, while Marie, an upper-middle-class career woman, wife, and mother assumed that younger women in their late teens and early twenties would enjoy watching *Home Affairs* and thus assimilate its themes of uniting the nation. Interestingly, Darlene, a lower-middle-class working mother and wife, reasoned that the national project was directed at the working-class, as none of her middle-class acquaintances followed the show:

No people that I associate with [. . .] I think would watch that. It's not something that I would expect anyone in my peer group or social group to say, "Oh, did you see *Home Affairs*?" No, and definitely, I mean, I have exposure to Afrikaans people and I have exposure to non-white people, maybe it is a class thing, I don't know.

Yet, even as they imagined other citizens as the targets of nation-building rhetoric, these women identified somewhat with the themes of the show. Understanding the decision of Thandeka (a high-powered black executive) to look after a white abandoned baby as a gesture that was symbolic of the racial integration underway in South Africa, Grace empathized with Thandeka's prior economic and career decision to give her daughter Katleho away at birth, and she admired Thandeka's courage to adopt a white child later on, even though that would prove challenging in a racially stratified society: "It was so beautiful when Thandeka takes home Cherise's white baby [. . .] it shows realistic and future possibilities of integration." Marie also pointed to the theme of racial integration that she saw illustrated through Katleho and Katherine's friendship. Noting that "my children are friends with some black children at their school," Marie reflected on the positive effects of representing multiracial relationships on television. Acknowledging her sons' friendships across race, Mary reflected on the significance of the fact that her daughters did not cultivate relationships that straddled diverse identity categories ("maybe it is a girl thing not to have

good friends across race”), even though her theory flew in the face of Katleho and Katherine’s friendship. Significantly, Mary asserted that “races get on pretty well in South Africa” and that cultural diversity was supported through increasing instances of subtitled programming on television that depicted a range of racial and ethnic groups.

The historical pressure placed on rural black women like Thandeka to leave their children with other family members, so that they may find work such as “charring” in urban areas, was another storyline familiar to women.⁷ Mary noted: “[Katleho’s] being abandoned is pretty typical but it is not typical that Thandeka didn’t stay in contact.” Likewise, Darlene noted the historical theme of extended family caring for children of domestic workers, although she, too, contrasted the practices of her domestic help with Thandeka’s abandonment of Katleho:

I can only speak of [. . .] the exposure I’ve had to Edith [domestic worker] because she’s in that situation, and [to] Andre [gardener] who works here as well [. . .] [and in their cases] ‘so and so’ looks after the children – even if it is an illegitimate child. But you know that there is still involvement in the child’s life by the parents, so Thandeka’s absence in Katleho’s life [. . .] was a bit unreal to me.

Although the circumstances of *Home Affairs* were familiar to these women, they found the development of the storylines difficult to reconcile with their personal experiences.

Although these four women agreed that *Home Affairs* attempted to take up the South African experience through a social realism mode of address that was familiar to them, their explanations as to why they did not watch *Home Affairs* differed to some extent.⁸ Instead of finding pleasure in programming that directly resonated with their daily lives, these women preferred shows that they perceived as being not “overdramatized,” not “too intense,” not grappling with the “real problems” of South Africa, and as parading “beautiful people” with “stories that aren’t so close to home.” Besides criticizing second-language English accents as irritating, Mary felt that “local shows don’t hold high enough status among viewers in South Africa because they show such bad acting – more like stage acting. So local shows don’t have status when compared to British, US, and Australian programming. And South African issues are real problems.” As a result, she preferred viewing imported programming that delved into lifestyles and values to which she could aspire on the basis of her upper-class status and access to cultural capital: her competent use of English, her stimulating career and qualifications, and her frequent international travel (Bourdieu, 2001).⁹

Even though the show explored social transformation in a dramatic format, which Marie generally enjoyed in imported programming, the dismal tone and the representation of serious and often insurmountable social problems discouraged her from watching local dramas that leaned toward realism: “I would only watch *Home Affairs* to get a handle on what my daughters might be going through, and what other parents feel about Cherise’s pregnancy (out of wedlock), for example.” In addition,

assuming that the show only targeted younger women in their late teens and early twenties, Marie acknowledged that imported programming was more applicable to her life: "I prefer to watch shows with beautiful people and stories that aren't so close to home." Thus, while acknowledging the ways in which *Home Affairs* attempted to model "how to improve your life," Marie did not perceive these images as being relevant to her own life.

Darlene, who was the most articulate one about her preference for imported programming, remarked on the inferiority of locally produced television programming, which seemed out of tune with her life and exhibited low production values:

It's not [. . .] a natural filming for me. I don't feel they're up on standard, but they may be being done by an American producer, I don't know. It may be a perception of mine but you almost can just immediately pick up when it is. You can switch it on [and] without even seeing a number plate of a car, you can see whether it's a South African production or not a South African production, and I just veer away from them.

Besides critiquing the production qualities of local programming, Darlene also found the subtitling of multicultural programming alienating rather than inviting, and she experienced the content of South African productions as too upsetting:

Ja, first of all, [*Home Affairs*] was far too emotional for me. The initial reaction of [Cherise], the happiness level of her getting married was great, and it was excitement, and then that extreme total level and total letdown [of Daniel not showing up for the marriage and then beating Cherise] was, I could have switched off there – that's where I would have switched off.

Contrasting the emotional intensity of *Home Affairs* that she despised to *The Bold and the Beautiful*, a US soap opera she had watched since college, Darlene explained that she admired the powerful female characters on *The Bold* and viewed their lives with pleasure. She reported that she enjoyed the show even though she would never behave like these characters, and that she had become an erratic fan now that she had young children in the house. The cultural capital she possessed was demonstrated in the form of a college degree and of her having spent her teenage years living in the United States. This cultural competence facilitated her comprehension of, and appreciation for, slang, jokes, and historical references that tended to be nation-specific.¹⁰ Although Darlene did not possess the financial means to mimic the lifestyles featured on imported shows, she identified herself as upper middle class with regards to her social attitudes and aspirations, elements that distinguished her from other members of the lower middle class. As in Press and Cole's (2001) findings about how working-class women either identified with or resisted television images of themselves, Darlene posed as "upper middle class-identified," thereby criticizing the attitudes and behaviors of people of her own social rank and aligning herself with images of upward mobility. Further supporting Press and Cole's study, the upper-middle-class women in this study assessed the proximity of imported

programming positively, because it reflected adequately their lifestyles and social and economic ambitions.

White women's disinclination to watch nationally produced shows that speak to South African issues and concerns appears to emerge from their desire to avoid engaging with serious matters that pose as entertainment and from their peripheral sense of national identity, with the help of which they are able to overlook the realities of a large portion of the population as irrelevant to their own "imagined community." Explaining the ways in which national identities can frequently be described as fragmented, La Pastina (2003, p. 12) makes a case for "mediated and conflicting notions of the nation that can potentially alienate rather than integrate the members of the nation who are peripheral to the power structures." Even though white women have historically been linked to power structures in South Africa, a fact that distinguishes them from the rural residents of Macambira to which La Pastina refers, the deficit in national media representations to establish their significance to the nation works to distance them from any involvement in constructions of group loyalty to the nation. Consequently, at the same time as images of national realities and concerns are constructed for television programming, white women assume their peripheral standing in such "depressing" matters of national uplift and racial progress. As in other well-educated and wealthy audiences, these women construct identities that pivot around television cultures, humor, and lifestyles originating in anglophone countries outside of Africa, and in particular around programming from the United States. Developing a stronger sense of proximity on the basis of the cultural and economic capital that is represented in imported makeover shows, travel shows, dramas, crime shows, and soap operas, these women, and by extension all those with access to extensive cultural capital, distanced themselves from national television representations. They sought out instead experiences of belonging that described a sense of nation much closer to their own imaginings – ideas very different from those held by women whose responses resonated with the national programming, as will be discussed below.

Familiarity and Desirability

Differing markedly from the white women who rejected national programming as unappealing and gloomy, four black women with whom I spoke engaged willingly with *Home Affairs* and other nationally produced shows. Claiming to be fans mostly of South African soap operas and neglecting imported programming completely, all four women were long-term aficionados of *Generations* (1993–), *Muvhango* (1998–), and *Isidingo* (1998–), soap operas that speak specifically to the South African context.¹¹ Moreover, all four women had watched the bulk of the first series of *Home Affairs* and related the events on the show to their personal experiences and the broader context of developments taking place in the country.

Each of these women – single mothers between the ages of 39 and 50 – spoke at least three of the following languages: Tswana, Sotho, Xhosa, Zulu, English, and Afrikaans. Three of the women – Elsa, Ephie, and Adela – grew up in rural areas and relocated to a large city, where they found employment as domestic workers in wealthy white women's homes; they left their children in the care of family and were frequently sending financial support for them. The fourth and youngest woman, Yolande, had not relocated but lived in the town of her birth and labored as a domestic worker at a local high school. Adela and Yolande had acquired some high school education, but Elsa and Ephie only had a few years of primary school, the US equivalent of elementary school.

As mothers who had co-parented their children with the help of family and friends, all four women reacted viscerally to the act of Cherise deserting her newborn; Yolanda repeatedly queried "Where is the baby? Where is the baby?" while Elsa shook her head back and forth as she assimilated the abandonment. Immersed in other storylines as well, these women displayed more interactivity with the content and characters than any of the other participants in the study. When Nandi expressed her joy by ululating and doing a quick dance at the departure gate of the airport on her way to London, a journey she had been anticipating for years, the women laughed out loud and displayed great pleasure with her accomplishment.¹² In addition, Elsa covered her eyes with her hands and made a crooning sound when Danny beat Cherise, even as Yolande shot out questions about whether Cherise would report the abuse and fight for her rights. Reflecting on her life experience, Yolande contemplated the negative consequences that women face when they choose to fight for their rights, consequences that often result in abuse from their husbands; and she followed this remark with a sigh. After recovering from watching Cherise's beating, all four women empathized with Cherise's utter desperation, and they proffered advice at her every turn, articulating new responses each time she appeared on-screen. Proposing that she contact her parents about the abuse or take the baby-girl to an orphanage or clinic rather than leaving her in the street, these women identified closely with Cherise's personal problems and expressed familiarity with situations that appeared hopeless.

Trying to account for why Thandeka, a black woman, was willing to care for a white baby, Yolande speculated that Thandeka's concern for the baby stemmed from the remorse she felt about leaving her daughter with her sister at birth: "she's still guilty right now when she sees [something] like this – that is why she decides to take this child." And when Thandeka asked the clinic doctor what kind of a person would leave her baby in the street, Yolande leaned forward toward the screen and offered "just like you," confirming Thandeka's personal accountability while simultaneously expressing sympathy for Cherise's abandoned baby's cries.

Assuming that *Home Affairs* was realistic, Yolande remarked on a similar situation, in which a white child had been adopted by a black woman, a scenario she felt was representative of most interracial adoptions. Believing that racial differences should not factor into the availability of social assistance, these women
